Legal information

Warning notice system

This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

DANGER

indicates that death or severe personal injury will result if proper precautions are not taken.
--

WARNING
--

indicates that death or severe personal injury may result if proper precautions are not taken.

CAUTION
--

indicates that minor personal injury can result if proper precautions are not taken.
--

NOTICE

indicates that property damage can result if proper precautions are not taken.
--

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel

The product/system described in this documentation may be operated only by **personnel qualified** for the specific task in accordance with the relevant documentation, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products

Note the following:

WARNING
--

Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be complied with. The information in the relevant documentation must be observed.
--

Trademarks

All names identified by ® are registered trademarks of Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability

We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Preface

SINUMERIK documentation

The SINUMERIK documentation is organized into the following categories:

- General documentation/catalogs
- User documentation
- Manufacturer/service documentation

Additional information

You can find information on the following topics at the following address (<https://support.industry.siemens.com/cs/de/en/view/108464614>):

- Ordering documentation/overview of documentation
- Additional links to download documents
- Using documentation online (find and search in manuals/information)

If you have any questions regarding the technical documentation (e.g. suggestions, corrections), please send an e-mail to the following address (<mailto:docu.motioncontrol@siemens.com>).

mySupport/Documentation

At the following address (<https://support.industry.siemens.com/My/ww/en/documentation>), you can find information on how to create your own individual documentation based on Siemens' content, and adapt it for your own machine documentation.

Training

At the following address (<http://www.siemens.com/sitrain>), you can find information about SITRAIN (Siemens training on products, systems and solutions for automation and drives).

FAQs

You can find Frequently Asked Questions in the Service&Support pages under Product Support (<https://support.industry.siemens.com/cs/de/en/ps/faq>).

SINUMERIK

You can find information about SINUMERIK at the following address (<http://www.siemens.com/sinumerik>).

Target group

This publication is intended for project engineers, commissioning engineers, machine operators and service and maintenance personnel.

Benefits

The intended target group can use the Parameter Manual to test and commission the system or the plant correctly and safely.

Utilization phase: Setup and commissioning phase

Standard scope

This documentation describes the functionality of the standard scope. Extensions or changes made by the machine manufacturer are documented by the machine manufacturer.

Other functions not described in this documentation might be executable in the control. This does not, however, represent an obligation to supply such functions with a new control or when servicing.

Furthermore, for the sake of clarity, this documentation does not contain all detailed information about all types of the product and cannot cover every conceivable case of installation, operation or maintenance.

Note regarding the General Data Protection Regulation

Siemens observes standard data protection principles, in particular the principle of privacy by design. That means that

this product does not process / store any personal data, only technical functional data (e.g. time stamps). If a user links this data with other data (e.g. a shift schedule) or stores personal data on the same storage medium (e.g. hard drive) and thus establishes a link to a person or persons, then the user is responsible for ensuring compliance with the relevant data protection regulations.

Technical Support

Country-specific telephone numbers for technical support are provided on the Internet at the following address (<https://support.industry.siemens.com/sc/ww/en/sc/2090>) in the "Contact" area.

If you have any technical questions, use the online form in the "Support Request" area.

Table of contents

	Preface	3
1	Fundamental safety instructions	7
1.1	General safety instructions	7
1.2	Warranty and liability for application examples	8
1.3	Industrial security	9
2	SINUMERIK machine and setting data	11
2.1	Explanation of the machine/setting data	11
2.1.1	Information about the data tables	11
2.1.2	Structure of the data tables	11
2.1.3	Meaning of table fields	12
2.1.4	Overview of the data	18
2.2	Display machine data	21
2.3	NC machine data	25
2.3.1	General machine data	25
2.3.2	Channel-specific machine data	235
2.3.3	Axis-specific machine data	429
2.4	NC setting data	590
2.5	Machine and setting data cycles	647
2.6	Compile cycles	735
3	SINAMICS parameters	757
3.1	Explanation of the parameters	757
3.1.1	Structure of the data tables	757
3.1.2	Meaning of table fields	757
3.1.3	Number ranges of the parameters	761
3.2	SINAMICS parameters	764
A	Appendix A	1799
A.1	List of abbreviations	1799
A.2	Documentation overview SINUMERIK 840D sl	1805
	Index	1807

Fundamental safety instructions

1.1 General safety instructions

WARNING

Danger to life if the safety instructions and residual risks are not observed

If the safety instructions and residual risks in the associated hardware documentation are not observed, accidents involving severe injuries or death can occur.

- Observe the safety instructions given in the hardware documentation.
- Consider the residual risks for the risk evaluation.

WARNING

Malfunctions of the machine as a result of incorrect or changed parameter settings

As a result of incorrect or changed parameterization, machines can malfunction, which in turn can lead to injuries or death.

- Protect the parameterization against unauthorized access.
- Handle possible malfunctions by taking suitable measures, e.g. emergency stop or emergency off.

1.2 Warranty and liability for application examples

Application examples are not binding and do not claim to be complete regarding configuration, equipment or any eventuality which may arise. Application examples do not represent specific customer solutions, but are only intended to provide support for typical tasks.

As the user you yourself are responsible for ensuring that the products described are operated correctly. Application examples do not relieve you of your responsibility for safe handling when using, installing, operating and maintaining the equipment.

1.3 Industrial security

Note

Industrial security

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Products and solutions from Siemens constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the Internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. using firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that can be implemented, please visit:

Industrial security (<https://www.siemens.com/industrialsecurity>)

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they become available, and that only the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customer's exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed at:

Industrial security (<https://www.siemens.com/industrialsecurity>)

Further information is provided on the Internet:

Industrial Security Configuration Manual (<https://support.industry.siemens.com/cs/ww/en/view/108862708>)

WARNING

Unsafe operating states resulting from software manipulation

Software manipulations, e.g. viruses, Trojans, or worms, can cause unsafe operating states in your system that may lead to death, serious injury, and property damage.

- Keep the software up to date.
- Incorporate the automation and drive components into a holistic, state-of-the-art industrial security concept for the installation or machine.
- Make sure that you include all installed products into the holistic industrial security concept.
- Protect files stored on exchangeable storage media from malicious software by with suitable protection measures, e.g. virus scanners.
- On completion of commissioning, check all security-related settings.
- Protect the drive against unauthorized changes by activating the "Know-how protection" converter function.

SINUMERIK machine and setting data

2.1 Explanation of the machine/setting data

2.1.1 Information about the data tables

This List Manual provides information on all the machine and setting data.

A functional description of the data is provided in the Function Manual indicated in the cross reference.

For additional descriptions

Further detailed information is available directly through the online help of the control system.

2.1.2 Structure of the data tables

Standard table

The standard table contains all the important information about a SINUMERIK machine data.

MD number	Identifier			Display filter	Reference	
Unit	Name			Data type	Activation	
Attributes						
System	Dimension	Default value (LIN/RED)	Minimum value (LIN/RED)	Maximum value (LIN/RED)	Protection	Class

Expanded table

The expanded table includes data from the standard table plus additional rows with system-specific values.

MD number	Identifier			Display filter	Reference	
Unit	Name			Data type	Activation	
Attributes						
-	Dimension	Default value (LIN/RED)	Minimum value (LIN/RED)	Maximum value (LIN/RED)	Protection	Class
<System 1>	-	-	-	-	-/-	
<System 2>	-	-	-	-	-1/-	

A minus sign "-" in a field means that the same value as for <System 1> applies for the specified system.

2.1 Explanation of the machine/setting data

The entry "-/-" in the "Protection" field means that the machine data is not available for the specified system.

Example:

19102	NUM_ADD_AXES_IN_SYSTEM			N01	-	
-	Additionally 1 position axis/auxiliary spindle			BYTE	POWER ON	
-						
840dsl-71	-	-	0	8	3/3	I
840dsl-72	-	3	0	31	3/3	I
840dsl-73	-	3	0	31	3/3	I
840dsl-711	-	-	0	8	3/3	I
840dsl-721	-	0	0	31	3/3	I
840dsl-731	-	0	0	31	3/3	I

2.1.3 Meaning of table fields

MD number

The "MD number" field contains the machine data number. This number is displayed in the data lists on the user interface of the control.

Identifier

The "Identifier" field contains the unique alphanumeric identifier of the machine data. The machine data is, for example, addressed by means of this identifier (with an additional label) for programming in the part program.

This identifier is displayed in the data lists on the user interface of the control.

Reference

As a cross reference to the functional description of the data, the "Reference" field contains the short designation of the corresponding chapter of a function manual respectively the short designation of a manual.

Reference is made to the following chapters respectively manuals:

- Function Manual Basic Functions, Chapter: A2, A4, B1, H2, K1, K2, K5, K7, K10, N2, S7, V2, TE7
- Function Manual Axes and Spindles, Chapter: B2, F1, G1, G2, H1, M3, N3, P1, P2, P5, R1, R2, R3, S1, S3, S9, T1, T4, T5, T6, V1
- Function Manual Technologies, Chapter: M5, N4, R3, T3, TE01, TE02, TE1, TE3, TE4, TE6, TE7, TE8
- Function Manual Tools, Chapter: W1, W4, W5

- Function Manual Transformations, Chapter: F2, K12, M1
- Function Manual Monitoring and Compensation, Chapter: A3, A5, K3, K8, K9, K11, TE1, TE9
- Safety Integrated Commissioning Manual, FBSI
- Function Manual Tool Management, FBWsl
- Function Manual Synchronous Actions, FBSY
- Description of Functions, ISO Dialects for SINUMERIK, FBFA
- Programming Manual, PG
- Programming Manual Job Planning, PGA

Unit / system of units

Depending on MD10240 \$MN_SCALING_SYSTEM_IS_METRIC, the physical units differ as follows:

MD10240=1 Metric	MD10240=0 inch
mm	inch
mm/min	inch/min
m/s ²	inch/s ²
m/s ³	inch/s ³
mm/rev.	inch/rev.

If the machine data is not based on any physical unit, the field is marked with "-".

Note

The default setting is MD10240 \$MN_SCALING_SYSTEM_IS_METRIC = 1 (metric)

Name

The "Name" field contains the name of the data in plain text.

Activation

The "Activation" field contains the action that must be performed by the user in order for a change in the data to be activated.

Activation		User action
po	POWER ON	Alternatively: • "Reset (po)" softkey • Switch voltage off/on
cf	NEW_CONF	Alternatively: • Softkey: "Activate MD" Note: Axis-specific machine data A changed value will not be activated until all the channels of the mode group to which the axis belongs to are in the "Reset" state. • Command: <code>NEWCONF</code> Note: Axes/spindles On axes and position-controlled spindles, a changed value is not activated until the respective axis/spindle is stopped. On spindles that are not position-controlled a changed value is activated immediately.
re	RESET	Alternatively: • "Reset (po)" softkey • Channel reset • Mode group reset • Program end reset (M02/M30)
so	IMMEDIATELY	After entering the value

The activation levels are listed according to their priority.

- po = highest priority
- so = lowest priority

Protection

The "Protection" field contains the access levels for reading or writing a data item:

Reading/writing.

The first parameter specifies the access level for reading.

The second parameter specifies the access level for writing.

Example:

"ReadOnly" in the table field means:

Reading with access level "Manufacturer" possible/ **writing** with access level "manufacturer" not possible.

Access level	Type
Read only	Read-only access
0	Siemens (System)

Access level	Type
1	Manufacturer
2	Service
3	User
4	Key-operated switch position 3
5	Key-operated switch position 2
6	Key-operated switch position 1
7	Key-operated switch position 0

Class

The "Class" field contains the data class to which the control-relevant data is assigned.

The data class attributes of machine, setting and option data are normally derived from the write rights of the corresponding data.

The data is divided into the following four data classes:

Data class	Write rights	Access right
S (System)	System	Access level 0 (Password: System)
M (Manufacturer)	Manufacturer/Service	Access levels 1 and 2 and ReadOnly (Password: Service)
I (Individual) Note: Individual machine data is grouped in this data class, e.g. the leadscrew error compensation values. Depending on the contents, these are accessible via different access levels.	Manufacturer/Service or User	Access level 1 and 2 (Password: Service) or Access level 3 (Password: User)
U (User)	User	Access level 3 (Password: User) Access level 4 and 7 (Keyswitch)

Display filter

The "Display filter" field contains the identifier of the data filter setting that enables the data to be displayed. Using the filter setting, the exact data areas required at a given time can be selected for display.

ID	Data area
EXP	Expert mode
Drive-specific machine data	
D00	Display signals
D01	Controller data

2.1 Explanation of the machine/setting data

ID	Data area
D02	Monitoring/limiting functions
D03	Message data
D04	Status data
D05	Motor / power unit
D06	Measuring system
D07	Safety Integrated
D08	Standard machine
General machine data	
N01	Configuration/scaling
N02	Memory configuration
N03	PLC machine data
N04	Drive control
N05	Status data / diagnostics
N06	Monitoring/limiting functions
N07	Auxiliary functions
N08	Corrections/compensations
N09	Technological functions
N10	I/O configuration
N11	Standard machine
A12	NC language, ISO dialect
Channel-specific machine data	
C01	Configuration
C02	Memory configuration
C03	Initial states
C04	Auxiliary functions
C05	Velocities
C06	Monitoring/limiting functions
C07	Transformations
C08	Corrections/compensations
C09	Technological functions
C10	Standard machine
C11	NC language, ISO dialect
Axis-specific machine data	
A01	Configuration (including memory)
A02	Measuring system
A03	Machine geometry
A04	Velocities/accelerations
A05	Monitoring/limiting functions
A06	Spindle
A07	Controller data
A08	Status data
A09	Corrections/compensations
A10	Technological functions

ID	Data area
A11	Standard machine
A12	NC language, ISO dialect
Display-specific machine data	
H01	ShopMill
H02	ShopTurn
H03	ManualTurn
H04	Access levels
H05	Standard machine

System

In the "System" field, the control system is specified for which the data with the correspondingly entered values applies.

The following entries are possible:

- If the system is not listed, the entered default values apply.
- If the system is listed, the deviations are entered in the following table cells.

840dsl-71	NCU710
840dsl-72	NCU720
840dsl-73	NCU730
840dsl-711	NCU710.3B
840dsl-721	NCU720.3B
840dsl-731	NCU730.3B

Dimension

The "Dimension" field contains the number of elements of a data field.

Default value

The "Default value" field contains the value that is used to preset the machine data.

Some machine data is preset with different default values, depending on the NCU that is used.

Note

When input via the user interface, this is limited to ten digits plus comma and sign.

In the bracket "LIN/RED" the linear axis or rotary axis value is specified.

Range of values

The "Minimum value" and "Maximum value" fields contain the lower limit and upper limit, respectively, of the permissible data range.

If the "Minimum value" and "Maximum value" fields contain the string " *** ", an explicit range is not defined for this data. In this case, the range is determined by the specified data type.

SINUMERIK data types

The "Data type" field contains the following data types:

Data type	Range of values
BOOLEAN	false, true
BYTE	-128 to +127
UBYTE	0 to +255
DWORD	-2,147,483,648 to +2,147,483,647
UDWORD	0 to +4,294,967,295
DOUBLE	$-1.7 \cdot 10^{308}$ to $+1.7 \cdot 10^{308}$
STRING	Sequence of characters (→ UBYTE) with any arbitrary/specified length.

Attributes

The "Attributes" field contains additional attributes of the data:

Attribute	Description	
NBUP	No Back UP:	The data is not backed up as part of the data backup.
ODLD	Only DownLoaD:	The data can only be written to via an ini file, archive, or from the part program.
NDLD	No DownLoaD:	The data can only be written to via the user interface.
SFCO	SaFety COnfigura-tion:	Component of the "Safety Integrated" function.
SCAL	SCaling ALarm:	Scaling data; when changed, alarm 4070 is displayed
LINK	LINK description:	The data describes a link cluster, component of the "NCU Link" function
CTEQ	ConTainer EQual:	The data must be the same for all axes of an axis container, component of the "Axis container" function
CTDE	ConTainer DEscrip-tion:	The data describes an axis container, component of the "Axis container" function

2.1.4 Overview of the data

Number ranges SINUMERIK

The machine and setting data are divided into number ranges.

The identifier specified in the data description is displayed on the user interface. However, if the data is addressed in the part program, for example, the identifier of the relevant data area must precede the data identifier.

Data area		Identifier	Description
From	to		
9000	9999	\$MM_	Display machine data
10000	18999	\$MN_	General NC machine data and general machine data for Safety Integrated
19000	19999	\$ON_	Option data
20000	28999	\$MC_	Channel-specific machine data
29000	29999	\$OC_	Channel-specific option data
30000	38999	\$MA_	Axis-specific machine data and axis-specific machine data for Safety Integrated
39000	39999		Reserved
41000	41999	\$SN_	General setting data
42000	42999	\$SC_	Channel-specific setting data
43000	43999	\$SA_	Axis-specific setting data
51000	51299	\$MNS_	General configuration machine data
51300	51999		General cycle machine data
52000	52299	\$MCS_	Channel-specific configuration machine data
52300	52999		Channel-specific cycle machine data
53000	53299	\$MAS_	Axis-specific configuration machine data
53300	53999		Axis-specific cycle machine data
54000	54299	\$SNS_	General configuration setting data
54300	54999		General cycle setting data
55000	55299	\$SCS_	Channel-specific configuration setting data
55300	55999		Channel-specific cycle setting data
56000	56299	\$SAS_	Axis-specific configuration setting data
56300	56999		Axis-specific cycle setting data

Data Identifiers

Characters	Meanings
\$	System variables
M	Machine data (first letter)
S	Setting data (first letter)
O	Option data (first letter)
M, N, C, A	Subarea (second letter)
S	Siemens data (third letter)

Note

Axis-specific data can also be addressed with the axis name as an index. The internal axis identifier (AX1, AX2, AX3, etc.) or the identifier specified in MD10000 \$MN_AXCONF_MACHAX_NAME_TAB can be used as the axis name.

Example:

\$MC_JOG_VELO[Y1]=2000

The JOG velocity of axis Y1 is 2000 mm/min.

Example:

\$MA_FIX_POINT_POS[0,X1]=500.000

The value 500 is assigned to the first fixed point position on axis 1.

Examples:

\$MN_AUXFU_GROUP_SPEC[2]='H41'

If the content of a machine data is a STRING (e.g. Y1) or a hexadecimal value (e.g. H41) the contents must lie between " " (e.g. 'H41').

Output instant in time of the auxiliary functions of the 3rd auxiliary function group.

\$MN_AXCONF_MACHAX_NAME_TAB[0]='X1'

String "X1" is assigned as name for the first machine axis.

\$MA_REFP_SET_POS[0,X1]=100.00000

A value of 100 mm is assigned to the first reference point of axis X1.

Examples:

Assignment to channel-specific machine data:

CHANDATA (1)	; Selection of the first channel
\$MC_CHAN_NAME='CHAN1'	; Name of the first channel
\$MC_AXCONF_GEOAX_NAME_TAB[1]='Y'	; Name of the 2nd geometry axis
	; of the first channel 'Y'
R10=33.75	; R10 of the first channel

2.2 Display machine data

9006	DISPLAY_SWITCH_OFF_INTERVAL	-	-
-	Time for screen saver	DWORD	PowerOn
-			
-	-	60	0
		180	7/3
			M

Description: This machine data specifies the duration in minutes after which the screen automatically switches to dark if no key has been pressed on the keyboard in the meantime.

The value 0 disables automatic light/dark switching.

Note:

The screen is only switched light/dark automatically if the NC/PLC interface signal DB19, ... DBX0.1 (screen dark) = 0.

9009	KEYBOARD_STATE	-	-
-	Keyboard shift behavior at booting	BYTE	PowerOn
-			
-	-	0	0
		2	7/3
			M

Description: This machine data defines the Shift behavior (SW-CAPSLOCK) of the keyboard.

Basic configuration of the Shift behavior of the keyboard

0: SW-CAPSLOCK OFF

2: SW-CAPSLOCK ON

9032	HMI_MONITOR	-	-
-	Define PLC data for HMI screen info	STRING	PowerOn
-			
-	-	-	-
			7/1
			M

Description: Pointer, with offset, to a PLC data block. This is required to report HMI monitor information to the PLC, e.g active HMI task.

Format: PLC-specific format for specifying a data block with byte offset, e.g. DB60.DBB10 for data block 60, byte 10.

The monitor information reported by the HMI has a maximum length of 8 bytes.

9056	ALARM_ROTATION_CYCLE	-	-
-	Rotation cycle time for alarm display	DWORD	PowerOn
-			
-	-	0	0
		10000	7/3
			M

Description: Rotation cycle time in the alarm display:

<500: no rotation in the alarm line

500 - 10000: cycle duration of alarm rotation in milliseconds

If a valid cycle time has been set, all alarms are displayed in the alarm line one after the other.

Each alarm is displayed for the specified time until it is replaced by the next alarm.

If no alarm is present, cycle alarms or program messages are displayed, if required. However, these do not rotate.

2.2 Display machine data

9057	ENABLE_CHANNEL_MSG_FILTER	-	-
-	Filter program messages channel specifically	BOOLEAN	PowerOn
-			
-	-	1	-
-	-	-	7/3
-	-	-	M

Description: 0: The program messages of all channels are displayed in the alarm/message line.
 With multiple NCUs, the alarms and messages of all NCUs are displayed by default.
 The display can be restricted to the current NCU by the setting ServerMode Enabled=false in slaesvcconf.xml.
 1: Only the program messages of the current channel of the current NCU are displayed.

9100	CHANGE_LANGUAGE_MODE	-	-
-	Language selection mode	BYTE	Immediately
-			
-	-	1	1
-	-	2	7/3
-	-	1	I

Description: Language selection mode is defined:
 1 = directly via selection list
 2 = via setting of the 1st and 2nd language

9102	SHOW_TOOLTIP	-	-
-	Display tooltip	BYTE	Immediately
-			
-	-	1	0
-	-	1	7/3
-	-	1	U

Description: If the MD has been set to 1, tooltips will be displayed.

9103	TOOLTIP_TIME_DELAY	-	-
s	Time delay tooltip display	BYTE	Immediately
-			
-	-	1	0
-	-	60	7/3
-	-	1	U

Description: Time delay for display of the tooltips in seconds.

9104	ANIMATION_TIME_DELAY	-	-
s	Time delay before animation of help screens	BYTE	Immediately
-			
-	-	10	5
-	-	60	7/3
-	-	1	U

Description: Time delay until the start of animation of help screens in seconds.
 The setting is not active for help screens that are exclusively animated.

9105	HMI_WIDE_SCREEN	-	-
-	Display of the HMI as wide screen with OEM area always visible	BYTE	PowerOn
-			
-	-	0	0
-	-	1	7/2
-	-	1	M

Description: Display of the HMI as wide screen. Above the HMI there is a separate application field that is designed by the machine manufacturer.

9106	SERVE_EXTCALL_PROGRAMS	-	-
-	Process EXTCALL calls	BYTE	PowerOn
-			
-	-	1	0
-	-	3	7/3

2.3 NC machine data

2.3.1 General machine data

10000	AXCONF_MACHAX_NAME_TAB			N01, N11	K2, F1, G2, F2, K5, M1	
-	Machine axis name			STRING	PowerOn	
-						
-	31	X1, Y1, Z1, A1, B1, C1, U1, V1	-	-	7/2	M

Description:

List of the machine axis identifiers

The name of the machine axis is entered in this MD.

In addition to the fixed, defined machine axis identifiers "AX1", "AX2" ..., user-defined identifiers for the machine axes can also be assigned in this data.

The identifiers defined here can be used parallel to the fixed, defined identifiers for addressing axial data (e.g. MD) and machine axis-related NC functions (reference point approach, axial measurement, travel to fixed stop).

Special cases:

- The input machine axis name must not conflict with the names and assignments of the geometry axes (MD20060 \$MC_AXCONF_GEOAX_NAME_TAB, MD20050 \$MC_AXCONF_GEOAX_ASSIGN_TAB) and channel axes (MD20080 \$MC_AXCONF_CHANAX_NAME_TAB, MD20070 \$MC_AXCONF_MACHAX_USED).

The input machine axis name must not conflict with

Names for Euler angles (MD10620 \$MN_EULER_ANGLE_NAME_TAB)

Names for path-relevant orientations (MD10624 \$MN_ORIPATH_LIFT_VECTOR_TAB)

Names for normal vectors (MD10630 \$MN_NORMAL_VECTOR_NAME_TAB)

Names for direction vectors (MD10640 \$MN_DIR_VECTOR_NAME_TAB)

Names for rotation vectors (MD10642 \$MN_ROT_VECTOR_NAME_TAB)

Names for intermediate vector components (MD10644 \$MN_INTER_VECTOR_NAME_TAB)

Names for intermediate circle point coordinates for CIP (MD10660 \$MN_INTERMEDIATE_POINT_NAME_TAB)

Names for interpolation parameters (MD10650 \$MN_IPO_PARAM_NAME_TAB).

- The input machine axis name must not include any of the following reserved address letters:

D Tool offset (D function) E Reserved

F V Feedrate (F function) G Path condition

H Auxiliary function (H function) L Subroutine call

M Miscellaneous function (M function) N Subblock

P Subroutine number of passes R Arithmetic parameters

S Spindle speed (S function) T Tool (T function)

The name must not include any keywords (e.g. DEF, SPOS etc.) or pre-defined identifiers (e.g. ASPLINE, SOFT).

The use of an axis identifier consisting of a valid address letter (A, B, C, I, J, K, Q, U, V, W, X, Y, Z), followed by an optional numerical extension (1-99) gives slightly better block change times than a general identifier.

If no identifier is assigned to a machine axis, the predefined name ("AXn") applies to the nth machine axis).

Related to....

MD20060 \$MC_AXCONF_GEOAX_NAME_TAB (geometry axis name in the channel [GEOAxisno.]

2.3 NC machine data

MD20080 \$MC_AXCONF_CHANAX_NAME_TAB (channel axis name in the channel [Channelaxisno.]

10002	AXCONF_LOGIC_MACHAX_TAB			N01	B3, K2	
-	Logical NCK machine axis image			STRING	PowerOn	
-						
-	31	AX1, AX2, AX3, AX4, AX5, AX6, AX7, AX8...	-	-	3/2	M

Description:

List of machine axes available on an NCU. (Logical NCK machine axis image)

MD10002 \$MN_AXCONF_LOGIC_MACHAX_TAB creates another NCK global, logical layer between the channel axis layer and the machine axes in an NCU or NCU grouping. This layer is called the "Logic NckMachineAxImage", abbreviation: LAI).

Axes can only be assigned between different NCUs via this new intermediate layer!

The entry MD10002 \$MN_AXCONF_LOGIC_MACHAX_TAB[n] = NCj_AXi assigns the machine axis i on the NCU j to the axis index "n" in the LAI.

This makes the following assignments possible:

1. Local axes (default setting: AX1, AX2 ... AX31)

The entry MD10002 \$MN_AXCONF_LOGIC_MACHAX_TAB[n] = AX3 assigns the local axis AX3 to axis index n. (Default setting AX3 is present for n = 3 . Thus there is compatibility in software version 5 for MD blocks for software versions up to 4).

2. Link axes (axes that are physically connected to another NCU). The entry MD10002 \$MN_AXCONF_LOGIC_MACHAX_TAB[n] = NCj_AXi assigns axis AXi (link axis) on NCU j to axis index n.

Limits:

n Machine axis address (of the local NCU) 1 ... 31

j NCU number 1 ... 16

i Machine axis address (of the local/remote NCU) 1 ... 31

3. Axis container in which there are once again either local or link axes. The entry MD10002 \$MN_AXCONF_LOGIC_MACHAX_TAB[n] = CTr_SLs assigns container r and slot s to axis index n.

Limits:

n Machine axis address (of the local NCU) 1 ... 31

r Container number 1 ... 16

s Slot number (location) in the container 1 ... 32

The channel layer is formed via the related machine data \$MD20070

\$MC_AXCONF_MACHAX_USED and no longer points (small P5) directly to the machine axes but to the new LAI layer.

MD20070 \$MC_AXCONF_MACHAX_USED [k]=n assigns the LAI axis number "n" to the axis index "k" in the channel layer.

The machine axis and the corresponding NCK can then be determined from the LAI axis number.

If a number of NCUs point to the same machine axis in the cluster as a result of MD10002 \$MN_AXCONF_LOGIC_MACHAX_TAB, then the axial machine data MD30554

\$MA_AXCONF_ASSIGN_MASTER_NCU must define which NCU generates the master NCU and the setpoint values for the position controller after startup.

Related to:

MD12... \$MN_AXCT_AXCONF_ASSIGN_TABi (make entries in containers i)

10010	ASSIGN_CHAN_TO_MODE_GROUP			N01, N02, N11	K1, K5	
-	Channel valid in mode group			DWORD	PowerOn	
-						
-	10	1, 0, 0, 0, 0, 0, 0, 0...	0	10	7/2	M

Description:

This MD assigns the channel to a mode group

Entry value 1 => Assigned to 1st mode group

Entry value 2 => Assigned to 2nd mode group

etc.

From software version 4, it is permissible not to assign a mode group number to individual channels.

Channel gaps are allowed, in order to favor uniform configuration in similar types of machines. In this case, the number 0 is assigned to the channel instead of assigning a mode group number equal to or greater than 1. The channel is not activated, however it is handled like an active channel when counting the channels.

E.g.

```
ASSIGN_CHAN_TO_MODE_GROUP[0] = 1
ASSIGN_CHAN_TO_MODE_GROUP[1] = 1
ASSIGN_CHAN_TO_MODE_GROUP[2] = 0    ; gap
ASSIGN_CHAN_TO_MODE_GROUP[3] = 1
```

Application example:

Select desired channel via HMI and enter with MD10010 \$MN_ASSIGN_CHAN_TO_MODE_GROUP = 1.

Note:

This MD must still be entered even when only one mode group is present.

10050	SYSCLOCK_CYCLE_TIME			N01, N05, N11	G3, G2, R1	
s	System clock cycle			DOUBLE	PowerOn	
SFCO						
-	-	0.002	0.0005	0.008	7/2	M

Description:

Basic cycle time of the system software

The cycle time settings of cyclical tasks (position controller/IPO) are multiples of this basic cycle.

For PROFIBUS/PROFINET:

In the case of systems with a PROFIBUS DP connection, this MD corresponds to the PROFIBUS DP cycle time. This time is read from the configuration file (SDB-Type-2000) during startup and written to the MD.

This MD can only be changed via the configuration file.

Note:

Reducing this MD can result in an automatic correction of

MD10062 \$MN_POSCTRL_CYCLE_DELAY

MD10064 \$MN_POSCTRL_CYCLE_DESVAL_DELAY

that cannot be undone by a subsequent increase!

Details:

The basic cycle is incremented in multiples of units of the measured value sampling cycle. When the system powers up, the entered value is automatically rounded to a multiple of this incrementation.

Note:

Discrete timer division ratios can give rise to the entered value producing a value that is not an integer after a Power OFF/ON.

For example:

Input	=0.005s	
	after power OFF/ON	=0.00499840
	or	
Input	=0.006s	
	after power OFF/ON	=0.0060032

2.3 NC machine data

10061	POSCTRL_CYCLE_TIME	N01, N05	G3
s	Position control cycle	DOUBLE	PowerOn
-			
-	-	0.0	-MD_DBLMAX 1.0E+301 ReadOnly S

Description: Position controller cycle time:
Display of the position controller cycle time

10062	POSCTRL_CYCLE_DELAY	N01, N05	G3
s	Position control cycle offset	DOUBLE	PowerOn
-			
-	-	0.0	0.000 0.008 7/2 M

Description: For PROFIdrive only:
Only relevant to operation with PROFIBUS drives.
Position controller cycle offset in relation to the PROFIBUS DP cycle.
Offsets that exceed the set DP cycle or are smaller than the maximum Tdx, are automatically corrected to a substitute value half the size of the DP cycle.
MD10062 \$MN_POSCTRL_CYCLE_DELAY > 0: Default for position controller offset
MD10062 \$MN_POSCTRL_CYCLE_DELAY = 0: Automatic determination of the position controller offset with max. Tdx from STEP7 project
Tdx_max is determined through all equidistant buses.
The actually active offset value is displayed in MD 10063[1]
\$MN_POSCTRL_CYCLE_DIAGNOSIS.
Note:
MD10062 \$MN_POSCTRL_CYCLE_DELAY > 0 can reduce MD10050 \$MN_SYSCLOCK_CYCLE_TIME to the automatic correction of this MD that cannot be undone by a subsequent increase.
Recommendation:
In this case set the original value or default value once again.

10063	POSCTRL_CYCLE_DIAGNOSIS	EXP, N01, N05	-
s	Active timing	DOUBLE	PowerOn
-			
-	6	0.0, 0.0, 0.0, 0.0, 0.0, 0.0	-MD_DBLMAX 1.0E+301 ReadOnly M

Description: Diagnostic data related to the PROFIBUS/PROFINET cycle.
[0]: Latest time at which the actual values should be available (Tdx)
[1]: Actually active position controller cycle offset (Tm)
[2]: Latest time at which the setpoints were output by the position controller
[3]: Time at which the setpoint transfer to the drive via DMA was started for SOC-based modules
[4]: Time at which the setpoint transfer to the drive via DMA was finished for SOC-based modules.
[5]: 'Worst case' time since voltage on, at which the setpoint transfer to the drive via DMA was finished for SOC-based modules.
Diagnostic data are initialized with ZERO with each NCK power up

10064	POSCTRL_CYCLE_DESVAL_DELAY	N01, N05	G3
s	Clock skew of the DMA for the setpoints	DOUBLE	PowerOn
-			
-	-	0.0	0.000 0.008 7/2 M

Description: For SINAMICS-Integrated only:

Only relevant to operation with SINAMICS-Integrated drives on SOC modules.

Offset of the output of the setpoints via DMA in relation to the PROFIBUS DP cycle.

Modification of MD10064 POSCTRL_CYCLE_DESVAL_DELAY requires a warm restart of the NCK and drive.

Offsets that exceed the set DP cycle are automatically corrected to a substitute value.

MD10062 \$MN_POSCTRL_CYCLE_DESVAL_DELAY > 0: Default setpoint offset

MD10062 \$MN_POSCTRL_CYCLE_DESVAL_DELAY = 0: Automatic determination of the setpoint offset on the basis of the hardware transfer rates

The actually active offset value is displayed in MD10063

\$MN_POSCTRL_CYCLE_DIAGNOSIS[4].

Note:

MD10064 \$MN_POSCTRL_CYCLE_DESVAL_DELAY > 0 can reduce MD10050 \$MN_SYSCLOCK_CYCLE_TIME to the automatic correction of this MD, which cannot be undone by a subsequent increase.

Recommendation:

In this case, set the original value or default value again.

10070	IPO_SYSCLOCK_TIME_RATIO			N01, N05, N11	G3, R1	
-	Factor for interpolation cycle			DWORD	PowerOn	
SFCO						
-	-	4	1	100	7/2	M

Description: The interpolator cycle is stated as a multiple of the time units of the system basic cycle MD10050 \$MN_SYSCLOCK_CYCLE_TIME.

Only integer multiples of the position control cycle can be set. Values that are not an integer multiple of the position control cycle are automatically increased to the next integer multiple of the position control cycle before they become active (on next power up).

This is accompanied by alarm 4110 "IPO cycle changed to [] ms".

10071	IPO_CYCLE_TIME			N01, N05, N11	G3	
s	Interpolator cycle			DOUBLE	PowerOn	
-						
-	-	0.0	-MD_DBLMAX	1.0E+301	ReadOnly	S

Description: Interpolation time

Display of the interpolator cycle time

10072	COM_IPO_TIME_RATIO			N01, N05	-	
-	Division ratio between IPO and communication task			DOUBLE	PowerOn	
-						
-	-	1.0	0.0	100.0	7/2	M

Description: Division ratio between IPO and communication tasks. A value of 2 means, e.g., that the communication task is only processed in every second IPO cycle. This makes more time available for the other tasks. Overlarge values slow down the communication between the HMI and NCK.

Numerical values less than 1 downscale the IPO cycle. This value is adjusted so that only runtimes that are a multiple of the position controller time are possible for the communication task. A call period of about 10 ms is practical for the communication task.

2.3 NC machine data

10088	REBOOT_DELAY_TIME			EXP	K3	
s	Reboot delay			DOUBLE	Immediately	
-						
-	-	0.2	0.0	1.0	2/2	M

Description:

The reboot following PI "_N_IBN_SS" is delayed by the time MD10088 \$MN_REBOOT_DELAY_TIME.

The suppressable NOREADY alarm 2900 is triggered immediately by PI "_N_IBN_SS".

If MD10088 \$MN_REBOOT_DELAY_TIME falls below the MD36620 \$MA_SERVO_DISABLE_DELAY_TIME value of an axis, the axis is decelerated during MD10088 \$MN_REBOOT_DELAY_TIME. The servo enable is then disabled. That is, the full MD36620 \$MA_SERVO_DISABLE_DELAY_TIME is NOT waited.

Alarm 2900 does not become active if MD10088 \$MN_REBOOT_DELAY_TIME = 0.0, and there is no reboot delay.

The NCK waits beyond the stated delay time until the PI has been able to be acknowledged to the HMI. The total delay time may be as much as 2 s.

10089	SAFE_PULSE_DIS_TIME_BUSFAIL			N01, N06	FBSI	
s	Delay time pulse suppr. for bus failure			DOUBLE	PowerOn	
-						
-	-	0.0	0	0.8	7/2	M

Description:

Time after a communication failure with the drive at which safe pulse disable takes place. The drive can still respond autonomously to the bus failure during this time (see extended stop and retract)

In the following cases, this time is not allowed to elapse before disabling pulses:

- On selection of an external Stop A or a test stop
- If SBH is active or on selection of SBH
- If an SG level is active or on selection of an SG level for which an immediate pulse disable is parameterized in MD36961 \$MA_SAFE_VELO_STOP_MODE or MD36963 \$MA_SAFE_VELO_STOP_REACTION.

Note:

This value is transferred to the drive parameter p9580 with the copy function of the SI-MD and compared in the data cross-check. This general machine data is contained in the axis-specific checksum calculation of the safety-related machine data (MD36998 \$MA_SAFE_ACT_CHECKSUM, MD36999 \$MA_SAFE_DES_CHECKSUM).

10090	SAFETY_SYSCLOCK_TIME_RATIO			N01, N06	FBSI	
-	Factor for monitoring cycle			DWORD	PowerOn	
SFCO						
-	-	3	1	50	7/1	M

Description:

Ratio between the monitoring cycle and the system clock cycle. The monitoring cycle is the product of this data and MD10050 \$MN_SYSCLOCK_CYCLE_TIME.

The monitoring cycle is checked during power on:

- It must be an integer multiple of the position-control cycle
- It must be < 25 ms

The factor is rounded down to the next possible value if the conditions are not fulfilled. The actual set monitoring cycle is displayed by MD10091 \$MN_INFO_SAFETY_CYCLE_TIME.

A new value is also generated for the cross-check cycle, which is displayed by data MD10092 \$MN_INFO_CROSSCHECK_CYCLE_TIME.

Note:

The monitoring cycle defines the monitoring response time. It must be noted that the CPU load increases as the monitoring cycle becomes shorter.

Related to:

MD10050: \$MN_SYSCLOCK_CYCLE_TIME

MD10091: \$MN_INFO_SAFETY_CYCLE_TIME

MD10092: \$MN_INFO_CROSSCHECK_CYCLE_TIME

MD36992: \$MA_SAFE_CROSSCHECK_CYCLE

10094	SAFE_ALARM_SUPPRESS_LEVEL			EXP, N06, N05	FBSI	
-	Alarm suppress level			BYTE	PowerOn	
-						
-	-	2	0	113	7/2	M

Description:

Affects the display of safety alarms. The monitoring channels NCK and drive or NCK and PLC display alarms with the same meaning in several situations.

To reduce the volume of the alarm display, this MD is set to define whether safety alarms with the same meaning are to be hidden or not. This does not affect the dual-channel stop response.

0 = Dual-channel triggered alarms are displayed in full

2.3 NC machine data

- Dual-channel display of all axis-specific safety alarms
- Alarm 27001, error code 0 is displayed
- Alarms 27090, 27091, 27092, 27093, and 27095 are dual-channel and are displayed several times.

1 = Alarms with the same meaning are only displayed once.

The following alarms can be affected by this:

27010 = C01707

27011 = C01714

27012 = C01715

27013 = C01706

27020 = C01710

27021 = C01709

27022 = C01708

27023 = C01701

27024 = C01700

In the case of these alarms, only one of the alarms listed (270xx or C01xxx) is triggered.

The alarm of the monitoring channel that triggers the alarm with the same meaning at a later time is no longer displayed.

Furthermore, alarm 27001 with error code 0 is suppressed. This alarm is triggered as a result of drive alarm C01711. In this case, drive parameters r9710[0,1], r9711[0,1], r9735[0,1], r9736[0,1], r9737[0,1], r9738[0,1], r9739[0,1] provide further information about the cause of the error.

2 = Default setting

In addition to the functionality with MD value = 1, the alarms from SPL processing (27090, 27091, 27092, 27093, and 27095) are displayed in one channel and only once. This also applies to the alarms for PROFIsafe communication (27250 and following).

3 = Axis-specific alarms 27000 and A01797 are replaced by alarm message 27100 for all axes / drives. Alarm 27040 is replaced by alarm 27140 for all axes/ drives.

12 = The alarms are prioritized beyond the functionality with MD value = 2. Obvious subsequent alarms are no longer displayed or are automatically cleared from the display.

The following alarms can be affected by this:

27001, 27004, 27020, 27021, 27022, 27023, 27024, 27091,

27101, 27102, 27103, 27104, 27105, 27106, 27107

13 = The alarms are prioritized beyond the functionality with MD value = 3 (as with MD value 12).

1xx (100 digit set) = Axis-specific checksum alarms of the NCK (27032, 27035, and 27060) are displayed in SPL setup mode (MD11500 \$MN_PREVENT_SYNACT_LOCK[0,1] = 0) by alarm 27135 for all axes.

This machine data must be set to 0 to create an acceptance log, so that the triggering of all alarms can be logged.

SGE differences between NCK and drive monitoring channels are not displayed

Bit 0 = 1:

Default setting: SGE differences between NCK and drive monitoring channels are displayed. Differences between the following SGEs are displayed (the bit numbers stated refer to the axis-specific map of the SGEs; they correspond to the assignment of the axis-specific VDI interface:

Bit 0: DB31, ... DBX22.0 (SBH/SG deselection)

Bit 1: DB31, ... DBX22.1 (SBH deselection)

Bit 3: DB31, ... DBX22.3 (SG selection: Bit 0)

Bit 4: DB31, ... DBX22.4 (SG selection: bit 1)

Bit 12: DB31, ... DBX23.4 (activate SE 2)

Bit 28: DB31, ... DBX33.4 (SG correction: bit 0)

Bit 29: DB31, ... DBX33.5 (SG correction: bit 1)

Bit 30: DB31, ... DBX33.6 (SG correction: bit 2)

Bit 31: DB31, ... DBX33.7 (SG correction: bit 3)

The differences are displayed by message alarm 27004.

Bit 1 = 0: Default setting: Display of a non-executed SPL start after expiration of the time set in MD13310 \$MN_SAFE_SPL_START_TIMEOUT with alarm 27097

Bit 1 = 1: Display of alarm 27097 is suppressed

Alarm 27097 indicates that despite the SPL configuration an SPL start has not been executed after expiration of the time set in MD13310 \$MN_SAFE_SPL_START_TIMEOUT. Alarm description 27097 explains why.

Bit 2 = 0: Default setting: Communication errors are displayed with SFC error codes in alarm 27354

Bit 2 = 1: Display of alarm 27354 is suppressed

Bit 3 = 0: Default setting: alarm 27038 is displayed if an unknown bit is set in drive parameter r474.

Bit 3 = 1: Display of alarm 27038 is suppressed

10097	SAFE_SPL_STOP_MODE			N01, N06	FBSI	
-	Stop reaction for SPL errors			BYTE	PowerOn	
-						
-	-	3	3	4	7/2	M

2.3 NC machine data

Description: Selection of the stop response when errors are detected in the NCK / PLC SPL cross-check.

3: Stop D

4: Stop E

Entering the value 4 in this MD (Stop E), without external Stop E being enabled in all axes with SI function enable (MD36901 \$MA_SAFE_FUNCTION_ENABLE not equal to 0), results in alarm 27033 with a reference to this MD.

As a remedy, either Stop D must be parameterized again, or bits 4 and 6 must be set in MD36901 \$MA_SAFE_FUNCTION_ENABLE for all affected axes.

If this MD is set to 4, the PLC signal DB18 DBX36.1 (Stop E) must also be set to 1 to make this parameterization known to the PLC. Different parameterization results in alarm 27090.

10098	PROFISAFE_IPO_TIME_RATIO			N01, N10	FBSI	
-	Factor for PROFIsafe communication			DWORD	PowerOn	
SFCO						
-	-	1	1	25	7/1	M

Description: Ratio between PROFIsafe communication and interpolator cycle. The actual PROFIsafe communication cycle is the product of this data and MD10071 \$MN_IPO_CYCLE_TIME, and is displayed in MD10099 \$MN_INFO_PROFISAFE_CYCLE_TIME. The OB40 on the PLC side is triggered from the NCK side in this cycle to run the communication between F master and F slaves.

The PROFIsafe communication must not exceed 25 ms.

10099	INFO_PROFISAFE_CYCLE_TIME			N01, N10, N05	FBSI	
s	PROFIsafe communication cycle time			DOUBLE	PowerOn	
-						
-	-	0.0	-	-	ReadOnly	S

Description: Display data:

Displays the maximum time frame within which communication is performed between the F master and F slave. In this time frame, PROFIsafe communication is operated on the PLC via OB40.

The value is derived from the interpolator cycle and MD10098 \$MN_PROFISAFE_IPO_TIME_RATIO.

If the selected communication cycle is exceeded in cyclic operation, this is also displayed here.

In the case of a parameterization error (communication cycle exceeds the maximum value of 25.0 ms), the maximum value that can be set is displayed.

10100	PLC_CYCLIC_TIMEOUT			EXP, N01, N06	P3	
s	Maximum PLC cycle time			DOUBLE	PowerOn	
-						
-	-	0.1	0.0	1.0E+301	7/2	M

Description: Cyclical PLC monitoring time.

This machine data specifies the maximum monitoring time after which the PLC must have incremented its sign of life. Incrementing takes place within the interpolation cycles.

10110	PLC_CYCLE_TIME_AVERAGE			N01, N07	B1	
s	Average PLC acknowledgment time			DOUBLE	PowerOn	
-						
-	-	0.05	0.0	1.0E+301	7/2	M

Description: Time information for the CNC about the OBI cycle time. During this cycle time, it is guaranteed that the auxiliary functions will be acknowledged.

By means of the MD, the status transitions:

"channel operates/ channel in RESET/ channel failure --> channel interrupted" can be delayed for the PLC in case of a RESET. With the output "channel interrupted", the NCK waits at least the time indicated in the MD + 1 IPO cycle.

With the time indication, the path feedrate during path control operation in case of an auxiliary function output during motion is controlled in a way to ensure that the minimum travel time corresponds to the time information. This ensures a uniform velocity behavior which is not disturbed by waiting for the PLC acknowledgment. The internal incrementation is performed in the interpolation cycle.

For the auxiliary function output in the continuous-path mode, the MD is also relevant for the FM357 and 802/802s systems. With SW 5.1 and higher, the other systems are parameterized directly via the PLC.

10120	PLC_RUNNINGUP_TIMEOUT			EXP, N01, N06	H2	
s	Monitoring time for PLC power up			DOUBLE	PowerOn	
-						
-	-	50.0	0.0	1.0E+301	7/2	M

Description: Power up PLC monitoring time

This machine data specifies the maximum monitoring time within which the PLC must report its first sign of life to the NCK. During the power up routine, the monitoring function has the task of verifying that the PLC has properly assumed cyclic operation. If the PLC does not issue a message within this time, the NC issues an alarm message when it powers up; NC-READY is not set. The incrementing takes place within the interpolation cycles.

10125	EES_NC_NAME			EXP	-	
-	NCU name for the generation of unique NC program names in EES mode			STRING	PowerOn	
-						
-	-	-	-	-	7/2	M

Description: The user can assign a unique NCU name to each NCU with MD10125 \$MN_EES_NC_NAME. Similarly to \$P_CHANNO, this can then be used to generate unique NCU program names in EES mode.

Example: \$MN_EES_NC_NAME="NC1"

```
DEF STRING[31] FILENAME
FILENAME = "MYFILE_" << $MN_EES_NC_NAME << "_" << $P_CHANNO << ".SPF"
```

The variable FILENAME is then given the value "MYFILE_NC1_1.SPF" in the first channel on the NCU "NC1".

Background:

In EES mode, the part program memory can be located on a network drive which is accessed by multiple NCUs. Conflicts could be generated with the part program commands WRITE and DELETE if unique file names are not used. The generation of unique NCU program names in the user program is supported by MD10125 \$MN_EES_NC_NAME.

10127	EES_MOUNT_FILE			EXP	-	
-	Path and name of the file with the mounted drives			STRING	PowerOn	
-						
-	-	/user/sinumerik/mnt/ devices.lst	-	-	ReadOnly	S

Description: File name with path name under which the list of mounted drives is stored.

2.3 NC machine data

10128	EES_MAX_MOUNT_TIME	N05	-
s	Maximum time for mounting the drives	DOUBLE	PowerOn
-			
-	-	0	0
		3600	1/1
			M

Description: MD10128 \$MN_EES_MAX_MOUNT_TIME is used to configure the maximum waiting time in seconds for mounting the drives.

\$MN_EES_MAX_MOUNT_TIME > 0:
If the time in seconds is insufficient, then the drives are not detected, and the control powers up with alarm 6694 "Drives could not be mounted".

\$MN_EES_MAX_MOUNT_TIME = 0:
If the drives could not be mounted during control power on, then the control powers up without an alarm. The mounted drives are then declared to the control at each part program start.

Condition: The function "Execution from External Storage" is active.

10131	SUPPRESS_SCREEN_REFRESH	EXP	A2
-	Screen refresh response under overload	BYTE	PowerOn
-			
-	-	0	0
		2	7/2
			M

Description: There are part programs in which the main run (HL) has to wait until the pre-processing (VL) makes new blocks available.

The pre-processing and display update compete for NC computing time. The MD defines how the NC is to respond when the pre-processing is too slow.

0: When the VL of a channel is too slow, the updating of the display is suppressed in all channels.

1: When the VL of a channel is too slow, the updating of the display is suppressed only in the time-critical channels in order to gain time for the pre-processing.

2: The updating of the display is never suppressed.

10132	MMC_CMD_TIMEOUT	EXP, N01, N06	PA, M4
s	Monitoring time for HMI command in the part program	DOUBLE	PowerOn
-			
-	-	3.0	0.0
		100.0	7/2
			M

Description: Monitoring time in seconds until the HMI acknowledges a command from the part program. The following times are monitored:

- In the case of an HMI command without acknowledgment: time from triggering the transfer of the command string until successful transmission to the HMI
- In the case of an HMI command with synchronous and asynchronous acknowledgment: time from triggering the transfer of the command strings until receipt of the acceptance acknowledgment from the HMI
- For EXTCALL command and execution from external drives: time between the transmission triggering of the command string and the successful sending to the HMI.

10133	START_LOCK_TIMEOUT	EXP	-
s	Monitoring time for channel-specific start disable and WRITE lock	DOUBLE	PowerOn
-			
-	-	2.0	0.5
		3.0	ReadOnly
			S

Description: MD10133 \$MN_START_LOCK_TIMEOUT is evaluated in two situations:

1. If an NC channel is started in AUTO mode (NC Start key) with channel-specific start disable set (not program-specific start disable), then the start is executed if the start disable is reset within the waiting time configured in MD10133 \$MN_START_LOCK_TIMEOUT.

2. If an NC program, for which a Write lock has been set (e.g. by the HMI Editor), is to be processed in EES mode (Execution from External Storage), then the processing is stopped with alarm 14007 after expiry of the waiting time configured by MD10133 \$MN_START_LOCK_TIMEOUT.

10134	MM_NUM_MMC_UNITS			EXP, N01, N02	B3	
-	Possible number of simultaneous HMI communication partners			DWORD	PowerOn	
-						
-	-	6	1	10	2/2	M

Description:

Possible number of simultaneous HMI communication partners with which the NCU can exchange data.

This value affects then number of communication orders that the NCK can manage. The higher the value, the more HMIs that can be simultaneously connected to the NCK without leading to communication problems.

DRAM is made available for this function in the NCU corresponding to the input in the machine data. The inputs for changing the memory areas have to be taken into account.

The unit of MD10134 \$MN_MM_NUM_MMC_UNITS is a "resource unit".

A standard HMI needs 1 resource unit, an HMI100/103 needs 2. OEM variants may need more or less resources.

- If the value is set lower than would be needed for the number of connected HMIs, this is not inevitably problematical. Actions may not function sporadically during multiple, simultaneous, communication-intensive operations (e.g. loading a program): Alarm 5000 is displayed. The operation then has to be repeated.
- If the value is set higher, more dynamic memory is occupied than necessary. The value should be reduced appropriately if the memory is required for other purposes.

References: /FB/, S7, "Memory Configuration"

10136	DISPLAY_MODE_POSITION			N01	-	
-	Display mode for actual position in the Work			DWORD	Reset	
-						
-	-	0	0	1	7/1	M

Description:

Defines how the position and the distance to go are displayed in the Work.

0: Display as in software version 5 and earlier

1: At end of block, the actual value display is in principle the same as the programmed end point, irrespective of where the machine actually is (e.g. as a result of the tool radius compensation). The distance to go is the same as the actual distance to be traversed. This means that the displayed actual position has to be the same as the displayed end position minus the distance to go, irrespective of the actual machine position. If the block end points are changed by chamfers, radii, contour definitions, splines or SAR in comparison to the NC program, then these changes are reflected in the display as if they had been programmed. This does not apply to changes resulting from tool radius compensation or smoothing.

10156	TASK_SLEEP_TIME			EXP	-	
-	Average time transfer per cycle			DWORD	Immediately	
NBUP						
-	-	0	0	10000	7/2	M

Description:

Only relevant to simulation systems

The unit of the machine data is the microsecond.

2.3 NC machine data

In the simulation environment, a machining run designates execution of the tasks Server, IPO, and PREP, which are not interrupted

This machine data now specifies the average time that is allocated to the operating system of the simulation host system per machining run.

As it is not usually possible to allocate times in the microsecond range in the operating system of the simulation host system, the times are calculated over multiple cycles, and then the default time set by the operating system (typically between 10 - 15 milliseconds) is allocated. A number of cycles are therefore run without delay, and there is a correspondingly longer wait later, so that the time set in the MD is allocated as an overall average. The value 0 deactivates the time allocation.

E.g.: If MD10156 \$MN_TASK_SLEEP_TIME is set to the value 50 (microseconds), and the minimum allocated time defined by the operating system is 10 milliseconds (= 10000 microseconds), there will be a delay of 10 milliseconds every 200 cycles (10000/50).

10160	PREP_COM_TASK_CYCLE_RATIO			EXP, N01	ECO	
-	Factor for communication with HMI			DWORD	PowerOn	
-						
-	-	3	1	50	7/1	M

Description: This machine data specifies the division ratio used for activating the communication task in the non-cyclic time level. This allows the time share of preparation in the non-cyclic time level to be increased, which reduces block change times. This slows down external communication (file transfer), especially during program execution (group-by-group reload).

10185	NCK_PCOS_TIME_RATIO			EXP, N01	-	
%	Processing time share NCK			DOUBLE	PowerOn	
-						
-	-	90.0	90.0	95.0	7/2	M

Description: This machine data defines the maximum proportion of CPU time in percent given to the NC kernel in the entire system. The division specified by the user is implemented as far as possible.

When implementing the specification, the system takes into account limiting values for the absolute proportion of CPU time that must not be exceeded or undershot.

Adaptations are made without generating an alarm.

10190	TOOL_CHANGE_TIME			N01	BA	
s	Tool changing time for simulation			DOUBLE	PowerOn	
-						
-	-	0.	-MD_DBLMAX	1.0E+301	7/2	M

Description: This data defines how much time is estimated for a tool change (only relevant for a simulation).

Note:

The time entered here replaces only the times for tool change which do not occur in the simulation on principle, such as waiting times for PLC commands, such as M206. Any traversing commands or similar which the tool change cycle also issues in the simulation are added to the estimated time in addition to the value entered here.

If the value of the MD is to be added to the estimated time as the total time of the tool change, then the following must be programmed at the start of the tool change cycle:

```
IF $MN_SIM_ENVIRONMENT B_AND 'B100' M206 ; see MD22560 $MC_TOOL_CHANGE_M_CODE
RET
ENDIF
```

10192	GEAR_CHANGE_WAIT_TIME			N01	S1	
s	Gear stage change waiting time			DOUBLE	PowerOn	
-						
-	-	10.0	0.0	1.0e5	7/2	M

Description: External events which trigger reorganization, wait for the end of a gear stage change. GEAR_CHANGE_WAIT_TIME now determines the waiting time for the gear stage change. Time unit in seconds.

When this time expires without the gear stage change having been terminated, the NCK reacts with an alarm.

Among others, the following events will cause reorganization:

User ASUB

Mode change

Delete distance-to-go

Axis replacement

Activate user data

10200	INT_INCR_PER_MM			N01	G2, K3	
-	Calculation resolution for linear positions			DOUBLE	PowerOn	
LINK						
-	-	1000.	1.0	1.0e9	7/2	M

Description: This MD defines the number of internal increments per millimeter.

The accuracy of the input of linear positions is limited to the calculation accuracy by rounding the product of the programmed value and the calculation accuracy to an integer.

In order to keep the executed rounding easily understandable it is useful to use powers of 10 for the calculation accuracy.

10210	INT_INCR_PER_DEG			N01	G2, K3, R2	
-	Calculation resolution for angular positions			DOUBLE	PowerOn	
LINK						
-	-	1000.0	1.0	1.0e9	7/2	M

Description: This MD defines the number of internal increments per degree.

The accuracy of the input of angular positions is limited to the calculation accuracy by rounding the product of the programmed value and the calculation accuracy to an integer.

In order to keep the executed rounding easily understandable it is useful to use powers of 10 for the calculation accuracy.

10220	SCALING_USER_DEF_MASK			EXP, N01	G2	
-	Activation of scaling factors			UDWORD	PowerOn	
SCAL						
-	-	0x200	0	0x7FFF	7/2	M

Description: Bit mask for selecting the base values for the data (e.g. machine and setting data) that have a physical unit, they are interpreted in the default units shown below according to the basic system (metric/inch). If other input/output units are to be selected for individual physical units then these are activated with the scale factors associated with this machine data (entered in MD10230 \$MN_SCALING_FACTORS_USER_DEF[n]).

This does not affect the programming of geometry and feed values.

Bit set:

2.3 NC machine data

Data of the assigned physical variable (see list) are scaled to the unit defined by MD10230 \$MN_SCALING_FACTORS_USER_DEF[n].

Bit not set:

Data of the assigned physical variable are scaled to the default unit shown below.

Assigned physical variable	Default units for:	
	MD10240 \$MN_SCALING_SYSTEM_IS_METRIC	
Bit no.	1 = METRIC	0 = INCH
(Stated as hex value)		
0 Linear position	1 mm	1 inch
1 Angular position	1 degree	1 degree
2 Linear velocity	1 mm/min	1 inch/min
3 Angular speed	1 rpm	1 rpm
4 Linear acceleration	1 m/s ²	1 inch/s ²
5 Angular acceleration	1 rev/s ²	1 rev/s ²
6 Linear jerk	1 m/s ³	1 inch/s ³
7 Angular jerk	1 rev/s ³	1 rev/s ³
8 Time	1 s	1 s
9 Position-controller servo gain	1/s	1/s
10 Revolutional feedrate	1 mm/rev	1 mm/rev
11 Compensation value linear pos.	1 mm	1 mm
12 Compensation value angular pos.	1 degree	1 degree
13 Cutting speed	1 m/min	1 feet/min

Example:

SCALING_USER_DEF_MASK = ?H3?; (Bit nos. 0 and 1 as hex values)

The scale factor defined in the associated MD10230 \$MN_SCALING_FACTORS_USER_DEF[n] is activated for linear and angular positions.

If this machine data is changed, a power on is required as otherwise the associated machine data that have physical units would be incorrectly scaled.

Proceed as follows:

- MD changed manually
First start up and then enter the associated machine data with physical units.
- MD changed via machine data file
First start up and then reload the machine data file so that the new physical units are taken into account.

If the machine data are altered, alarm 4070 "Scaling machine data altered" is output.

Application example: Input/output of linear velocities is to be in cm/min:

SCALING_USER_DEF_MASK = 0x4 (bit no. 2 as hex value)

SCALING_FACTORS_USER_DEF[2] = 0.1666666667 (10/60)

[Related to:

MD10230 \$MN_SCALING_FACTORS_USER_DEF[n] (scaling factors of the physical variables)

10230	SCALING_FACTORS_USER_DEF			EXP, N01	G2	
-	Scaling factors of physical variables [0] Linear position 1 mm [1] Angular position 1 degree [2] Linear velocity 1 mm/s [3] Angular speed 1 degree/s [4] Linear acceleration 1 mm/s ² [5] Angular acceleration 1 degree/s ² [6] Linear jerk 1 mm/s ³ [7] Angular jerk 1 degree/s ³ [8] Time 1 s [9] Position controller loop gain 1/s [10] Revolutionary feedrate 1 mm/degree [11] Compensation value linear position 1 mm [12] Compensation value angular position 1 degree [13] Cutting speed 1 mm/s			DOUBLE	PowerOn	
SCAL						
-	15	1.0, 1.0, 1.0, 1.0, 1.0, 1.0, 1.0, 1.0...	1e-9	1.0E+301	7/2	M

Description:

The scaling factor of a physical variable that has a unit other than the default unit setting (set bit in MD10220 \$MN_SCALING_USER_DEF_MASK) is entered in this MD. The factor must refer to the unit used internally for the physical variable in question.

The scaling factor is assigned to the physical variable using the index [0...12]. If this machine data is changed, a startup is required because otherwise the associated machine data that have physical units would be incorrectly scaled.

Proceed as follows:

- MD changed manually
First start up and then enter the associated machine data with physical units.
- MD changed via machine data file
First start up and then reload the machine data file so that the new physical units are taken into account.

If the machine data are altered, alarm 4070 "Scaling machine data altered" is output.

Application example(s):

Input/output of angular speeds is to be in new degree/min: MD10220
 \$MN_SCALING_USER_DEF_MASK = 'H8'; (bit no. 3 as hex value) MD10230
 \$MN_SCALING_FACTORS_USER_DEF[3] = 0.01851852; (400/360/60)
 [3]: Index for angular speed.

Related to:

MD10220 \$MN_SCALING_USER_DEF_MASK (activation of scaling factors).

10240	SCALING_SYSTEM_IS_METRIC			N01	G2, K3, A3, S1	
-	Basic system metric			BOOLEAN	PowerOn	
SCAL						
-	-	TRUE	FALSE	TRUE	7/2	M

Description:

The MD defines the basic system used by the control for scaling length-dependent physical variables for data input/output.

All corresponding data are stored internally in the basic units of 1 mm, 1 degree and 1 sec.

In the case of access from the interpreter (part program and download), from the operator panel (variable service) or through external communication, scaling takes place in the following units:

2.3 NC machine data

MD10240 \$MN_SCALING_SYSTEM_IS_METRIC = 1: scaled in:

mm, mm/min, m/s2, m/s3, mm/rev.

MD10240 \$MN_SCALING_SYSTEM_IS_METRIC = 0: scaled in:

inch, inch/min, inch/s2, inch/s3, inch/rev.

The selection of the basic system also defines the interpretation of the programmed F value for linear axes:

	metric	inch
G94	mm/min	inch/min
G95	mm/rev.	inch/rev.

If this machine data is changed, a startup is required because otherwise the associated machine data that have physical units would be incorrectly scaled.

Proceed as follows:

- MD changed manually

First start up and then enter the associated machine data with physical units.

- MD changed via machine data file

First start up and then reload the machine data file so that the new physical units are taken into account.

If the machine data are altered, alarm 4070 "Scaling machine data altered" is output.

Application example(s):

Setup is in the metric system and then changed over to the inch system.

Special cases:

10260	CONVERT_SCALING_SYSTEM			EXP	-, G2, B3, K3, N3	
-	Enable basic system conversion			BOOLEAN	PowerOn	
LINK						
-	-	FALSE	FALSE	TRUE	1/1	M

Description:

Determines the handling of MD10240 \$MN_SCALING_SYSTEM_IS_METRIC.

0: Inch/metric behavior conforms to SW1-SW4

1: Inch/metric behavior from SW5

Inch/metric functionality of SW5:

1. Switch over the systems of units with HMI softkey
2. New G codes G700/G710
3. Data backup with system of unit recognition INCH/METRIC
4. Automatic data conversion on change of system of units

- All zero point offsets
- Compensation data (EEC, QEC)
- Tool offsets
- etc.

The change from MD10260 \$MN_CONVERT_SCALING_SYSTEM leads to alarm 4070!

This alarm is designed to indicate that data which remain active after a POWERON are not subjected to automatic conversion from SW1-SW4 and SW5 formats.

10270	POS_TAB_SCALING_SYSTEM			N01, N09	T1, N3, G2	
-	System of units of position tables			BYTE	Reset	
-						
-	-	0	0	1	7/2	M

10280	PROG_FUNCTION_MASK			EXP, N01	K1	
-	Bit mask to parameterize various part program commands			UDWORD	PowerOn	
-						
-	-	0x0	0	0x1F	7/2	M

Description:

Bit mask to parameterize various part program commands

Bit Hexadec. Meaning with bit set

Value

0: 0x1 Comparison commands ">" and "<" are processed as with SINUMERIK 840D:

Part program data of the type REAL are mapped internally in the IEEE 64 bit format. This mode maps decimal numbers inaccurately if this format's 52-bit wide mantissa is inadequate to map the number in binary notation. To solve this problem, all comparison commands (==, <>, >=, <=, > and <) are checked for relative equality of 1E-12.

This procedure is deactivated for greater than (>) and less than (<) comparisons by setting bit 0. (Compatibility setting for SINUMERIK 840D)

1: 0x2 Programming the channel names from machine data MD20000 \$MC_CHAN_NAME

By setting bit 1, the channel name stored in machine data MD20000 \$MC_CHAN_NAME can be programmed in the part program. The channel name can thus also be programmed instead of a numerical value for the channel number in programming coordination commands such as (START(), INIT(), WAIT() etc.)

2: 0x4 Reserved

3: 0x8 Convert illegal ASCII characters into blanks

By setting bit3, the previous behavior is activated when interpreting a part program block. This means that all invalid ASCII characters in a part program block are handled internally as blank.

4: 0x10 The wait time G4 F<wait time> is rounded off as a multiple integer of an IPO cycle.

2.3 NC machine data

This means that a G4 F0.001 only takes one cycle, for an IPO cycle of 1 msec.

10284	DISPLAY_FUNCTION_MASK			EXP, N01	-	
-	Behavior of various display variables			UDWORD	PowerOn	
-						
-	-	0x0	0	0x7FFFFFFF	7/2	M

Description:

Bit mask for parameterizing various display variables:

BitNo. Hexadec. Meaning with bit set
value

Bit0: 0x1

Parameters are assigned to the OPI variable lastBlockNoStr in the SPARP and SPARPP blocks.

Bit1: 0x2

Concerns the OPI variable cmdSpeed in the SPARPP block. If the bit is set, the variable returns the programmed speed even if the spindle is at a standstill or in another mode (positioning mode, axis mode).

Bit2 0x4

Concerns the OPI variable cmdSpeed in the SPARPP block. (reserved for constant cutting speed)

Bit8: 0x100

Servotrace manages larger numerical values internally. Overruns in data format are avoided. The accuracy may be reduced with large numerical values.

10285	TASK_TIME_AVERAGE_CONFIG			EXP, N01	-	
-	Period for task runtime mean value generation			DOUBLE	PowerOn	
-						
-	-	1.0	0	86400	7/2	M

Description:

Period in seconds for which the respective mean value of the task runtimes is generated.

For the value 0, the current actual value is provided as mean value.

This mean value can be read via the OPI variable aveCycleTimeNet.

10290	CC_TDA_PARAM_UNIT			N09	G2	
-	Physical units of tool data for compile cycles			DWORD	PowerOn	
-

2.3 NC machine data

7 : Linear jerk [m/s³ ; inch/s³]

8 : Angular jerk [rev/s³ ; rev/s³]

9 : Feedrate per revolution [mm/rev; inch/rev]

Only available if Bit 2 (0x4) is set in MD18080 \$MN_MM_TOOL_MANAGEMENT_MASK.

Related to:

MD18206 \$MN_MM_NUM_CCS_TOA_PARAM

10300	FASTIO_ANA_NUM_INPUTS			N10	A4, TE1	
-	Number of active analog NC inputs			BYTE	PowerOn	
-						
-	-	0	0	8	7/2	M

Description:

This machine data defines the number of usable analog NC inputs on the control.

Only these analog NC inputs can be addressed by the NC part program or assigned by NC functions.

If more analog NC inputs are defined with the machine data than are available in the hardware of the control, the binary analog actual value is set to zero in the control for the inputs that do not exist in the hardware. The NCK value can be altered by the PLC.

Note:

CPU computing time on the interpolation level is required for processing the digital and analog NC I/Os. The number of active NC I/Os should therefore be limited to the demands of the machine so that the interpolation cycle time is not unnecessarily loaded.

10310	FASTIO_ANA_NUM_OUTPUTS				N10	A4	
-	Number of active analog NC outputs				BYTE	PowerOn	
-							
-	-	0	0	8	7/2	M	

Description:

This machine data defines the number of usable analog NC outputs on the control.

Only these analog NC outputs can be addressed by the NC part program or assigned by NC functions.

If more analog NC outputs are defined with the machine data than are available in the hardware of the control, no alarm is triggered. The analog values specified by the part program can be read by the PLC.

Note:

CPU computing time on the interpolation level is required for processing the digital and analog NC I/Os. The number of active NC I/Os should therefore be limited to the demands of the machine so that the interpolation cycle time is not unnecessarily loaded.

10320	FASTIO_ANA_INPUT_WEIGHT			N10	A4	
-	Weighting factor for analog NC inputs			DWORD	PowerOn	
-						
-	8	10000, 10000, 10000, 10000, 10000, 10000, 10000, 10000	1	10000000	7/2	M

Description:

A weighting factor can be defined with this MD for each analog NC input [n] to enable adaptation to the various analog-to-digital converters (depending on the I/O module).

The value to be entered in this machine data is the value that is to be read in the part program with the command x = \$A_INA[n] if the associated analog input [n] is set to the maximum value or the value +32767 is defined for this input via the PLC interface.

The value read from the analog-to-digital converter or the PLC interface is multiplied by the factor (FASTIO_ANA_INPUT_WEIGHT / 32767) before it can be read in the part program with the system variable \$A_INA[n].

Use of the weighting factor for "Analog NC inputs without hardware": with a weighting factor of 32767, the values defined by the part program and the PLC are numerically identical (1:1 communication between part program and PLC). This is advantageous when the analog NC inputs/outputs are used purely as PLC inputs/outputs without analog hardware.

Note:

The comparator threshold values SD41600 \$SN_COMPAR_THRESHOLD_1 and SD41601 \$SN_COMPAR_THRESHOLD_2 are also normalized to MD10320 \$MN_FASTIO_ANA_INPUT_WEIGHT corresponding to their assignment to an analog input.

The CC access to analog values is not affected by FASTIO_ANA_INPUT_WEIGHT.

Related to:

NC/PLC interface signal DB10, DBB148 - 163 (PLC setting value for analog NC inputs)

10330	FASTIO_ANA_OUTPUT_WEIGHT			N10	A4	
-	Weighting factor for analog NC outputs			DWORD	PowerOn	
-						
-	8	10000, 10000, 10000, 10000, 10000, 10000, 10000, 10000	1	10000000	7/2	M

Description: A weighting factor can be defined with this MD for each analog NC output [n] to enable adaptation to the various digital-to-analog converters (depending on the I/O module used).

[hw] = Index (0 to 7) for addressing the external analog outputs

The value x to be entered in this machine data is the value that is to effect the maximum set value of the associated analog output [n] when programming \$A_OUTA[n] = x in the part program or is to generate the value +32767 in the PLC interface for this output.

Use of the weighting factor for "Analog NC outputs without hardware": With a weighting factor of 32767, the values defined by the part program and the PLC are numerically identical (1:1 communication between part program and PLC). This is advantageous when the analog NC outputs are used purely as PLC outputs without analog hardware.

2.3 NC machine data

NC/PLC interface signal DB10 DBB123,125,127,129 (PLC values for external digital inputs 9-40)

NC/PLC interface signal DB10, DBB60, DBB186 (Actual value for digital NC inputs)

10360	FASTIO_DIG_NUM_OUTPUTS			N10	A4, TE8	
-	Number of active digital NC output bytes			BYTE	PowerOn	
-						
-	-	0	0	5	7/2	M

Description:

The number of bytes for digital NC outputs that can be used on the control are defined in this machine data.

These digital NC outputs can be set directly by the part program. The PLC is able to

- set the digital outputs to "0" in a defined way with NC/PLC interface signal DB10, DBB4, DBB130 (Disable the digital NC outputs).
- alter the NCK value with NC/PLC interface signal DB10, DBB5, DBB131 (Overwrite mask for digital NC outputs).
- specify a PLC value with NC/PLC interface signal DB10, DBB7, DBB133 (Setting mask for digital NC outputs).

If more digital NC outputs are defined in the machine data than are available in the control hardware, no alarm is triggered. The signal states specified by the part program can be read by the PLC.

Special cases:

Digital NC outputs 5 to 8 can be processed only by the PLC (no hardware outputs).

NC/PLC interface signal DB10, DBB4, DBB130 (Disable the digital NC outputs)

NC/PLC interface signal DB10, DBB5, DBB131 (Overwrite mask for digital NC outputs)

NC/PLC interface signal DB10, DBB6, DBB132 (PLC setting value for digital NC outputs)

NC/PLC interface signal DB10, DBB7, DBB133 (Setting mask for digital NC outputs)

NC/PLC interface signal DB10, DBB64, DBB190 (Setpoint for digital NC outputs)

10361	FASTIO_DIG_SHORT_CIRCUIT			N10	A4	
-	Short circuit of digital inputs and outputs			UDWORD	PowerOn	
-						
-	10	0, 0, 0, 0, 0, 0, 0, 0...	0	0x7FFFFFFF	7/2	M

Description:

Defined short circuits between digital output and input signals of the high-speed NC I/Os are realized by linking the signals read in from the high-speed NC I/Os or the PLC interface to defined output signals.

The output signals always remain unchanged by the link, the inputs that have to be taken into account internally arise from the read inputs and the link. If a plurality of output bits are specified for one input bit in overwrite mode, the last defined assignment in the list determines the result.

The definition of non-existent or non-activated inputs/outputs is ignored without an alarm.

Bits 0-7: Number of the input byte to be written (1 - 5)

Bits 8-15: Bit number within the input byte (1 - 8)

Link:

The type of link is selected by adding a hexadecimal number to the input bit number:

00 Overwrite input identically to output

A0 Input is AND-gated to the read input with the status of the stated output

B0 Input is OR-gated to the read input with the status of the stated output

Bits 16-23: Number of the output byte to be used (1 - 5)

Bits 24-31: Bit number within the output byte (1 - 8)

Example:

MD10361 \$MN_FASTIO_DIG_SHORT_CIRCUIT[0] = 0x04010302
 Input: 3rd bit of the 2nd byte
 Output: 4th bit of the 1st byte (= 4th onboard NCU output)
 The input status is overwritten by the specified output
 MD10361 \$MN_FASTIO_DIG_SHORT_CIRCUIT[1] = 0x0705A201
 Input: 2nd bit of the 1st byte (= 2nd onboard NCU input)
 Output: 7th bit of the 5th byte
 The input status is AND-gated with the specified output
 MD10361 \$MN_FASTIO_DIG_SHORT_CIRCUIT[2] = 0x0103B502
 Input: 5th bit of the 2nd byte
 Output: 1st bit of the 3rd byte
 The input status is OR-gated with the specified output

-						
-	-	0	0	16383	7/2	M

Description: Starting from this address, the PLC hardware must configure a number of bytes in MD10394 \$MN_PLCIO_NUM_BYTES_IN for direct use by the NC. These bytes are not transmitted by the PLC user program, but directly via an interrupt of the PLC operating system. The access delay is less than 0.5 ms. The bytes can be read by the part program and from synchronized actions with the system variables:
\$A_PBB_IN,
\$A_PBW_IN,
\$A_PBD_IN,
\$A_PBR_IN
.
Notice:
The machine data MD10394 \$MN_PLCIO_NUM_BYTES_IN and MD10395 \$MN_PLCIO_LOGIC_ADDRESS_IN must be consistent with the PLC-side configuration.
Related to:
MD10394 \$MN_PLCIO_NUM_BYTES_IN

2.3 NC machine data

10396	PLCIO_NUM_BYTES_OUT			N10	A4	
-	Number of directly writable output bytes of the PLC I/Os			BYTE	PowerOn	
-						
-	-	0	0	32	7/2	M

Description:

The number of PLC I/O output bytes that can be written directly by the NC.

These bytes are not transmitted by the PLC user program but via an interrupt of the PLC operating system.

The access delay is less than 0.5 ms.

The bytes can be written by the part program and from synchronized actions with the system variables:

\$A_PBB_OUT,

\$A_PBW_OUT,

\$A_PBD_OUT,

\$A_PBR_OUT

on the NC side.

Attention:

The machine data MD10396 \$MN_PLCIO_NUM_BYTES_OUT and MD10397

\$MN_PLCIO_LOGIC_ADDRESS_OUT must be consistent with the configuration by the PLC, otherwise other PLC output signals will be overwritten.

10397	PLCIO_LOGIC_ADDRESS_OUT			N10	A4	
-	Start addr. of the directly writable output bytes of PLC I/O			DWORD	PowerOn	
-						
-	-	0	0	16383	7/2	M

Description:

Starting from this address, the PLC hardware must configure a number of MD10396 \$MN_PLCIO_NUM_BYTES_OUT for direct use by the NC.

These bytes are not transmitted by the PLC user program, but directly via an interrupt of the PLC operating system.

The access delay is less than 0.5 ms.

The bytes can be written by the part program and from synchronized actions with the system variables:

\$A_PBB_OUT,

\$A_PBW_OUT,

\$A_PBD_OUT,

\$A_PBR_OUT

.

Notice:

The machine data MD10396 \$MN_PLCIO_NUM_BYTES_OUT and MD10397

\$MN_PLCIO_LOGIC_ADDRESS_OUT must be consistent with the PLC-side configuration.

Related to:

MD10396 \$MN_PLCIO_NUM_BYTES_OUT

10398	PLCIO_IN_UPDATE_TIME			N10	A4	
s	Update time for PLCIO input cycle			DOUBLE	PowerOn	
-						
-	-	0.0	0	10000	7/2	M

Description:

Specification of the time span during which the data of the PLC I/Os directly readable via \$A_PBx_IN system variables are updated.

This time span is rounded up internally to the next-higher multiple of the time predefined by the IPO cycle.

10399	PLCIO_TYPE_REPRESENTATION			N10	A4	
-	Little/Big Endian for PLCIO			BYTE	PowerOn	
-						
-	-	0	0	1	7/2	M

Description: Little/big-Endian format representation of the \$A_PBx_OUT, \$A_PBx_IN system variable for PLC I/Os directly controllable by NCK.
Value = 0 ; the system variable is represented in the little-Endian format
Value = 1 ; the system variable is represented in the big-Endian format
As a rule, the PLC I/Os must always be controlled in the big-Endian format (value = 1). For compatibility reasons, however, the default setting is the little-Endian format (value = 0).

10400	CC_VDI_IN_DATA			EXP, N02	OEM	
-	Number of input bytes for compile cycles			DWORD	PowerOn	
-						
-	-	0	0	1024	7/1	M

Description: The compile cycle user can freely define data within a data block on the PLC user interface. As the user, he determines the size of the interface from PLC to NCK. This machine data describes the length of the area on the VDI interface in bytes which defines the NCK input interface. The sum of this and MD10410 \$MN_CC_VDI_OUT_DATA must not exceed 400 for software version 1.

10410	CC_VDI_OUT_DATA			EXP, N02	OEM	
-	Number of output bytes for compile cycles			DWORD	PowerOn	
-						
-	-	0	0	1024	7/1	M

Description: The compile cycle user can freely define data within a data block on the PLC user interface. As the user, he determines the size of the interface from PLC to NCK. This machine data describes the length of the area on the VDI interface in bytes which defines the NCK output interface. The sum of this and MD10400 \$MN_CC_VDI_IN_DATA must not exceed 400.

10420	CC_ASSIGN_FASTOUT_MASK			EXP, N10	OEM	
-	Reservation of external outputs for compile cycles			UDWORD	PowerOn	
-						
-	-	0	0	0x7FFFFFFF	7/2	M

Description: Reservation of high-speed hardware outputs for CC applications
Bit 0(LSB)-14: Mask of the digital output bytes reserved for the CC application
Bits 16-30: Mask of the analog outputs reserved for the CC application
The hardware outputs reserved here are included in the multiple assignment monitoring routine when the system is powered up. We recommend that you register all the hardware outputs used by CC applications here.
Bit 15: Suppresses power-up alarm 4275 (multiple assignment of digital output)
Bit 31: Suppresses power-up alarm 4275 (multiple assignment of analog output)

10430	CC_HW_DEBUG_MASK			EXP	OEM	
-	Hardware debug mask for compile cycles			UDWORD	PowerOn	
NBUP, NDLD						
-	-	0	0	0x7FFFFFFF	7/1	M

Description: Setting of special responses to peripheral HW interfaces for NCK debug

2.3 NC machine data

For practical debugging of NCK software, among other things, the response of peripheral units to the loss of the NCK sign of life must be suppressed when the NCK software has run to a breakpoint.

Bit 0 (LSB)–3:

For practical debugging of NCK software, among other things, the response of peripheral units to the loss of the NCK sign of life must be suppressed when the NCK software has run to a breakpoint.

Meaning of set bits:

Bit 0:

Drive modules ignore the loss of the NCK sign of life

Bit 1:

Terminal blocks ignore the loss of the NCK sign of life

Bit 3:

PLC ignores the loss of the NCK sign of life

Bit 4:

Recording of internal and external control commands. Recording the control sequences and storing them in a file in the passive file system. One can trace the exact sequence between the incoming hardware signals of the PLC interface and the internal sequences with the aid of the recording file.

Bit 5:

Servotrace: Enable physical addresses without access control

Bit10:

Test for measuring function. If this bit is set, one can use the GUD variables CHAN INT MEA_TASK and CHAN INT MEA_COUNTER to transfer the inverse transformation of the measured values into cyclical and non-cyclical tasks.

Bit11:

No EMERGENCY STOP alarm on loss of PLC sign of life. If the PLC sign of life is not obtained within the time defined in MD10100 \$MN_PLC_CYCLIC_TIMEOUT, an alarm is not issued, merely the axis releases are withdrawn. (Application case: debugging the PLC user program)

Bit15:

Reserved for gantry setup help.

10450	SW_CAM_ASSIGN_TAB			N09	N3	
-	Assignment of software cams to machine axes			BYTE	PowerOn	
-						
-	32	0, 0, 0, 0, 0, 0, 0, 0...	0	31	7/2	M

Description:

This machine data allows one machine axis to be assigned to each of the 16 possible cam pairs (each is comprised of one minus and one plus cam).

If a "0" is entered, the corresponding cam is not processed.

The cam signal output is activated via the axial NC/PLC interface signal DB31, ... DBX2.0 (Cam activation)

Index [n] of the machine data addresses the cam pair: n = 0, 1, ... , 15 correspond to cam pairs 1, 2, ... , 16

Related to:

NC/PLC interface signal DB31, ... DBX2.0 (Cam activation)

Example:

Cam pair 1 is to be assigned to machine axis 3, and cam pair 3 to machine axis 4. Cam pair 2 is not to be assigned to an axis.

MD10450 \$MN_SW_CAM_ASSIGN_TAB[0]= 3

MD10450 \$MN_SW_CAM_ASSIGN_TAB[1]= 0

MD10450 \$MN_SW_CAM_ASSIGN_TAB[2]= 4

10460	SW_CAM_MINUS_LEAD_TIME			N09	N3	
s	Lead or delay time at minus cams 1-16			DOUBLE	PowerOn	
-						
-	32	0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0...	-MD_DBLMAX	1.0E+301	7/2	M

Description: A lead or delay time can be assigned in this machine data to each minus cam 1-16 to compensate for delay times.

The switching edge of the associated cam signal is advanced or delayed by the time value entered.

Positive value: --> Lead time

Negative value: --> Delay time

Serves to compensate for the constant proportion of the internal delay time between actual value acquisition and signal output.

Index [n] of the machine data addresses the cam pair:
n = 0, 1, ... , 15 correspond to cam pairs 1, 2, ... , 16

This machine data is added to the setting data SD41520 \$SN_SW_CAM_MINUS_TIME_TAB_1[n] and SD41522 \$SN_SW_CAM_MINUS_TIME_TAB_2[n].

Related to:

SD41520 \$SN_SW_CAM_MINUS_TIME_TAB_1[n] (lead or delay time on minus cams 1 - 8)

SD41522 \$SN_SW_CAM_MINUS_TIME_TAB_2[n] (lead or delay time on minus cams 9 - 16)

10461	SW_CAM_PLUS_LEAD_TIME			N09	N3	
s	Lead or delay time at plus cams 1-16			DOUBLE	PowerOn	
-						
-	32	0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0...	-MD_DBLMAX	1.0E+301	7/2	M

Description: A lead or delay time can be assigned in this machine data to each plus cam 1-16 to compensate for delay times.

The switching edge of the associated cam signal is advanced or delayed by the time value entered.

Positive value: --> Lead time

Negative value: --> Delay time

Serves to compensate for the constant proportion of the internal delay time between actual value acquisition and signal output.

Index [n] of the machine data addresses the cam pair:
n = 0, 1, ... , 15 correspond to cam pairs 1, 2, ... , 16

This machine data is added to the setting data SD41521 \$SN_SW_CAM_PLUS_TIME_TAB_1[n] and SD41523 \$SN_SW_CAM_PLUS_TIME_TAB_2[n].

Related to:

SD41521 \$SN_SW_CAM_PLUS_TIME_TAB_1[n] (lead or delay time on plus cams 1 - 8)

SD41523 \$SN_SW_CAM_PLUS_TIME_TAB_2[n] (lead or delay time on plus cams 9 - 16)

10470	SW_CAM_ASSIGN_FASTOUT_1			N09	N3	
-	Hardware assignment for output of cams 1-8 to NC I/Os			UDWORD	PowerOn	
-						
-	-	0	0	0x7FFFFFFF	7/2	M

Description: The cam signal status can be output to the NC I/Os as well as to the PLC.

The hardware assignment of the minus and plus cam signals to the digital output bytes used for the NC I/Os is made in this machine data for cam pairs 1 - 8.

The assigned output signals can also be inverted with this machine data.

2.3 NC machine data

The MD is coded as follows:

Bits 0-7: No. of 1st HW byte used with digital outputs
 Bits 8-15: No. of 2nd HW byte used with digital outputs
 Bits 16-23: Inversion mask for writing 1st HW byte used
 Bits 24-31: Inversion mask for writing 2nd HW byte used
 Bit=0: Do not invert
 Bit=1: Invert

If both HW bytes are specified, the 1st byte contains the minus cam signals and the 2nd byte the plus cam signals.

If the 2nd byte is not specified (= "0"), then the 8 cams are output as an AND operation of the minus and plus cam signals via the 1st HW byte using the 1st inversion mask.

The status of the non-inverted output signal for linear axes and for rotary axes with "plus cam - minus cam < 180 degrees" is:

"1" between minus and plus cams
 "0" outside this range

The status of the non-inverted output signal for rotary axes with "plus cam - minus cam >= 180 degrees" is:

"0" between minus and plus cams
 "1" outside this range

The following must be specified as the byte address for the digital outputs:

1: for on-board byte
 2 - 5: for external bytes

10471	SW_CAM_ASSIGN_FASTOUT_2			N09	N3	
-	Hardware assignment for output of cams 9-16 to NC I/Os			UDWORD	PowerOn	
-						
-	-	0	0	0x7FFFFFFF	7/2	M

Description:

The cam signal status can be output to the NC I/Os as well as to the PLC.

The hardware assignment of the minus and plus cam signals to the digital output bytes used for the NC I/Os can be made in this machine data for cam pairs 9 - 16.

The assigned output signals can also be inverted with this machine data.

The MD is coded as follows:

Bits 0-7: No. of 1st HW byte used with digital outputs
 Bits 8-15: No. of 2nd HW byte used with digital outputs
 Bits 16-23: Inversion mask for writing 1st HW byte used
 Bits 24-31: Inversion mask for writing 2nd HW byte used
 Bit=0: Do not invert
 Bit=1: Invert

If both HW bytes are specified, the 1st byte contains the minus cam signals and the 2nd byte the plus cam signals.

If the 2nd byte is not specified (= "0"), then the 8 cams are output as an AND operation of the minus and plus cam signals via the 1st HW byte using the 1st inversion mask.

The status of the non-inverted output signal for linear axes and for rotary axes with "plus cam - minus cam < 180 degrees" is:

"1" between minus and plus cams
 "0" outside this range

The status of the non-inverted output signal for rotary axes with "plus cam - minus cam >= 180 degrees" is:

"0" between minus and plus cams

"1" outside this range

The following must be specified as the byte address for the digital outputs:

1: for on-board byte

2 - 5: for external bytes

10472	SW_CAM_ASSIGN_FASTOUT_3			N09	N3	
-	Hardware assignment for output of cams 17-24 to NC I/Os			UDWORD	PowerOn	
-						
-	-	0	0	0x7FFFFFFF	7/2	M

Description:

The cam signal status can be output to the NC I/Os as well as to the PLC.

The hardware assignment of the minus and plus cam signals to the digital output bytes of the NC I/Os used can be made in this machine data for cam pairs 17 - 24.

The assigned output signals can also be inverted with this machine data.

The MD is coded as follows:

Bits 0-7: Number of 1st HW byte used with digital outputs

Bits 8-15: Number of 2nd HW byte used with digital outputs

Bits 16-23: Inversion mask for writing 1st HW byte used

Bits 24-31: Inversion mask for writing 2nd HW byte used

Bit=0: Do not invert

Bit=1: Invert

If both HW bytes are specified, the 1st byte contains the minus cam signals and the 2nd byte the plus cam signals.

If the 2nd byte is not specified (= "0"), then the 8 cams are output as an AND operation of the minus and plus cam signals via the 1st HW byte using the 1st inversion mask.

The status of the non-inverted output signal for linear axes and for rotary axes with "plus cam - minus cam < 180 degrees" is:

"1" between minus and plus cams

"0" outside this range

The status of the non-inverted output signal for rotary axes with "plus cam - minus cam >= 180 degrees" is:

"0" between minus and plus cams

"1" outside this range

The following must be specified as the byte address for the digital outputs:

1: for on-board byte

2 - 5: for external bytes

10473	SW_CAM_ASSIGN_FASTOUT_4			N09	N3	
-	Hardware assignment for output of cams 25-32 to NC I/Os			UDWORD	PowerOn	
-						
-	-	0	0	0x7FFFFFFF	7/2	M

Description:

The cam signal status can be output to the NC I/Os as well as to the PLC

The hardware assignment of the minus and plus cam signals to the digital output bytes of the NC I/Os used can be made in this machine data for cam pairs 25 - 32.

The assigned output signals can also be inverted with this machine data.

The MD is coded as follows:

Bits 0-7: Number of 1st HW byte used with digital outputs

Bits 8-15: Number of 2nd HW byte used with digital outputs

Bits 16-23: Inversion mask for writing 1st HW byte used

Bits 24-31: Inversion mask for writing 2nd HW byte used

2.3 NC machine data

Bit=0: Do not invert

Bit=1: Invert

If both HW bytes are specified, the 1st byte contains the minus cam signals and the 2nd byte the plus cam signals.

If the 2nd byte is not specified (= "0"), then the 8 cams are output as an AND operation of the minus and plus cam signals via the 1st HW byte using the 1st inversion mask.

The status of the non-inverted output signal for linear axes and for rotary axes with "plus cam - minus cam < 180 degrees" is:

"1" between minus and plus cams

"0" outside this range

The status of the non-inverted output signal for rotary axes with "plus cam - minus cam >= 180 degrees" is:

"0" between minus and plus cams

"1" outside this range

The following must be specified as the byte address for the digital outputs:

1: for on-board byte

2 - 5: for external bytes

10480	SW_CAM_TIMER_FASTOUT_MASK			N09	N3	
-	Mask for output of cam signals via timer interr. to NCU			UDWORD	PowerOn	
-						
-	-	0	0	0x7FFFFFFF	7/2	M

Description:

A timer-controlled output to the 4 on-board outputs of the NC I/Os can be selected in this machine data for 4 cam pairs.

In this case, the minus and plus signals of a cam pair are "EXCLUSIVE OR'd" for output as one signal.

Meaning for set bit:

Associated cam (minus and plus cam signals "EXCLUSIVE OR'd") is output via a timer interrupt at one of the 4 on-board outputs of the NCU.

The on-board outputs are assigned in order of increasing machine axis numbers (with assigned cam pairs).

Example:

Machine axis 3 = cam pair 1 --> on-board output 3

Machine axis 1 = cam pair 2 --> on-board output 1

Machine axis 7 = cam pair 3 --> on-board output 4

Machine axis 2 = cam pair 4 --> on-board output 2

If a plurality of cam pairs are set for one machine axis, then this axis is assigned in ascending order of the cam pairs.

Example:

Machine axis 3 = cam pair 1 --> on-board output 2

Machine axis 3 = cam pair 2 --> on-board output 3

Machine axis 7 = cam pair 3 --> on-board output 4

Machine axis 2 = cam pair 4 --> on-board output 1

This function works independently of the assignment set in MD10470 \$MN_SW_CAM_ASSIGN_FASTOUT_1 or MD10471 \$MN_SW_CAM_ASSIGN_FASTOUT_2.

Note:

The on-board byte must not be used more than once.

If there is more than one signal change in the IPO cycle for the cam pairs specified in the MD, then the cam pair with the lowest number determines the instant of output. The other signals change at the same time.

10485	SW_CAM_MODE			N09	N3	
-	Behavior of SW cams			UDWORD	PowerOn	
-						
-	-	0	0	0x7FFFFFFF	7/2	M

Description:

Meaning of the individual bits:

Bit 0 (LSB) = 0:

If more than 1 signal change per interpolation cycle is due for the cams specified in MD10480 \$MN_SW_CAM_TIMER_FASTOUT_MASK, the cam having the lowest number will determine the output instant. The other signals change at the same instant. That is, a maximum of one interrupt-controlled output is effected per interpolation cycle.

Bit 0 (LSB) = 1:

Each cam specified in MD10480 \$MN_SW_CAM_TIMER_FASTOUT_MASK will be output precisely at the time of the interpolation cycle. There is no output priority of the cams. A maximum of 8 interrupt-controlled outputs can be performed per interpolation cycle.

Bit 1 = 0:

Inversion of signal behavior from plus cam, where plus cam - minus cam $\geq$ 180 degr.

Bit 1 = 1:

No inversion of signal behavior from plus cam, where plus cam - minus cam $\geq$ 180 degr.

Signal behavior on-board output:

Overtravelling:

Minus cam plus cam

Traversing direction:

positive 0->1 1->0

negative 1->0 0->1

Bit 2 = 0:

No path-time cam

Bit 2 = 1:

Path-time cam for cams where minus position = plus position. The lead/delay time applied is independent of:

- velocity of the axis
- position of the axis
- reversal of traversing direction

The cam is only activated on overtravelling of the cam position. A lead/delay time applied to the minus cam is active and leads to a shift of the whole cam.

Bit 3 = 0:

No alignment signal in case of measurement area selection.

Bit 3 = 1:

Output of an alignment signal for measurement area selection (FM only). On-board output 8 is used permanently.

On-board output 8 = 1: Measurement possible (active range enabled)

On-board output 8 = 0: Measurement not possible

Bit 4 = 0:

and following free

10490	SW_CAM_COMP_NCK_JITTER			N09	-	
s	Cam jitter compensation			DOUBLE	NEW CONF	
-						
-	-	0	0.0	0.0001	7/2	M

2.3 NC machine data

Description: The compensation value reduces system-related time inaccuracies during output of highly precise cam signals. The default time encumbers the cyclic time level of the control, and should therefore be selected as short as possible. We recommend that you return a cam signal to a measuring input of the control and increase the compensation value until the scatter of the measured positions cannot be reduced any further.

Currently only active when MD10485 \$MN_SW_CAM_MODE Bit0 = 0.

10500	DPIO_LOGIC_ADDRESS_IN			N10	A4	
-	Logical slot address of the PROFIBUS/PROFINET I/Os			DWORD	PowerOn

2.3 NC machine data

10530	COMPAR_ASSIGN_ANA_INPUT_1	N10	A4
-	Hardware assignment of analog inputs for comparator byte 1	BYTE	PowerOn
-			
-	8	0, 0, 0, 0, 0, 0, 0, 0	- - 7/2 M

Description:

This MD assigns analog inputs 1 to 8 to a bit number of comparator byte 1. This input bit of the comparator is set to "1" if the comparison between the applied analog value and the associated threshold value (SD41600 \$SN_COMPAR_THRESHOLD_1 fulfills the condition parameterized in (MD10540 \$MN_COMPAR_TYPE_1).

An analog input can be assigned to a plurality of comparator input bits.

The following generally applies to comparator byte 1:

COMPAR_ASSIGN_ANA_INPUT_1 [b] = n

with index: b = number of comparator input bit (0 to 7)

n = number of analog input (1 to 8)

Example:

```
COMPAR_ASSIGN_ANA_INPUT_1[0] = 1
COMPAR_ASSIGN_ANA_INPUT_1[1] = 2
COMPAR_ASSIGN_ANA_INPUT_1[2] = 1
COMPAR_ASSIGN_ANA_INPUT_1[3] = 3
COMPAR_ASSIGN_ANA_INPUT_1[4] = 3
COMPAR_ASSIGN_ANA_INPUT_1[5] = 1
COMPAR_ASSIGN_ANA_INPUT_1[6] = 1
COMPAR_ASSIGN_ANA_INPUT_1[7] = 1
```

Analog input 1 affects input bits 0, 2, 5, 6 and 7 of comparator byte 1

Analog input 2 affects input bit 1 of comparator byte 1

Analog input 3 affects input bits 3 and 4 of comparator byte 1

10531	COMPAR_ASSIGN_ANA_INPUT_2	N10	A4
-	Hardware assignment of analog inputs for comparator byte 2	BYTE	PowerOn
-			
-	8	0, 0, 0, 0, 0, 0, 0, 0	- - 7/2 M

Description:

This MD assigns analog inputs 1 to 8 to a bit number of comparator byte 2. This input bit of the comparator is set to "1" if the comparison between the applied analog value and the associated threshold value (SD41601 \$SN_COMPAR_THRESHOLD_2 fulfills the condition parameterized in (MD10541 \$MN_COMPAR_TYPE_2).

An analog input can be assigned to a plurality of comparator input bits.

The following generally applies to comparator byte 2:

COMPAR_ASSIGN_ANA_INPUT_2 [b] = n

with index: b = number of comparator input bit (0 to 7)

n = number of analog input (1 to 8)

Example:

```
COMPAR_ASSIGN_ANA_INPUT_2[0] = 1
COMPAR_ASSIGN_ANA_INPUT_2[1] = 2
COMPAR_ASSIGN_ANA_INPUT_2[2] = 1
COMPAR_ASSIGN_ANA_INPUT_2[3] = 3
COMPAR_ASSIGN_ANA_INPUT_2[4] = 3
COMPAR_ASSIGN_ANA_INPUT_2[5] = 1
```

```

COMPAR_ASSIGN_ANA_INPUT_2[6] = 1
COMPAR_ASSIGN_ANA_INPUT_2[7] = 1
Analog input 1 affects input bits 0, 2, 5, 6 and 7 of comparator byte 2
Analog input 2 affects input bit 1 of comparator byte 2
Analog input 3 affects input bits 3 and 4 of comparator byte 2

10600	FRAME_ANGLE_INPUT_MODE			EXP, N01, N09	K2	
-	Sequence of rotation in FRAME			BYTE	PowerOn	
-						
-	-	1	1	2	7/2	M

Description:

FRAME_ANGLE_INPUT_MODE sets how the rotations (ROT and AROT) around the three geometry axes are defined if more than one rotation is programmed in a block. The order in which these rotations are programmed within the block is irrelevant.

The rotations can be set to be calculated according to:

- Euler angle with FRAME_ANGLE_INPUT_MODE = 2
 The rotations are calculated according to the Euler angle in the following order:
 1. Rotation around Z
 2. Rotation around X
 3. Rotation around Y
- RPY with FRAME_ANGLE_INPUT_MODE = 1
 The rotations are calculated according to the Euler angle in the following order:
 1. Rotation around Z
 2. Rotation around Y
 3. Rotation around X

10602	FRAME_GEOAX_CHANGE_MODE			EXP, N01, N09	K2	
-	Frames when changing geometry axes			BYTE	PowerOn	
-						
-	-	0	0	5	7/2	M

Description:

Geometry axes can be switched over in the following states:

- Selection and deselection of transformations
- Switchable geometry axes GEOAX()

The current total frame is then defined as follows:

0: The current total frame is canceled.

1: The current total frame is recalculated when geometry axes are switched over. Translations, scaling and mirroring for the new geometry axes become active. The rotations of the old geometry axes still apply.

2: The current total frame is recalculated when geometry axes are switched over. Translations, scaling and mirroring for the new geometry axes become active. If rotations were active before switching over to the current base frames, current settable frame or programmable frame, switchover is canceled with an alarm.

3: The current total frame is deleted when selecting and deselecting transformations. When the GEOAX() command is entered, the frame is recalculated and transaction, scaling and mirroring for the new geometry axes become active. The rotations of the old geometry axes still apply.

10604	WALIM_GEOAX_CHANGE_MODE			EXP, N01, N09	A3	
-	Working area limitation by changing geometry axes			BYTE	PowerOn	
-						
-	-	0	0	1	7/2	M

Description: This machine data specifies whether a potentially active working area limitation will remain active after geo axis replacement, or whether it will be deactivated.

Meaning of the MD values:

= 0 Working area limitation will be deactivated when replacing geo axis.

= 1 Working area limitation will remain activated when replacing geo axis.

10610	MIRROR_REF_AX			EXP, N01, N09	K2	
-	Reference axis for mirroring			BYTE	PowerOn	
-						
-	-	0	0	3	7/2	M

Description: 0: Mirroring always takes place in the stated axis, without scaling.

The mirroring of a geometry axis can always be related to a defined reference axis.

1: x is the reference axis

Mirroring of the x axis is unique.

Mirroring of the y axis is mapped on:

a mirroring of the x axis and

a rotation of the z axis through 180 degrees.

Mirroring of the z axis is mapped on:

a mirroring of the x axis and

a rotation of the x axis through 180 degrees and

a rotation of the z axis through 180 degrees

2: y is the reference axis

Mirroring of the x axis is mapped on:

a mirroring of the y axis and

a rotation of the z axis through 180 degrees.

Mirroring of the y axis is unique.

Mirroring of the z axis is mapped on:

a mirroring of the y axis and

a rotation of the x axis through 180 degrees

3: z is the reference axis

Mirroring of the x axis is mapped on:

a mirroring of the z axis and

a rotation of the z axis through 180 degrees and

a rotation of the x axis through 180 degrees

Mirroring of the y axis is mapped on:

a mirroring of the z axis and

2.3 NC machine data

a rotation of the x axis through 180 degrees.
Mirroring of the z axis is unique.

10612	MIRROR_TOGGLE			EXP, N01, N09	K2	
-	Mirror toggle			BYTE	PowerOn	
-						
-	-	1	0	1	7/2	M

Description: Mirror toggle function.

1: Programmed axis values are not evaluated. Toggle switching behavior.

0: Programmed axis values are evaluated.

The axes are mirrored in the case of values not equal to 0 if they are not already mirrored. Mirroring is disabled if the value is 0.

10613	NCBFRAME_RESET_MASK			EXP	K2	
-	Active NCU global base frames after reset			UDWORD	Reset	
-						
-	-	0xFFFF	0	0xFFFF	7/2	M

Description: Bit mask for the reset setting of the NCU global base frames which are included in the channel.

The following applies:

When MD20110 \$MC_RESET_MODE_MASK bit0 = 1 and bit14 = 1

The entire base frame is derived on reset from the linking of the NCU global base frame field elements whose bit in the bit mask is 1.

When MD20110 \$MC_RESET_MODE_MASK bit0 = 1 and bit14 = 0

The entire base frame is deselected on reset.

10615	NCBFRAME_POWERON_MASK			EXP, N12	K2	
-	Reset global base frames after power on			UDWORD	PowerOn	
-						
-	-	0	0	0xFFFF	7/2	M

Description: This machine data defines whether global base frames are reset in the data management on Power On.

That is

- Offsets are set to 0,
- Scalings are set to 1.
- Mirroring is disabled.

The individual base frames can be selected separately.

Bit 0 means base frame 0, bit 1 base frame 1 etc.

Value=0: Base frame is retained on Power On

Value=1: Base frame is reset in the data management on Power On.

Related to:

MD24004 \$MC_CHBFRAME_POWERON_MASK

10616	MAPPED_FRAME_MASK			N01	-	
-	Enable frame mapping			UDWORD	PowerOn	
-						
-	-	0x3001	0	0x00007FFF	7/2	M

Description: Bit mask for channel-specific data management frames, the axial frames of which can be mapped onto other axial frames.

The mapping takes place via MD32075 \$MA_MAPPED_FRAME[AXn] = "AXm".

Bit 0: \$P_SETFR System frame for actual value setting and scratching
 Bit 1: \$P_EXTFR System frame for external work offset
 Bit 2: \$P_PARTFR System frame for TCARR and PAROT
 Bit 3: \$P_TOOLFR System frame for TOROT and TOFRAME

10617	FRAME_SAVE_MASK			EXP	K2	
-	Behavior of frames in SAVE subroutines			UDWORD	PowerOn	
-						
-	-	0	0	0x7	7/2	M

Description: This machine data is used to define which frames are restored with SAVE attribute at return from a subprogram.

Bit 0: Settable frames G54 through G599

Value = 0:
If the same G code is active at subprogram return and subprogram call, the active settable frame is maintained. If not, the settable frame is reactivated when the subprogram is called.

Value = 1:
At subprogram return, the settable frame is reactivated when the subprogram is called.

Bit 1: Basic frame

Value = 0:
The active basic frame is not changed at subprogram return. This is also the case if a basic frame change is carried out in the subprogram by an operation or by an implicit frame deselection (possibly through TRAFOOF).

Value = 1:
At subprogram return, the basic frame is reactivated when the subprogram is called.

Bit 2: Grinding frames GFRAME0 through GFRAME100

Value = 0:
If the same G code is active at subprogram return and subprogram call, the active grinding frame is retained. If not, the grinding frame is reactivated when the subprogram is called.

Value = 1:
At subprogram return, the grinding frame is reactivated when the subprogram is called.

2.3 NC machine data

10618	PROTAREA_GEOAX_CHANGE_MODE			EXP, N01, N09	A3	
-	Protection range on change of geometry axes			UBYTE	PowerOn	
-						
-	-	0x0	0x0	0x3	7/2	M

Description: This machine data is used to define whether any active protection zones will remain active after a transformation change or geo axis replacement, or whether they will be deactivated.

The machine data is bit-coded with the following meanings:

Bit 0 = 0

Protection zones deactivated on transformation change.

Bit 0 = 1

Active protection zones remain active after transformation change.

Bit 1 = 0

Protection zones deactivated on geo axis replacement.

Bit 1 = 1

Active protection zones remain active after geo axis replacement.

10619	COLLISION_TOLERANCE			EXP	-	
mm	Tolerance for collision check			DOUBLE	NEW CONF	
-						
-	-	1	0.001	1000.0	7/3	M

Description: This parameter is used to set the required collision check accuracy. This means: If the distance between two protection zones is smaller than this value, a collision of those two protection zones may be signalled. But: Two protection zones that overlap by less than this value cannot be classified as colliding.

10620	EULER_ANGLE_NAME_TAB			N01, N09	F2, TE4	
-	Name of Euler angle			STRING	PowerOn	
-						
-	3	A2, B2, C2	-	-	7/2	M

Description:

- The name entered must not conflict with the designation and assignment of machine and geometry axis names.
- The name entered must not conflict with channel axis names in the channel (MD20080 \$MC_AXCONF_CHANAX_NAME_TAB), names for directional vectors (MD10640 \$MN_DIR_VECTOR_NAME_TAB), names for intermediate point coordinates for CIP (MD10660 \$MN_INTERMEDIATE_POINT_NAME_TAB) or the names for interpolation parameters (MD10650 \$MN_IPO_PARAM_NAME_TAB).
- The name entered must not contain the following reserved address letters:
 - D Tool offset (D function)
 - E Reserved
 - F Feedrate (F function)
 - G Preparatory function
 - H Auxiliary function (H function)
 - L Subprogram call
 - M Special function (M function)
 - N Subblock
 - P Number of subroutine repetitions
 - R Arithmetic parameter
 - S Spindle speed (S function)
 - T Tool (T function)

- Nor are keywords (e.g. DEF, SPOS etc.) or predefined identifiers (e.g. ASPLINE, SOFT) allowed.
- An angle identifier consists of a valid address letter (A, B, C, I, J, K, Q, U, V, W, X, Y, Z), followed by an optional numerical extension (1-99).

10621	COLLISION_PREP_CALC_TIME			EXP	-	
s	Maximum computation time of the preparative collision check.			DOUBLE	NEW CONF	
-						
-	-	0.5	0.0	10.0	1/1	M

Description: The maximum computing time of the preparatory collision check is set with this machine data.

>0: After the set time, the preparatory collision check of the current block is interrupted. That makes computing time available to the external communication.

0: The preparatory collision check is not interrupted. That does not make any computing time available to the external communication during the collision check.

A communication failure may occur between HMI and NCK in extreme cases.

A value of 0.5 s is recommended.

10622	COLLISION_SAFETY_DIST			EXP	-	
mm	Safety distance for collision check			DOUBLE	NEW CONF	
-						
-	-	0.0	0.000	1000.0	7/3	M

Description: If the distance between two protection zones becomes smaller than this safety distance, this is regarded as a collision. This machine data is globally effective for protective zone pairs for which no special safety distance was specified (s. function COLLCHK).

10624	ORIPATH_LIFT_VECTOR_TAB			N01, N09	-	
-	Name of retraction vector for path-relative orientation.			STRING	PowerOn	
-						
-	3	A8, B8, C8	-	-	7/2	M

Description: List of identifiers for components of the retraction vector during reorientations for path relative interpolation of the tool orientation.

The rules for axis identifiers as described in MD20080 \$MC_AXCONF_CHANAX_NAME_TAB apply to the selection of identifiers. The identifiers must be selected so that they do not cause any conflicts with other identifiers (axes, normal vectors, direction vectors, conical interpolation vectors, interpolation parameters, intermediate point coordinates).

10626	ORIPATH_LIFT_FACTOR_NAME			N01, N09	-	
-	Name of relative safety clearance with ORIPATH			STRING	PowerOn	
-						
-	-	ORIPLF	-	-	7/2	M

Description: Identifier for relative factor for determining a safety clearance for the retracting movement during reorientations for path relative interpolation of the tool orientation.

The rules for axis identifiers as described in MD20080 \$MC_AXCONF_CHANAX_NAME_TAB apply to the selection of identifiers. The identifiers must be selected so that they do not cause any conflicts with other identifiers (axes, normal vectors, direction vectors, conical interpolation vectors, interpolation parameters, intermediate point coordinates).

2.3 NC machine data

10630	NORMAL_VECTOR_NAME_TAB			N01, N09	F2	
-	Name of normal vectors			STRING	PowerOn	
-						
-	6	A4, B4, C4, A5, B5, C5	-	-	7/2	M

Description: Normal vector programming from software version 3.2

List of identifiers for the normal vector components at the beginning and end of the block.

The rules for axis identifiers described in MD20080 \$MC_AXCONF_CHANAX_NAME_TAB apply to the selection of identifiers.

The identifiers must be selected so that they do not cause any conflicts with other identifiers (axes, Euler angles, direction vectors, interpolation parameters, intermediate point coordinates).

10640	DIR_VECTOR_NAME_TAB			N01, N09	F2, TE4	
-	Name of direction vectors			STRING	PowerOn	
-						
-	6	A3, B3, C3, AN3, BN3, CN3	-	-	7/2	M

Description: List of identifiers for the direction vector components. (A3 to C3)

List of identifiers for the vector components perpendicular to the direction vector (AN3 to CN3)

The rules for axis identifiers described in MD20080 \$MC_AXCONF_CHANAX_NAME_TAB apply to the selection of identifiers.

The identifiers must be selected so that they do not cause any conflicts with other identifiers (axes, Euler angles, normal vectors, interpolation parameters, intermediate point coordinates).

10642	ROT_VECTOR_NAME_TAB			N01, N09	F2	
-	Name of rotation vectors			STRING	PowerOn	
-						
-	3	A6, B6, C6	-	-	7/2	M

Description: List of identifiers for the rotation vector components in taper direction

The rules for axis identifiers as described in MD20080 \$MC_AXCONF_CHANAX_NAME_TAB apply to the selection of identifiers.

The identifiers must be selected so that they do not cause any conflicts with other identifiers (axes, Euler angles, normal vectors, interpolation parameters, intermediate point coordinates).

10644	INTER_VECTOR_NAME_TAB			N01, N09	F2	
-	Name of intermediate vector components			STRING	PowerOn	
-						
-	3	A7, B7, C7	-	-	7/2	M

Description: List of identifiers for the intermediate vector components

The rules for axis identifiers described in MD20080 \$MC_AXCONF_CHANAX_NAME_TAB apply to the selection of identifiers.

The identifiers must be selected so that they do not cause any conflicts with other identifiers (axes, Euler angles, normal vectors, interpolation parameters, intermediate point coordinates).

10646	ORIENTATION_NAME_TAB			N01, N09	F2	
-	Identifiers for programming a 2nd orientation path			STRING	PowerOn	
-						
-	3	XH, YH, ZH	-	-	7/2	M

Description: List of identifiers for programming of the 2nd space curve for tool orientation
The rules for axis identifiers as described in MD20080 \$MC_AXCONF_CHANAX_NAME_TAB apply to the selection of identifiers.
The identifiers must be selected so that they do not cause any conflicts with other identifiers (axes, Euler angles, normal vectors, interpolation parameters, intermediate point coordinates).

10648	NUTATION_ANGLE_NAME			N01, N09	F2	
-	Name of aperture angle			STRING	PowerOn	
-						
-	-	NUT	-	-	7/2	M

Description: Identifier for the opening angle for orientation interpolation
The rules for axis identifiers as described in MD20080 \$MC_AXCONF_CHANAX_NAME_TAB apply to the selection of identifiers.
The identifiers must be selected so that they do not cause any conflicts with other identifiers (axes, Euler angles, normal vectors, direction vectors, intermediate point coordinates).

10650	IPO_PARAM_NAME_TAB			EXP, N01	K2	
-	Name of interpolation parameters			STRING	PowerOn	
-						
-	3	I, J, K	-	-	7/2	M

Description: List of identifiers for the interpolation parameters
The rules for axis identifiers described in MD20080 \$MC_AXCONF_CHANAX_NAME_TAB apply to the selection of identifiers.
The identifiers must be selected so that they do not cause any conflicts with other identifiers (axes, Euler angles, normal vectors, direction vectors, intermediate point coordinates).
Corresponds with:

10670	STAT_NAME			N01, N09	F2	
-	Name of state information			STRING	PowerOn	
-						
-	-	STAT	-	-	7/2	M

Description: Identifier for position information for solving ambiguities in Cartesian PTP travel.

An identifier must be chosen that does not conflict with other identifiers (e.g. axes, Euler angles, normal vectors, direction vectors, intermediate point coordinates).

10672	TU_NAME			N01, N09	F2	
-	Name of state information of axes			STRING	PowerOn	
-						
-	-	TU	-	-	7/2	M

Description: Identifier for position information of axes for solving ambiguities in Cartesian PTP travel.

An identifier must be chosen that does not conflict with other identifiers (e.g. axes, Euler angles, normal vectors, direction vectors, intermediate point coordinates).

10674	PO_WITHOUT_POLY			N01	F2	
-	Polynomial programming programmable without G function POLY			BOOLEAN	PowerOn	
-						
-	-	FALSE	FALSE	TRUE	7/2	M

Description: Until now, the G function POLY has always had to be active during polynomial programming with PO[xx] = (xx), otherwise an alarm was output.

If MD10674 \$MN_PO_WITHOUT_POLY is set to TRUE, no alarm is output with POLY inactive during polynomial programming. The end point of the polynomial is then approached with the linear interpolation G1.

There is no polynomial interpolation if POLY is inactive.

10682	CONTOUR_SAMPLING_FACTOR			N01, EXP	-	
-	Contour sampling factor			DOUBLE	Reset	
-						
-	-	1.0	0.0	1.0E+301	1/1	M

Description: This factor defines the maximum time interval in which a curved contour is sampled in the interpolator.

The maximum sampling time results from the set interpolation cycle
(see MD10071 \$MN_IPO_CYCLE_TIME),
the factor set with this data, and the tolerance set for the geometry axes in MD33100
\$MA_COMPRESS_POS_TOL[].

10700	PREPROCESSING_LEVEL			N01, N02	V2, K1	
-	Program preprocessing level			UBYTE	PowerOn	
-						
-	-	0x25	0	0x7F	2/2	M

Description:

Bit 0= 0:

No preprocessing

Bit 0= 1:

The call description of the cycles is formed during control power on. All the programs in the directories _N_CUS_DIR, _N_CMA_DIR and _N_CST_DIR can be called in the part program without EXTERNAL declaration. If the parameter interface of a cycle is changed in the control, then this change does not become active until after Power On.

Bit 1=1:

During control power on, all cycles in the directories _N_CUS_DIR, _N_CMA_DIR and _N_CST_DIR are preprocessed to form a process-optimizing compilation. These cycles are then processed more quickly. Changes to the cycle programs do not become active until after the next Power On.

Bit 2=1:

During control power on, the Siemens cycles in the directory _N_CST_DIR are preprocessed to form a process-optimizing compilation (from SW 3.5).

Bit 3=1:

During control power on, the user cycles in the directory _N_CUS_DIR are preprocessed to form a process-optimizing compilation (from SW 3.5).

Bit 4=1:

Preprocessing the user cycles in the directory _N_CMA_DIR

Bit 5=1:

All files marked with PREPRO in the PROG statement line are preprocessed (from SW 6.4)

Bit 5=0:

During control power on, all cycles in the directories activated by bits 1 to 4 are preprocessed. This also applies to programs that are not marked with PREPRO.

Bit 6=1:

The compilation is stored in SRAM if there is inadequate space in DRAM (from SW 7.1).

Memory space is required for preprocessing cycles. Better utilization of memory can be achieved by selective setting of the preprocessing:

The runtime-critical cycles are brought together in one directory. The remaining cycles are in the other directory.

10702	IGNORE_SINGLEBLOCK_MASK			N01	K1, Z1	
-	Prevents stopping at specific blocks in single block mode			UDWORD	PowerOn	
-						
-	-	0	0	0x1FFFF	7/2	M

Description:

This machine data prevents stopping at certain blocks with single block.

Single block stop can be prevented with the following bits of the mask:

Bit0 = 1

2.3 NC machine data

Means that there is no stop in any internal ASUB block. Exception: The single block stop has been explicitly activated by the SBLON command.

There are three different internal ASUBs that are triggered by different events.

- Repos: In the case of the events: change of operating mode to a manual mode (JOG, JOGREF, etc.) unless MODESWITCH_MASK is not set, switch skip block on and off, activate machine data, switch-on overstore, axis replacement, subroutine level cancelation, switch-on single block, switch dry run feedrate on and off, alarm with compensation block.

- Return: Delete distance-to-go, switchover after TEACH-IN (if available), or deselection of MDI with corresponding MODESWITCH_MASK.

- _N_PROG_EVENT_SPF: Parameterizing MD 20108 \$MC_PROG_EVENT_MASK parameterizes the events whereby _N_PROG_EVENT_SPF is executed.

Bit1 = 1

Means that there is no stop in any user ASUB block. Exception: The single block stop has been explicitly activated via the SBLON command.

User ASUBs are linked to an interrupt by the part program command SETINT or via the PI- _N_ASUP_. The interrupt is then activated via PLC or the high-speed inputs, and the user ASUBs are retracted.

This disables machine data MD20117 \$MC_IGNORE_SINGLEBLOCK_ASUP. The NCK behavior corresponds to the machine data assignment MD20117 \$MC_IGNORE_SINGLEBLOCK_ASUP=FFFFFFFF.

Bit2 = 1

Means that there is no stop in any intermediate block. Intermediate blocks are generated at, among other events, tool change, ADIS and complicated geometry.

Bit3 = 1

Means that there is no stop in the block search pickup block. The block search pickup block is the 1st block that is loaded into the main run at the start after the search target has been found in the program.

Bit4 = 1

Means that there is no stop in the INIT blocks. INIT blocks are generated from reset immediately after a part program start.

Bit5 = 1

Means that there is no stop in any subprogram block with the parameter DISPLOF.

Bit6 = 1

Means that there is no stop in any block in which the NCK cannot reorganize.

Reorganize is an internal procedure that is needed for mode change after JOG/ JOGREF..., switch skip block on and off, activate machine data, axis replacement, switch on overstore, switch on single block, switch dry run feedrate on and off, subroutine level cancelation, user ASUBs delete distance-to-go, switchover after TEACH-IN (if available). Reorganize is never needed in Reset state.

Example blocks in which reorganize is impossible:

- Tool change
- 1st block after the Repos procedure
- Block after an ASUB from JOG/canceled

Bit7 = 1

Means that there cannot be a stop in any block in which repositioning is impossible.

Reposition is an internal procedure that is needed for mode change after JOG/ JOGREF..., switch skip block on and off, activate machine data, axis replacement, switch on overstore, switch on single block, switch dry run feedrate on and off, subroutine level cancelation, and possibly user ASUBs. Reposition is never needed in Reset state.

Example blocks in which reposition is impossible:

- G33 + blocks in which reorganize is impossible.

Bit8 = 1

Means that there is no stop in a residual block that does not contain traversing information.

Bit9 = 1

Means that there is no stop in a run in/main run synchronization block (e.g. STOPRE, \$Variable) that is repeated because of an interruption with Reorg (e.g. mode change).

Bit10 = 1

Means that there is no stop in a "tool selection block". "Tool selection block" only occurs with tool management (magazine management or TMMG) active. This block gives the corresponding tool change command to the PLC.

This block is generally generated by T programming from the part program.

Example block "N1010 T="Drill" M6 D1"

Depending on machine data, the "tool selection block" can be held in the interpolator until the PLC has acknowledged the corresponding tool change (see MD20310 \$MC_TOOL_MANAGEMENT_MASK). However the program status remains in "run".

Bit11 = 1

The control has to automatically generate implicit GET blocks for the axis replacement function (axis replacement: 2 or more channels control one axis alternately) if no explicit GET(D) has been programmed and the following block wants to traverse the axis. (The other channel had previously used this axis).

An explicitly programmed GET may appear as follows "getd(x1,y1,z1) or get(x1,y1,z1)".

There is no stop at explicit or implicit GET blocks in the single block with this bit 11.

Bit12 = 1

There is no stop in the single block type 2 in the SBLON block.

Bit13 = 1

If an axis is pulled out in the middle of a block and possibly assigned to another channel, then there is no stop at the PREMATURE end of this block. This block follows a REPOSA in order to traverse it to the end, there is no stop until this end has been reached.

Bit14 = 1

In a part program line, in which a substitution subroutine is called due to NC language replacement, only one stop is performed under the condition that the subroutine includes PROC attribute SBLOF. It is irrelevant whether the subroutine is called at block start and/or end or whether it is exited with M17 or RET.

Bit15 = 1

Means that there is no stop in any user ASUB block. Exception: The single block stop has been explicitly activated via the SBLON command.

There are three different internal ASUBs that are triggered by different events.

- Repos: In the case of the events: change of operating mode to a manual mode (JOG, JOGREF,...) unless MODESWITCH_MASK is not set, switch skip block on and off, activate machine data, switch-on overstore, axis replacement, subroutine level cancelation, switch-on single block, switch dry run feedrate on and off, alarm with compensation block.

- Return: Delete distance-to-go, switchover after TEACH-IN (if available), or deselection of MDI with corresponding MODESWITCH_MASK.

Bit16 = 1

Activating SERUPRO (search run via prog test) prevents stopping at single blocks.

Related to:

MD20117 \$MC_IGNORE_SINGLEBLOCK_ASUP

10703	IGNORE_CFG_STOP_MASK			N01	?	
-	Prevent configured stop			UDWORD	PowerOn	
-						
-	-	0x3	0	0xFFFFFFFF	7/2	M

2.3 NC machine data

Description: This machine data specifies whether the stop function is ignored in certain NC blocks. The following bits of the mask can prevent the configured stop:

Some of the bits have the same meaning for the configured stop as IGNORE_SINGLEBLOCK_MASK for a single block.

Bit0 = 1
Means that a stop in an SBLOF or SBLon is prevented.

Bit1 = 1
Means that a stop in a residual block not containing any traversing information is prevented.

Bit2 = 1
Means that a stop in a block search pickup block is triggered. The block search pickup block is the 1st block that is loaded into the main run at the start after the search target has been found in the program.

Bit3 = 1
Means that a stop by a program event is prevented

There are three different internal ASUBs that are triggered by different events.

- Repos: In the case of the events Change to a manual mode (JOG, JOGREF, etc.) unless MODESWITCH_MASK is not set, Switch skip block on and off, Activate machine data, Switch on overstore, Axis replacement, Subprogram level cancelation, Switch on single block, Switch dry run feedrate on and off, Alarm with compensation block.
- Return: Delete distance-to-go, switchover after TEACH-IN (if available), or deselect MDI with corresponding MODESWITCH_MASK.
- _N_PROG_EVENT_SPF: Parameterizing MD 20108 \$MC_PROG_EVENT_MASK parameterizes the events for which _N_PROG_EVENT_SPF is executed.

Bit4 = 1
Means that a stop by a user ASUB is triggered.

User ASUBs are linked to an interrupt by the part program command SETINT or via the PI- _N_ASUP_. The interrupt is then activated via PLC or the high-speed inputs, and the user ASUBs are retracted.

Bit5 = 1
Means a stop by an internal ASUB is prevented.

There are three different internal ASUBs that are triggered by different events.

- Repos: In the case of the events Change to a manual mode (JOG, JOGREF, etc.) unless MODESWITCH_MASK is not set, Switch skip block on and off, Activate machine data, Switch on overstore, Axis replacement, Subprogram level cancelation, Switch on single block, Switch dry run feedrate on and off, Alarm with compensation block.
- Return: Delete distance-to-go, switchover after TEACH-IN (if available), or deselect MDI with corresponding MODESWITCH_MASK.

10704	DRYRUN_MASK			N01	V1	
-	Dry run feedrate activation			BYTE	PowerOn	
-						
-	-	0	0	2	7/2	M

Description: DRYRUN_MASK == 0

Dryrun can only be switched on or off at the end of the block.

When DRYRUN_MASK = 1 is set, the dry run feedrate can also be activated during program execution (in the part program block).

NOTICE!

After activating dry run feedrate, the axes are stopped for the duration of the reorganization process.

DRYRUN_MASK == 2

Dryrun can be switched on or off in every phase and the axes are not stopped.

NOTICE:

However, the function does not become active until a "later" block in the program execution and this is with the next (implicit) StopRe block.

Related to:

SD42100 \$SC_DRY_RUN_FEED

10706	SLASH_MASK			N01	PG, A2	
-	Activation of block skip			BYTE	PowerOn	
-						
-	-	0	0	2	7/2	M

Description: If SLASH_MASK = 0, skip block can only be activated when stopped at the end of the block
 If SLASH_MASK = 1, skip block can also be activated during program execution.
 NOTICE!
 After activating skip block, the axes are stopped for the duration of the reorganization process.
 If SLASH_MASK = 2, skip block can be activated in every phase.
 Notice!
 However, the function does not become active until a "later" block in the program execution, and this is with the next (implicit) StopRe block.

10707	PROG_TEST_MASK			N01	K1	
-	Program test mode			UDWORD	PowerOn	
-						
-	-	0x11	0	0x1F	7/2	M

Description: Bit-coded mask for program test
 Bit 0 == 1 No function.
 Bit 1 == 1 Enable to activate the program test using the PI command _N_NCKMOD
 Bit 2 == 1 Activation of program test with accelerated feed in normal program processing. If the bit is set, the program test is active in all channels with accelerated feed via the VDI signal in the first channel. The VDI signal has no effect in all other channels as long as the bit is set. The value in \$MC_SERUPRO_SPEED_FACTOR of the first channel is used as the feed. Only released for test purposes.
 Bit 3 == 1 Activation of program test with accelerated feed in the simulation.
 Bit 4 == 1 Activation of accelerated program test takes place in synchronized multi-channel mode.
 Bit 5..31 As yet unused.
 Program test with normal processing is always activated via the VDI interface.
 Program test in simulation is always activated via the NCKMode PI.
 Program test block search is always activated via the Find-Pi.

10708	SERUPRO_MASK			N01	K1	
-	Block search modes			UDWORD	PowerOn	
-						
-	-	0	0	0x3f	7/2	M

Description: Bit-coded mask for block search via program test (abbr. SERUPRO).
 SERUPRO block search is activated with the PI service _N_FINDBL mode parameter == 5.
 SERUPRO means SEarchRUN by PROgram test; in other words, proceed under program test from start of program to search target. Note: Program test does not move any axes.

2.3 NC machine data

Bit 0 == 0
There is a stop at M0 during the search phase.

Bit 0 == 1
There is no stop at M0 during the search phase.

Bit 1 == 0
Alarm 16942 cancels the search phase on part program command START.

Bit 1 == 1
Alarm 16942 is switched off.

NOTICE:
A start program command might actually start the other channel!

Bit 2 == 0
Switches the function "Group SERUPRO" off

Bit 2 == 1
Switches the function "Group SERUPRO" on.

"Group SERUPRO" enables a search routine in which the start part program command is changed into a search routine for the other channel.

Bit 3 == 0
Forces all channels that have started SERUPRO to end SERUPRO simultaneously unless they are canceled via Reset or the channel reaches M30 without finding the search target. In other words, all channels that find the search target (including self-acting SERUPRO) terminate SERUPRO simultaneously.

Bit 3 == 1
Switches this function off

Bit 4 == 0
Take external override into account in SERUPRO.

Bit 4 == 1
An external override (sent via PLC signal or MCP) is ignored during SERUPRO.

Bit 5 == 0
With SERUPRO, complex path calculations are made.

Bit 5 == 1
With SERUPRO, calculation is made with simple, computing-time-optimized algorithms.

Bit 6 .. 31
As yet unused.

10709	PROG_SD_POWERON_INIT_TAB			EXP, N01	K1	
-	Setting data to be initialized			DWORD	PowerOn	
-						
-	30	43200, 43202, 0, 0, 0, 0, 0, 0...	-	-	7/2	M

Description:

Setting data to be initialized:

The values of the programmable SD indicated in this MD are set to their initial values on control power up.

Only the setting data listed in the table below, however, can be initialized. If invalid setting data numbers are configured, then the alarm 4009 is output at the next run-up of the control. The alarm shows the index used for configuring the invalid setting data. The alarm can only be eliminated by changing the invalid setting data, i.e. by entering either a valid number or zero!

10712	NC_USER_CODE_CONF_NAME_TAB			EXP, N01, N12	TE1, B1	
-	List of reconfigured NC codes			STRING	PowerOn	
-						
-	200	-	-	-	2/2	M

Description: List of identifiers of the NC codes reconfigured by the user.

The list is to be structured as follows:

Even address: Identifier to be changed

Subsequent odd address: New identifier

The following three types of NC codes can be reconfigured:

1. G codes e.g.: G02, G64, ASPLINE...
2. NC addresses e.g.: RND, CHF, ...
3. Pre-defined subprograms e.g.: CONTPRON, ...

10713	M_NO_FCT_STOPRE			EXP, N12, N07	H2	
-	M function with preprocessing stop			DWORD	PowerOn	
-						
-	15	-1, -1, -1, -1, -1, -1, -1, -1...	-	-	7/2	M

Description: The M functions defined by MD10713 \$MN_M_NO_FCT_STOPRE perform an implicit preprocessing stop.

That is, the interpretation of the next part program line will be stopped until the block with the M function defined in that way has been processed completely (PLC acknowledgment, motion, etc.).

10714	M_NO_FCT_EOP			EXP, N07	K1, H2	
-	M function for spindle active after reset			DWORD	PowerOn	
-						
-	-	-1	-	-	7/2	M

Description: For spindles where a '2' is configured in MD35040 \$MA_SPIND_ACTIVE_AFTER_RESET, no spindle reset is enabled with this M function when the part program is terminated. The spindle therefore remains active after the end of the part program.

Proposal: M32

Restrictions: see MD10715 \$MN_M_NO_FCT_CYCLE

10715	M_NO_FCT_CYCLE			EXP, N12, N07	H2, K1	
-	M function to be replaced by a subroutine			DWORD	PowerOn	
-						
-	30	-1, -1, -1, -1, -1, -1, -1, -1...	-	-	7/2	M

Description:

M number with which a subprogram is called.

The name of the subprogram is stated in MD10716 \$MN_M_NO_FCT_CYCLE_NAME[n]. If the M function defined in MD10715 \$MN_M_NO_FCT_CYCLE[n] is programmed in a part program block, the subprogram defined in MD10716 \$MN_NO_FCT_CYCLE_NAME[n] will be started at the end of the block. If the M function is programmed again in the subprogram, no further substitution is performed by a subprogram call. Other substitutions configured in MD10715 \$MN_M_NO_FCT_CYCLE are not performed in the subprogram either. MD10715 \$MN_M_NO_FCT_CYCLE[n] is effective both in Siemens mode G290 and in external language mode G291.

The subprograms configured with MD10716 \$MN_M_NO_FCT_CYCLE_NAME[n] and MD10717 \$MN_T_NO_FCT_CYCLE_NAME must not be active simultaneously in one block (line of a part program). This means that no more than one M/T function replacement can be active in any one block. Neither an M98 nor a modal subprogram call may be programmed in a block with the M function replacement.

Subprogram return and end of part program are also not permitted. Alarm 14016 is output in the event of a conflict.

Restrictions:

M functions with a fixed meaning and configurable M functions are checked for conflicting settings. A conflict is reported with an alarm.

The following M functions are checked:

- M0 to M5,
- M17, M30,
- M19,
- M40 to M45,
- M function for spindle/axis mode switchover according to MD20094 \$MC_SPIND_RIGID_TAPPING_M_NR (default: M70),
- M functions for nibbling/punching as configured in MD26008 \$MC_NIBBLE_PUNCH_CODE if activated by MD26012 \$MC_PUNCHNIB_ACTIVATION.
- M19, M96-M99 for applied external language (MD18800 \$MN_MM_EXTERN_LANGUAGE).

Exception: The M functions for the tool change defined by MD22560 \$MC_TOOL_CHANGE_M_CODE.

2.3 NC machine data

10716	M_NO_FCT_CYCLE_NAME			EXP, N12, N07	K1	
-	Subroutine name for M function replacement			STRING	PowerOn	
-						
-	30	-	-	-	7/2	M

Description:

The machine data contains the name of the cycle. This cycle is called if the M function has been programmed from MD10715 \$MN_M_NO_FCT_CYCLE.

If the M function is programmed in a motion block, the cycle is executed after the motion.

MD10715 \$MN_M_NO_FCT_CYCLE is active in both Siemens mode G290 and in external language mode G291.

If a T number is programmed in the call block, then the programmed T number can be polled in the cycle under the variable \$P_TOOL.

M and T function replacements must not be programmed simultaneously in one block. This means that not more than one M or T function replacement may be active in any one block.

Neither an M98 nor a modal subprogram call may be programmed in a block with M function replacement.

Moreover, neither subprogram return nor part program end are allowed.

Alarm 14016 is issued if there is a conflict.

Related to:

MD10715 \$MN_M_NO_FCT_CYCLE,

MD10717 \$MN_T_NO_FCT_CYCLE_NAME

10717	T_NO_FCT_CYCLE_NAME			EXP, N12, N07	K1	
-	Name of tool-changing cycle for T function replacement			STRING	PowerOn	
-						
-	-	-	-	-	7/2	M

Description:

Cycle name for tool change routine on call-up with a T function.

If a T function is programmed in a part program block, the subprogram defined in T_NO_FCT_CYCLE_NAME is called at the end of the block.

The T number programmed can be polled in the cycle via system variables \$C_T / \$C_T_PROG as a decimal value and via \$C_TS / \$C_TS_PROG as a string (only with tool management). MD10717 \$MN_T_NO_FCT_CYCLE_NAME is active both in Siemens mode G290 and in external language mode G291.

MD10716 \$MN_M_NO_FCT_CYCLE_NAME and MD10717 \$MN_T_NO_FCT_CYCLE_NAME must not be active in one block at the same time, i.e. no more than one M/T function replacement can be active per block. Neither an M98 nor a modal subprogram call can be programmed in a block with a T function replacement. Furthermore, neither subprogram return nor part program end are allowed.

Alarm 14016 is output in the event of a conflict.

Related to:

MD10715 \$MN_M_NO_FCT_CYCLE,

MD10716 \$MN_M_NO_FCT_CYCLE_NAME

10718	M_NO_FCT_CYCLE_PAR			EXP, N12, N07	K1	
-	M function replacement with parameters			DWORD	PowerOn	
-						
-	-	-1	-	-	7/2	M

Description: If an M function replacement was configured with MD10715 \$MN_M_NO_FCT_CYCLE[n] / MD10716 \$MN_M_NO_FCT_CYCLE_NAME[n], a parameter transfer via system variable can be specified for one of these M functions using MD10718 \$MN_M_NO_FCT_CYCLE_PAR, in the same way as T function replacement. The parameters stored in the system variables always refer to the part program line where the M function to be replaced was programmed.

The following system variables are available:

\$C_ME : Address extension of the replaced M function
 \$C_T_PROG : TRUE if address T was programmed
 \$C_T : Value of address T (Integer)
 \$C_TE : Address extension of address T
 \$C_TS_PROG : TRUE if address TS was programmed
 \$C_TS : Value of address TS (string, only with tool management)
 \$C_D_PROG : TRUE if address D was programmed
 \$C_D : Value of address D
 \$C_DL_PROG : TRUE if address DL was programmed
 \$C_DL : Value of address DL

10719	T_NO_FCT_CYCLE_MODE			EXP, N12, N07	K1	
-	Setting of T function substitution			UDWORD	PowerOn	
-						
-	-	0	0	0x7	7/2	M

Description: This machine data parameterizes the execution of the replacement subprogram for the tool and tool offset selection.

Bit 0 = 0:

D or DL number is transferred to the replacement subprogram (default value)

Bit 0 = 1:

The D or DL number is not transferred to the replacement subprogram if the following conditions are fulfilled: MD22550 \$MC_TOOL_CHANGE_MODE = 1 Programming D/DL with T or M function with which the tool change cycle is called, in a part program line.

Bit 1 = 0

Execution of the replacement subprogram at end of block (default value)

Bit 1 = 1

Execution of the replacement subprogram at block start

Bit 2 = 0:

Execution of the replacement subprogram according to the setting of bit 1

Bit 2 = 1:

Execution of the replacement subprogram at block start and at end of block.

10720	OPERATING_MODE_DEFAULT			N01	H2	
-	Setting of mode after power ON			BYTE	PowerOn	
-						
-	10	7, 7, 7, 7, 7, 7, 7...	0	12	7/2	M

Description: Default modes of the mode groups after power ON.

If no mode is selected by the PLC, all the channels associated with mode group n are in the mode preset by OPERATING_MODE_DEFAULT[n -1] after power ON:

0 = Automatic mode

1 = Automatic mode, submode REPOS

2 = MDI mode

3 = MDI mode, submode REPOS

4 = MDI mode, submode Teach In

2.3 NC machine data

5 = MDI mode, submode Reference point approach

6 = JOG mode

7 = JOG mode, submode Reference point approach

8 = AUTO mode, submode Teach In

9 = AUTO mode, submode Teach In, submode Reference point approach

10 = AUTO mode, submode Teach In, submode Repos

11 = MDI mode, submode Teach In, submode Reference point approach

12 = MDI mode, submode Teach In, submode Repos

NOTICE! Depending on the machine data MD10721 \$MN_OPERATING_MODE_EXTENDED, the mode set here might not be adopted after power ON

10721	OPERATING_MODE_EXTENDED			N01	H2	
-	Extended setting of mode after power ON			BYTE	PowerOn	
-						
-	10	0, 0, 0, 0, 0, 0, 0, 0...	0	1	7/2	M

Description: Extended setting of an operating mode of the operating mode groups after power on:
 0 = Selection of the operating mode according to MD10720 \$MN_OPERATING_MODE_DEFAULT
 1 = Selection of the JOG mode if the PLC signal "Retract data available" (DB21-30 DBX377.5) is set in at least one channel of the operating mode group

10722	AXCHANGE_MASK			EXP, N01	K5	
-	Parameterization for axis replacement behavior			UDWORD	PowerOn	
-						
-	-	0	0	0xFFFF	7/2	M

Description: The axis replacement behavior can be changed with this machine data.

Bit0 = 1
 Means that there is an automatic axis replacement via channels even if the axis has been brought into a neutral state by Waitp.

Bit1 = 1
 Means that an AXCTSWE fetches all the axis container axes that can be assigned to the channel by means of implicit GET or GETD, and an axis replacement is not permitted again until after the axis container rotation.

Bit2 = 1
 Means that, in the case of a GET, an intermediate block without preprocessing stop is generated, and whether a reorganization is needed is not checked until main run.

Bit3 = 1 means, that the NC carries out an axis replacement request for the VDI interface only for:

- an axis exclusively controlled by the PLC (MD30460 \$MA_BASE_FUNCTION_MASK Bit 4 == 1)
- a permanently assigned PLC axis (MD30460 \$MA_BASE_FUNCTION_MASK Bit 5 == 1)

For such axes, the VDI interface signal 'Axis replacement possible' is always 1.

For all other axes, the VDI interface signal 'Axis replacement possible' is always 0.

For permanently assigned PLC axes, an axis replacement is possible only from neutral axis to PLC axis

or from PLC axis to neutral axis.

Bit3 = 0 means that an axis replacement can be requested by the PLC for each axis.

For permanently assigned PLC axes, an axis replacement is only possible from neutral axis to PLC axis

or from PLC axis to neutral axis.

10724	NC_SYS_CODE_CONF_NAME_TAB			EXP, N01	TE1, B1	
-	List of reconfigured NC codes			STRING	PowerOn	
-						
-	20	-	-	-	ReadOnly	S

Description: Identifier list of internal NC codes
Reserved for internal applications

10735	JOG_MODE_MASK			EXP, N01	K1	
-	Settings for JOG mode			UDWORD	PowerOn	
-						
-	-	0	0	0x1ff	7/2	M

Description:

Bit 0:
Enables JOG in automatic.
JOG is enabled in automatic when all channels in the mode group are in the RESET state and no channel of the DRF mode group has been selected. The mode group changes internally to JOG with the +/- key and the handwheel, and the axis moves. After the JOG motion has ended, a change back to AUTO is also made internally.

Bit 1:
Position with AxFrame.
The function 'JOG to position' considers all axial frames and, in the case of an axis configured as geometry axis, the tool length offset.

Bit 2:
Travel in opposite direction.
The functions 'JOG to position' and 'Approach machine fixed point manually' allow travel in opposite direction, i.e. away from the specified position.

Bit 3:
Tool radius offset.
MD21020 \$MC_WORKAREA_WITH_TOOL_RADIUS is active with JOG motions of the geometry axes.

Bit 4:
Alarm suppression operating range limit in the basic coordinate system in JOG.
Alarms that would be output in JOG when an operating range limit is reached in the basic coordinate system, are suppressed.

Bit 5:
Alarm suppression operating range limit in the workpiece coordinate system in JOG.
Alarms that would be output in JOG when an operating range limit is reached in the workpiece coordinate system, are suppressed.

Bit 6, 7:
JOG of circles:
Bit 7 and bit 6 = 0: traversing the 2nd geometry axis of the active plane to PLUS for radius increase, traversing to MINUS for radius decrease independently of inner or outer machining being active.
Bit 7 = 1 and bit 6 = 0: traversing the 2nd geometry axis of the active plane to PLUS always travels in the direction of the limiting circle. This means that the radius is increased on inner machining and decreased on outer machining.
Bit 7 = 1 and bit 6 = 1: traversing the 2nd geometry axis of the active plane to MINUS always travels in the direction of the limiting circle. This means that the radius is increased on inner machining and decreased on outer machining.

Bit 8:
Bit 8 = 0 If there is a JOG retract movement, the retraction axis can only be jogged in the plus direction.

2.3 NC machine data

Bit 8 = 1 If there is a JOG retract movement, the retraction axis can only be jogged in the plus and minus direction.

Bits 9-31:

Currently unassigned.

10750	SPRINT_FORMAT_P_CODE			N12	PGA	
-	String coding of the SPRINT format %P			DWORD	PowerOn	
-						
-	-	0	0	2	7/2	1

Description:

Description:

Specification of the character or punched tape code used to code the string which the SPRINT command generates with format control character %P:

0: ASCII

1: ISO (DIN66024)

2: EIA (RS-244)

10751	SPRINT_FORMAT_P_DECIMAL			N12	PGA	
-	Parameterization of the SPRINT format %P			DWORD	PowerOn	
-						
-	-	0	0	1	7/2	1

Description:

Description:

Parameterization of the format description %n.mP of the SPRINT command

Value range:

0: The format specification %n.mP generates a string from a transfer parameter of type REAL or INT consisting of an integer with n + m places. The first n places represent the integer places and the following m places the decimal places of the transfer parameter. Missing decimal places are filled with 0. If there are more than m decimal places, the number is rounded. Missing integer places are filled with spaces.

1: The format specification %n.mP generates a string from a transfer parameter of type REAL or INT that consists of a decimal number with up to n integer places, the decimal point and m decimal places, which are filled with 0 or rounded as necessary.

10760	G53_TOOLCORR			N12	FBFA	
-	Method of operation of G53, G153 and SUPA			UDWORD	NEW CONF	
-						
-	-	0	0	0x3	7/2	M

Description:

With this MD you define whether tool length offset and tool radius offset are also to be suppressed with language commands G53, G153 and SUPA

The machine data is bit-coded.

Bit 0 = 0: G53, G153 and SUPA cause block-by-block suppression of work offsets. The active tool length offset and tool radius offset remain active.

Bit 0 = 1: G53, G153 and SUPA cause block-by-block suppression of work offsets, active tool length offset and tool radius offset. The tool length behavior can be modified with bit 1.

Bit 1 is only evaluated, if the value of bit 0 is 1.

Bit1 = 0: with bit 0 set, the tool length is always suppressed with G53, G153 and SUPA.

Bit1 = 1: with bit 0 set the tool length is only suppressed with G53, G153 and SUPA, if a cutting edge is not selected in the same block (this can also be the cutting edge that is already active).

10800	EXTERN_CHAN_SYNC_M_NO_MIN	EXP, N12	H2
-	1st M function for channel synchronization	DWORD	PowerOn
-			
-	-	-1	-
-	-	-	7/2
-	-	-	M

Description: M number of the first M function which can be used to perform a channel (program) synchronization in ISO2/3 mode.

To avoid conflicts with standard M functions the lowest permissible value is 100. If you enter a value between 0 and 99, alarm 4170 will be issued.

10802	EXTERN_CHAN_SYNC_M_NO_MAX	EXP, N12	H2
-	Last M function for channel synchronization	DWORD	PowerOn
-			
-	-	-1	-
-	-	-	7/2
-	-	-	M

Description: M number of the last M function which can be used to perform a channel (program) synchronization in ISO2/3 mode.

In combination with MD10800 \$MN_EXTERN_CHAN_SYNC_M_NO_MIN, the machine data defines an M number range reserved for channel synchronization. This range may be a maximum of 10 times the number of channels as only 10 WAIT marks may be set for each channel.

Alarm 4170 is output if a value is entered between 0 and 99 or less than MD10800 \$MN_EXTERN_CHAN_SYNC_M_NO_MIN.

10804	EXTERN_M_NO_SET_INT	EXP, N12	H2, K1
-	M function to activate ASUB	DWORD	PowerOn
-			
-	-	96	-
-	-	-	7/2
-	-	-	M

Description: M function number used to activate an interrupt program (ASUB) in ISO2/3 mode. The interrupt program is always started by the 1st high-speed input of the numerical control.

The M number defined in the machine data replaces M96 in external language mode.

Restrictions: Refer to MD10715 \$MN_M_NO_FCT_CYCLE

10808	EXTERN_INTERRUPT_BITS_M96			EXP, N12	FBFA	
-	Activate interrupt program (ASUB)			UDWORD	PowerOn	
-						
-	-	0	0	0x7FFFFFFF	7/2	M

Description:

Setting the various bits can influence the processing of the interrupt routine activated by M96 P...

Bit 0 = 0,

No interrupt program possible, M96/M97 are normal M functions

Bit 0 = 1,

Using M96/M97 to activate an interrupt program is allowed

Bit 1 = 0,

Continue processing part program at the final position of the next block after the interrupt block

Bit 1 = 1,

Continue processing part program from interrupt position

Bit 2 = 0,

The interrupt signal immediately interrupts the current block and starts the interrupt routine

Bit 2 = 1,

The interrupt routine will not be started until the end of the block

Bit 3 = 0,

Interrupt machining cycle at an interrupt signal

Bit 3 = 1,

Do not start interrupt program until the end of a machining cycle.

10810	EXTERN_MEAS_G31_P_SIGNAL			EXP, N12	FBFA	
-	Config. of measuring inputs for G31 P..			UBYTE	PowerOn	
-						
-	4	1, 1, 1, 1	0	0x3	7/2	M

Description:

This machine data defines the assignment of measurement inputs 1 and 2 to the P numbers programmed with G31 P1 (- P4). The machine data is bit-coded. Only bits 0 and 1 are evaluated. For example, if bit 0 = 1 in MD10810 \$MN_EXTERN_MEAS_G31_P_SIGNAL[1], the 1st measurement input is activated with G31 P2. If MD10810 \$MN_EXTERN_MEAS_G31_P_SIGNAL[3]=2, the 2nd measurement input is activated with G31 P4.

Bit 0: = 0, Do not evaluate measurement input 1 with G31 P1 (- P4)

Bit 0: = 1, Activate measurement input 1 with G31 P1 (- P4)

Bit 1: = 0, Do not evaluate measurement input 2 with G31 P1 (- P4)

Bit 1: = 1, Activate measurement input 2 with G31 P1 (- P4)

10812	EXTERN_DOUBLE_TURRET_ON			EXP, N12	FBFA	
-	Double turret with G68			BOOLEAN	PowerOn	
-						
-	-	FALSE	FALSE	TRUE	7/2	M

Description: This machine data is used to determine whether double-slide machining (channel synchronization for 1st and 2nd channel) is to be started using G68 or whether the second tool of a double turret (= two closely-linked tools at a distance defined in the MD42162 SC_EXTERN_DOUBLE_TURRET_DIST) is to be activated.

FALSE:
Channel synchronization for double-slide machining

TRUE:
Load 2nd tool of a double turret (that is, activate
\$SC_EXTERN_DOUBLE_TURRET_DISTANCE as additive work offset and mirroring around Z axis)

10814	EXTERN_M_NO_MAC_CYCLE			EXP, N12	H2, K1	
-	Macro call via M function			DWORD	PowerOn	
-						
-	30	-1, -1, -1, -1, -1, -1, -1, -1...	-	-	7/2	M

Description: A macro is called with this M number.

The name of the subprogram is stated in MD10815 \$MN_EXTERN_M_NO_MAC_CYCLE_NAME[n].

If the M function specified with MD10814 \$MN_EXTERN_M_NO_MAC_CYCLE[n] is programmed in a part program block, the subprogram defined in MD10815 \$MN_EXTERN_M_NO_MAC_CYCLE_NAME[n] is started. All addresses programmed in the block are written into the corresponding variables.

If the M function is programmed again in the subprogram, there is no longer a replacement by a subprogram call.

MD10814 \$MN_EXTERN_M_NO_MAC_CYCLE[n] is only active in the external language mode G291.

The subprograms configured with MD10815 \$MN_EXTERN_M_NO_MAC_CYCLE_NAME[n] must not be active simultaneously in a block (part program line), i.e. only one M function replacement can become active in any one block. Neither an M98 nor a modal subprogram call may be programmed in the block with the M function replacement.

Subprogram return and the part program end are also not permitted. Alarm 14016 is issued in case of a conflict. Restrictions: see MD10715 \$MN_M_NO_FCT_CYCLE

2.3 NC machine data

10815	EXTERN_M_NO_MAC_CYCLE_NAME			EXP, N12	H2	
-	Name of subroutine for M function macro call			STRING	PowerOn	
-						
-	30	-	-	-	7/2	M

Description: Name of the subprogram started by a call via the M function defined by MD10814
\$MN_EXTERN_M_NO_MAC_CYCLE[n].

10816	EXTERN_G_NO_MAC_CYCLE			EXP, N12	FBFA	
-	Macro call via G function			DOUBLE	PowerOn	
-						
-	50	-1., -1., -1., -1., -1., -1., -1., -1....	-MD_DBLMAX	1.0E+301	7/2	M

Description: G number for calling a macro.
The name of the subprogram is stated in MD10817 \$MN_EXTERN_G_NO_MAC_CYCLE_NAME[n].
If the G function specified with MD10816 \$MN_EXTERN_G_NO_MAC_CYCLE[n] is programmed in a part program block, the subprogram defined in MD10817 \$MN_EXTERN_M_NO_MAC_CYCLE_NAME[n] is started. All addresses programmed in the block are written in the corresponding \$C_xx variables.
No subprogram call is executed if a subprogram call is already active via an M/G macro or an M replacement. If a standard G function is programmed in this case, this code is executed. Otherwise, alarm 12470 is issued.
MD10816 \$MN_EXTERN_G_NO_MAC_CYCLE[n] is only active in the external language mode G291.
Only a single subprogram call may be included in any one block. This means that only a single M/G function replacement may be programmed in a block, and no additional subprogram (M98) or cycle call may be included in the block.
Furthermore, a subprogram return and a part program end are not permitted in the same block.
Alarm 14016 is issued in case of a conflict.

10817	EXTERN_G_NO_MAC_CYCLE_NAME			EXP, N12	FBFA

-	-	FALSE	FALSE	TRUE	7/2	M

Description: This machine data is active for external programming languages, that is if MD18800 \$MN_MM_EXTERN_LANGUAGE = 1.
This machine data specifies which incremental system is active:
0: Incremental system IS-B = 0.001 mm/degree
= 0.0001 inch
1: Incremental system IS-C = 0.0001 mm/degree
= 0.00001 inch
Related to:
MD10884 \$MN_EXTERN_FLOATINGPOINT_PROG

10888	EXTERN_DIGITS_TOOL_NO			N12	FBFA	
-	Digits for T number in ISO mode			BYTE	PowerOn	
-						
-	-	2	0	8	7/2	M

Description: This machine data is only active when MD10880 \$MN_MM_EXTERN_CNC_SYSTEM == 2.
Number of digits of the tool number in the programmed T word.
From the programmed T word, the number of leading digits specified in MD10888 \$MN_EXTERN_DIGITS_TOOL_NO are interpreted as the tool number.
The following digits address the offset memory.
Entering a value > 0 in MD10889 \$MN_EXTERN_DIGITS_OFFSET_NO renders MD10888 \$MN_EXTERN_DIGITS_TOOL_NO ineffective.

MD10889 \$MN_EXTERN_DIGITS_OFFSET_NO has priority over MD10888
\$MN_EXTERN_DIGITS_TOOL_NO.

10889	EXTERN_DIGITS_OFFSET_NO	N12	FBFA
-	Digits for offset number in ISO mode	BYTE	PowerOn
-			
-	-	0	0
-	-	8	7/2
-	-		M

Description: This machine data is only active when MD10880 \$MN_MM_EXTERN_CNC_SYSTEM == 2.
Number of digits of the offset number in the programmed T word.
From the programmed T word, the number of leading digits specified in MD10889
\$MN_EXTERN_DIGITS_OFFSET_NO are interpreted as the offset number.
The following digits address the tool number.

10890	EXTERN_TOOLPROG_MODE	N12	FBFA
-	Tool change programming for external language	UDWORD	PowerOn
-			
-	-	0x0	0
-	-	0x7FFFFFFF	7/2
-	-		M

Description: Configuration for programming the tool change in an external programming language:
Bit0=0:
Only active for the ISO mode turning: The tool number and offset number are programmed in the T word. \$MN_DIGITS_TOOLNO defines the number of leading digits, which form the tool number.
Example:
\$MN_DIGITS_TOOLNO = 2
T=1234 ; tool number 12,
; offset number 34
Bit0=1:
Only active in the ISO mode turning: Only the tool number is programmed in the T word. Offset number == tool number. \$MN_DIGITS_TOOLNO is irrelevant.
Example:
T=12 ; tool number 12
; offset number 12
Bit1=0:
Only active in the ISO mode turning:
If the number of digits programmed in the T word is the same as the number defined in MD10888 \$MN_EXTERN_DIGITS_TOOL_NO, then leading 0s are added
Bit1=1:
Is only active for the ISO mode turning:
If the number of digits programmed in the T word is the same as the number of digits specified in MD10888 \$MN_EXTERN_DIGITS_TOOL_NO, the programmed number is the offset number and tool number
Bit2=0:
Is only active for the ISO mode turning: ISO T offset selection only with D (Siemens cutting edge number)
Bit2=1:
Is only active for the ISO mode turning: ISO T offset selection only with H (\$TC_DPH[t,d])
Bit6=0:
The offset memories for the tool length and tool radius are linked so that tool length and tool radius are always selected when either H or D is programmed.
Bit6=1:

2.3 NC machine data

The offset memories for the tool length and tool radius are not linked, so that the number of the tool length value is selected when H is programmed, and the number of the tool radius value is selected when D is programmed.

Bit7=0:

Is only active for the ISO mode turning. If T substitution (MD10717 \$MN_T_NO_FCT_CYCLE_NAME) is active, the H number programmed in the T word is transferred to the cycle in the variable \$C_D.

Bit7=1:

Is only active in the ISO mode turning. If T substitution (MD10717 \$MN_T_NO_FCT_CYCLE_NAME) is active, the Siemens cutting edge number D corresponding to the H number programmed in the T word is transferred to the cycle in the variable \$C_D.

10900	INDEX_AX_LENGTH_POS_TAB_1			N09	T1	
-	Number of positions for indexing axis table 1			DWORD	Reset	
-						
-	-	0	0	60	7/2	M

Description:

The indexing position table is used to assign the axis positions in the valid unit of measurement (mm, inches or degrees) to the indexing positions [n] on the indexing axis. The number of indexing positions used in table 1 is defined by MD10900 \$MN_INDEX_AX_LENGTH_POS_TAB_1.

These indexing positions must be assigned valid values in table 1. Any indexing positions in the table above the number specified in the machine data are ignored. Up to 60 indexing positions (0 to 59) can be entered in the table.

Table length = 0 means that the table is not evaluated. If the length is not equal to 0, then the table must be assigned to an axis with MD30500 \$MA_INDEX_AX_ASSIGN_POS_TAB.

If the indexing axis is defined as a rotary axis (MD30300 \$MA_IS_ROT_AX = "1") with modulo 360° (MD30310 \$MA_ROT_IS_MODULO = "1"), the machine data defines the last indexing position after which, with a further traversing movement in the positive direction, the indexing positions begin again at 1.

Special cases:

Alarm 17090 "Value violates upper limit" if values over 60 are entered in MD10900 \$MN_INDEX_AX_LENGTH_POS_TAB_1.

Related to:

MD30500 \$MA_INDEX_AX_ASSIGN_POS_TAB (axis is an indexing axis)

MD10910 \$MN_INDEX_AX_POS_TAB_1 (indexing position table 1)

MD30300 \$MA_IS_ROT_AX (rotary axis)

MD30310 \$MA_ROT_IS_MODULO (modulo conversion for rotary axis)

10910	INDEX_AX_POS_TAB_1			N09	T1	
mm/inch, degrees	Indexing position table 1			DOUBLE	Reset	
-						
-	60	0., 0., 0., 0., 0., 0., 0., 0., 0....	-MD_DBLMAX	1.0E+301	7/2	M

Description:

The indexing position table is used to assign the axis positions in the valid unit of measurement (mm, inches or degrees) to the indexing positions [n] on the indexing axis. [n] = indexing for the entry of the indexing positions in the indexing position table.

Range: 0 y n x 59, where 0 corresponds to the 1st indexing position and 59 to the 60th indexing position.

Note.

Programming with the absolute indexing position (e.g. CAC) starts with indexing position 1. This corresponds to the indexing position with indexing $n = 0$ in the indexing position table.

The following should be noted when entering the indexing positions:

- Up to 60 different indexing positions can be stored in the table.
- The 1st entry in the table corresponds to indexing position 1; the nth entry corresponds to indexing position n.
- The indexing positions must be entered in the table in ascending order (starting with the negative and going to the positive traversing range) with no gaps between the entries. Consecutive position values must not be identical.
- If the indexing axis is defined as a rotary axis (MD30300 \$MA_IS_ROT_AX = "1") with modulo 360° (MD30310 \$MA_ROT_IS_MODULO = "1"), then the position values are limited to a range of $0^\circ \times \text{pos.} < 360^\circ$.

The number of indexing positions used in the table is defined by MD10900 \$MN_INDEX_AX_LENGTH_POS_TAB_1.

Entering the value 1 in axial MD30500 \$MA_INDEX_AX_ASSIGN_POS_TAB assigns indexing position table 1 to the current axis.

Special cases:

Alarm 17020 "Illegal array index" if over 60 positions are entered in the table.

Related to:

MD30500 \$MA_INDEX_AX_ASSIGN_POS_TAB (axis is an indexing axis)

MD10900 \$MN_INDEX_AX_LENGTH_POS_TAB_1 (number of indexing positions used in table 1)

MD30300 \$MA_IS_ROT_AX (rotary axis)

MD30310 \$MA_ROT_IS_MODULO (modulo conversion for rotary axis)

10920	INDEX_AX_LENGTH_POS_TAB_2	N09	T1
-	Number of positions for indexing axis table 2	DWORD	Reset
-			
-	-	0	0
-	-	60	7/2
-	-		M

Description:

The indexing position table is used to assign the axis positions in the valid unit of measurement (mm, inches or degrees) to the indexing positions [n] on the indexing axis. The number of indexing positions used in table 2 is defined by MD10920 \$MN_INDEX_AX_LENGTH_POS_TAB_2.

These indexing positions in table 2 must be assigned valid values. Any indexing positions in the table above the number specified in the machine data are ignored.

Up to 60 indexing positions (0 to 59) can be entered in the table.

Table length = 0 means that the table is not evaluated. If the length is not equal to 0, the table must be assigned to an axis with MD30500 \$MA_INDEX_AX_ASSIGN_POS_TAB.

If the indexing axis is defined as a rotary axis (MD30300 \$MA_IS_ROT_AX = "1") with modulo 360° (MD30310 \$MA_ROT_IS_MODULO = "1"), the machine data defines the last indexing position after which, with a further traversing movement in the positive direction, the indexing positions begin again at 1.

Not relevant for tool magazines (turrets, chain magazines)

Special cases:

Alarm 17090 "Value violates upper limit" if a value over 60 is entered in MD10920 \$MN_INDEX_AX_LENGTH_POS_TAB_2.

Related to:

MD30500 \$MA_INDEX_AX_ASSIGN_POS_TAB (axis is an indexing axis)

MD10930 \$MN_INDEX_AX_POS_TAB_2 (indexing position table 2)

MD30300 \$MA_IS_ROT_AX (rotary axis)

MD30310 \$MA_ROT_IS_MODULO (modulo conversion for rotary axis)

2.3 NC machine data

10930	INDEX_AX_POS_TAB_2			N09	T1	
mm/inch, degrees	Indexing position table 2			DOUBLE	Reset	
-						
-	60	0., 0., 0., 0., 0., 0., 0., 0....	-MD_DBLMAX	1.0E+301	7/2	M

Description:

The indexing position table is used to assign the axis positions in the valid unit of measurement (mm, inches or degrees) to the indexing positions [n] on the indexing axis.
[n] = indexing for the entry of the indexing positions in the indexing position table.

Range: 0 y n x 59, where 0 corresponds to the 1st indexing position and 59 to the 60th indexing position.

Note:

Programming with the absolute indexing position (e.g. CAC) starts with indexing position 1. This corresponds to the indexing position with indexing n = 0 in the table.

The following should be noted when entering the indexing positions:

- Up to 60 different indexing positions can be stored in the table.
- The 1st entry in the table corresponds to indexing position 1; the nth entry corresponds to indexing position n.
- The indexing positions should be entered in the table in ascending order (starting with the negative and going to the positive traversing range) with no gaps between the entries. Consecutive position values must not be identical.
- If the indexing axis is defined as a rotary axis (MD30300 \$MA_IS_ROT_AX = "1") with modulo 360° (MD30310 \$MA_ROT_IS_MODULO = "1"), then the position values are limited to a range of 0° x pos. < 360°.

The number of indexing positions used in the table is defined by MD10920 \$MN_INDEX_AX_LENGTH_POS_TAB_2.

Entering the value 1 in axial MD30500 \$MA_INDEX_AX_ASSIGN_POS_TAB assigns indexing position table 1 to the current axis.

Special cases:

Alarm 17020 "Illegal array index" if over 60 positions are entered in the table.

Related to:

MD30500 \$MA_INDEX_AX_ASSIGN_POS_TAB (axis is an indexing axis)

MD10920 \$MN_INDEX_AX_LENGTH_POS_TAB_2 (num ber of indexing positions used in table 2)

MD30300 \$MA_IS_ROT_AX(rotary axis)

MD30310 \$MA_ROT_IS_MODULO (modulo conversion for rotary axis)

10940	INDEX_AX_MODE			EXP	T1	
-	Settings for indexing position			UDWORD	PowerOn	
-						
-	-	0	0	0x1	7/2	M

Description:

Affects the display of indexing positions (AA_ACT_INDEX_AX_POS_NO and aaActIndexAxPosNo).

Bit 0 = 0:

Indexing position display changes on reaching/passing the indexing position (indexing range lies between the indexing positions, compatible behavior).

Bit 0 = 1:

Indexing position display changes on passing the half indexing axis position (indexing range lies quasi symmetrically round the indexing position)

11100	AUXFU_MAXNUM_GROUP_ASSIGN			N01, N07, N02	H2	
-	Number of auxiliary functions distr. amongst aux. fct. groups			DWORD	PowerOn	
-						
-	-	1	1	255	7/2	M

Description: The maximum number of auxiliary functions that can be assigned to a group by
AUXFU_ASSIGN_TYPE,
AUXFU_ASSIGN_EXTENTION,
AUXFU_ASSIGN_VALUE and
AUXFU_ASSIGN_GROUP.
This number includes only the user-defined auxiliary functions, not the predefined
auxiliary functions.
Related to:
MD22010 \$MC_AUXFU_ASSIGN_TYPE[n].

11110	AUXFU_GROUP_SPEC			N07	H2	
-	Auxiliary function group specification			UDWORD	PowerOn	
-						
-	168	0x81, 0x21, 0x41, 0x41, 0x41, 0x41, 0x41, 0x41...	0	0x7FFFFFFF	7/2	M

Description: Defines the output options for the auxiliary functions belonging to a group.
However, the output option of an auxiliary function configured by MD22080
\$MC_AUXFU_PREDEF_SPEC[preIndex] or MD22035 \$MC_AUXFU_ASSIGN_SPEC[auxIndex] has a
higher priority.

Bit 0=1 "Normal" acknowledgment after an OB1 cycle
Bit 1=1 "Quick" acknowledgment with OB40
Bit 2=1 No predefined auxiliary function
Bit 3=1 No output to PLC
Bit 4=1 Spindle response after acknowledgment by the PLC
Bit 5=1 Output prior to motion
Bit 6=1 Output during motion
Bit 7=1 Output at end of block
Bit 8=1 No output after block search types 1, 2, 4
Bit 9=1 Collection during block search type 5 (SERUPRO)
Bit 10 = 1 No output during block search type 5 (SERUPRO)
Bit 11 = 1 Cross-channel auxiliary function during block search type 5 (SERUPRO)
Bit 12 = 1 Output via synchronized action
Bit 13 = 1 Implicit auxiliary function
Bit 14 = 1 Active M01
Bit 15 = 1 No output during running-in test
Bit 16 = 1 Nibbling off
Bit 17 = 1 Nibbling on
Bit 18 = 1 Nibbling

The MD must be defined for each existing auxiliary function group.
The index [n] corresponds to the auxiliary function group index: 0...63
The assignment of individual auxiliary functions to specific groups is defined in
channel-specific machine data (AUXFU_PREDEF_TYPE, AUXFU_PREDEF_EXTENTION,
AUXFU_PREDEF_VALUE, AUXFU_PREDEF_GROUP, AUXFU_ASSIGN_TYPE, AUXFU_ASSIGN_EXTENTION,
AUXFU_ASSIGN_VALUE, AUXFU_ASSIGN_GROUP).
M0, M1, M2, M17 and M30 are assigned to group 1 by default.

2.3 NC machine data

The specification of this group (0x81: output duration 1 OB1 pass, output at end of block) must not be changed.

All spindle-specific auxiliary functions (M3, M4, M5, M19, M70) are assigned to group 2 by default.

If several auxiliary functions with different output types (before / during / at end of motion) are programmed in one motion block, then the output of the individual auxiliary functions corresponds to their output types.

All auxiliary functions are output simultaneously in a block without motion.

Default setting:

AUXFU_GROUP_SPEC[0]=81H

AUXFU_GROUP_SPEC[1]=21H

AUXFU_GROUP_SPEC[2]=41H

...

AUXFU_GROUP_SPEC[n]=41H

11120	LUD_EXTENDED_SCOPE			N01	PG	
-	Function "program global user data (PUD)" is active			BOOLEAN	PowerOn	
-						
-	-	FALSE	0	-	7/2	M

Description:

Activate function "Program-global user data (PUD)":

MD = 0: User data of the main program level are only active on this level.

MD = 1: User data of the main program level are also visible in the subprogram levels.

11140	GUD_AREA_SAVE_TAB			N01	-	
-	Additional saving for GUD modules			UDWORD	Immediately	
-

11160	ACCESS_EXEC_CST			N01	-	
-	Execution right for /_N_CST_DIR			BYTE	PowerOn	
-						
-	-	7	1	7	7/2	M

Description:

Execution right assigned to the program stored in directory /_N_CST_DIR :

Value 1: Machine OEM password

Value 2: Password of setup engineer, service

Value 3: End user password

Value 4: Keyswitch position 3

Value 5: Keyswitch position 2

Value 6: Keyswitch position 1

Value 7: Keyswitch position 0

Machine data can only be written with value 1 if the password for machine OEM is also active.

11161	ACCESS_EXEC_CMA	N01	-
-	Execution right for /_N_CMA_DIR	BYTE	PowerOn
-			
-	-	7	1
-	-	7	7/2
-	-	-	M

Description:

Execution right assigned to the programs stored in directory /_N_CMA_DIR :

Value 1: Machine OEM password

Value 2: Password of setup engineer, service

Value 3: End user password

Value 4: Keyswitch position 3

Value 5: Keyswitch position 2

Value 6: Keyswitch position 1

Value 7: Keyswitch position 0

Machine data can only be written with value 1 if the password for machine OEM is also active.

11162	ACCESS_EXEC_CUS	N01	-
-	Execution right for /_N_CUS_DIR	BYTE	PowerOn
-			
-	-	7	1
-	-	7	7/3
-	-	-	U

Description:

Execution right assigned to the programs stored in directory /_N_CUS_DIR :

Value 1: Machine OEM password

Value 2: Password of setup engineer, service

Value 3: End user password

Value 4: Keyswitch position 3

Value 5: Keyswitch position 2

Value 6: Keyswitch position 1

Value 7: Keyswitch position 0

Machine data can only be written with values 1 or 2 if the password for machine OEM or commissioning/service is also active.

11165	ACCESS_WRITE_CST	N01	-
-	Write protection for directory /_N_CST_DIR	DWORD	PowerOn
-			
-	-	-1	-1
-	-	7	7/2
-	-	-	M

Description:

Set write protection for cycle directory /_N_CST_DIR:

Assigned to the programs:

Value -1: Keep the value currently set

Value 1: Machine OEM password

Value 2: Password of setup engineer, service

Value 3: End user password

Value 4: Keyswitch position 3

Value 5: Keyswitch position 2

Value 6: Keyswitch position 1

2.3 NC machine data

Value 7: Keyswitch position 0

The machine data can only be written with value 1 if the password for machine OEM is also active. The value 0 is not permissible.

11166	ACCESS_WRITE_CMA	N01	-
-	Write protection for directory /_N_CMA_DIR	DWORD	PowerOn
-			
-	-	-1	-1
		7	7/2
			M

Description:

Set write protection for cycle directory /_N_CMA_DIR:

Assigned to the programs:

Value -1: Keep the value currently set

Value 1: Machine OEM password

Value 2: Password of setup engineer, service

Value 3: End user password

Value 4: Keyswitch position 3

Value 5: Keyswitch position 2

Value 6: Keyswitch position 1

Value 7: Keyswitch position 0

The machine data can only be written with value 1 if the password for machine OEM is also active. The value 0 is not permissible.

11167	ACCESS_WRITE_CUS	N01	-
-	Write protection for directory /_N_CUS_DIR	DWORD	PowerOn
-			
-	-	-1	-1
		7	7/3
			U

Description:

Set write protection for cycle directory /_N_CUS_DIR:

Assigned to the programs:

Value -1: Keep the value currently set

Value 1: Machine OEM password

Value 2: Password of setup engineer, service

Value 3: End user password

Value 4: Keyswitch position 3

Value 5: Keyswitch position 2

Value 6: Keyswitch position 1

Value 7: Keyswitch position 0

The machine data can only be written with values 1 or 2 if the password for machine OEM or commissioning/service is also active. The value 0 is not permissible.

11170	ACCESS_WRITE_SACCESS	N01	-
-	Write protection for _N_SACCESS_DEF	BYTE	PowerOn
-			
-	-	7	1
		7	7/2
			M

Description:

Set write protection for definition file /_N_DEF_DIR/_N_SACCESS_DEF:

Value 1: Machine OEM password

Value 2: Password of setup engineer, service

Value 3: End user password

Value 4: Keyswitch position 3

Value 5: Keyswitch position 2

Value 6: Keyswitch position 1

Value 7: Keyswitch position 0

The machine data can only be written with value 1 if the corresponding password for machine OEM is also active.

11171	ACCESS_WRITE_MACCESS			N01	-	
-	Write protection for _N_MACCESS_DEF			BYTE	PowerOn	
-						
-	-	7	1	7	7/2	M

Description:

Set write protection for definition file /_N_DEF_DIR/_N_MACCESS_DEF:

Value 1: Machine OEM password

Value 2: Password of setup engineer, service

Value 3: End user password

Value 4: Keyswitch position 3

Value 5: Keyswitch position 2

Value 6: Keyswitch position 1

Value 7: Keyswitch position 0

The machine data can only be written with value 1 if the password for machine OEM is also active.

11172	ACCESS_WRITE_UACCESS			N01	-	
-	Write protection for _N_UACCESS_DEF			BYTE	PowerOn	
-						
-	-	7	1	7	7/3	U

Description:

Set write protection for definition file /_N_DEF_DIR/_N_UACCESS_DEF:

Value 1: Machine OEM password

Value 2: Password of setup engineer, service

Value 3: End user password

Value 4: Keyswitch position 3

Value 5: Keyswitch position 2

Value 6: Keyswitch position 1

Value 7: Keyswitch position 0

The machine data can only be written with values 1 or 2 if the machine OEM or commissioning/service password is also active.

11200	INIT_MD			EXP, N01	IAF, IA	
-	Standard machine data loaded at next Power On			UBYTE	PowerOn	
-						
-	-	0	0	0x3f	7/2	M

Description:

A power on must be triggered after setting MD11200 \$MN_INIT_MD. The function is executed and the MD reset to "0" at power on.

Meaning of the input:

Bit 0 set:

All machine data (with the exception of the memory-configuring data) will be overwritten with the compiled values at the next NCK power on.

Bit 1 set:

All memory-configuring machine data will be overwritten with the compiled values at the next NCK power on.

Bit 2 set:

The OEM machine data and the SIEMENS cycle machine data brought in by compile cycles will be deleted from the buffered memory at the next power on.

2.3 NC machine data

Bit 3 set:

All setting data will be overwritten with the compiled values at the next power on.

Bit 4 set:

All option data will be overwritten with the compiled values at the next power on.

Bit 5 set:

The passive file system (including PowerFail log file) will be deleted at the next power on of the NCK.

INIT_MD is automatically set to 0 at power on.

Memory configuring MDs are:

- MD10010 \$MN_ASSIGN_CHAN TO MODE_GROUP
- All machine data starting with "MM_"
 - MD 18000 - 18999 (general MD)
 - MD 28000 - 28999 (channel-specific MD)
 - MD 38000 - 38999 (axis-specific MD)

11202	MD_MODE_MASK			EXP, N01	IA	
-	Behavior of machine data changes			UBYTE	PowerOn	
-						
-	-	0	0	-	7/2	M

Description:

Behavior of machine data changes

Bit 0 (LSB): When configuring linear/rotary axes, do not load initial values for axis type-dependent MDs

Due to the existence of one plausible default value each for a linear axis or rotary axis, axial machine data can facilitate setup for the user. With the switchover process (Lin -> Rot, or Rot -> Lin), the respectively configured default values become active as actual values at the next warm restart of the controller.

11210	UPLOAD_MD_CHANGES_ONLY			N01, N05	-	
-	Machine data backup of changed machine data only			UBYTE	Immediately	
-						
-	-	0xFF	0	-	7/3	M

Description:

Either all data or only those data which differ from the default setting can be set to be output when creating standard archives (ARC) and copying 'NC active data'.

Bit0(LSB) Effectiveness of the differential upload with INI/TEA files

0: All data are output

1: Only those MDs that have changed in comparison to the compiled values are output

Bit1 is reserved and acts like bit 0

Bit2 Change to an array element

0: Complete arrays are output

1: Only those elements of an array that have changed are output

Bit3 R variables (only for INI files)

0: All R variables are output

1: Only R variables not equal to '0' are output

Bit4 Frames (only for INI files)

0: All frames are output

1: Only those frames that are not zero frames are output.

Bit5 Tool data (cutting edge parameters) (only for INI files)

0: All tool data are output

1: Only those tool data not equal to '0' are output.

Bit6 Buffered system variables (\$AC_MARKER[], \$AC_PARAM[] only for INI files)

0: All system variables are output

1: Only those system variables not equal to '0' are output

Bit7 Synchronized actions GUD (for INI files only)

0: All Syna GUD are output

1: Only those Syna GUD not equal to '0' are output

Active: The change in the data becomes active on the start of the upload for the next range.

The settings are only active, if MD11212 \$MN_UPLOAD_CHANGES_ONLY=FALSE.

11212	UPLOAD_CHANGES_ONLY	N01, N05	-
-	Data backup type for an active file system.	BOOLEAN	Immediately
-			
-	-	TRUE	-
-	-	-	7/3
-	-	-	M

Description:

For the creation of standard archives (ARC) and copying 'NC-active data', only values of the selected file of the active file system that deviate from the default setting are backed up.

TRUE = only the values of the selected file of the active file system that deviate from the standard setting are backed up (a differential data backup)

The value of MD11210 \$MN_UPLOAD_MD_CHANGES_ONLY then has no effect.

FALSE = all values of the selected file of the active file system are backed up.

Same significance as MD11210 \$MN_UPLOAD_MD_CHANGES_ONLY=0.

However, if MD11210 \$MN_UPLOAD_MD_CHANGES_ONLY is not equal to 0, this setting is active.

11220	INI_FILE_MODE	N01, N05	G2
-	Error response to INI file errors	BYTE	Reset
-			
-	-	1	0
-	-	2	7/2
-	-	-	M

Description:

If, while reading machine data files (INI files) into controls, data are read in

- that are faulty or
- do not agree with the check sum

then alarms are generated and the reading in may be canceled. The following control behaviors can be selected via machine data

settings:

0: Output of an alarm, cancelation on detection of 1st error. (As SW versions 1 and 2).

1: Output of an alarm, continuation of execution. An alarm with the number of errors is output at the end of execution.

2: Execution continues despite possible errors. An alarm with the number of errors is output at the end of execution.

11230	MD_FILE_STYLE	N01, N05	-
-	Structure of machine data backup files	UBYTE	Immediately
LINK, -			
-	-	0x3	0
-	-	-	7/3
-	-	-	M

Description:

Appearance of a machine data file at 'upload'

Bit 0 (LSB): Line check sum is generated

Bit 1:

MD numbers are generated

Bit 2:

Channel axis name as field index with axis-MD in the TEA file

Bit 3:

With an NCU-link, the MDs of the LINK axes are also output.

2.3 NC machine data

Bit 4:

All local axes are output (even when they are not activated by MD20070 \$MC_AXCONF_MACHAX_USED)

Active:

The change in the data becomes active on the start of the upload for the next area.

Default setting:

The line check sums and MD numbers are generated, but not channel names as field index with axis-MD.

11250	PROFIBUS_SHUTDOWN_TYPE			EXP, N01	G3, FBU	
-	PROFIBUS/PROFINET shutdown handling			BYTE	PowerOn	
-						
-	-	0	0	2	7/2	M

Description:

For PROFIBUS/PROFINET only:

Handling of PROFIBUS/PROFINET when shutting down NCK (NCK reset)

Value 0:

The bus is shut down directly from cyclic operation, without 'prewarning'

Value 1:

When shutting down NCK, the bus is changed to the CLEAR state for at least 20 cycles. Then, it is shut down. If this is not possible on the hardware side, the procedure described for value 2 is used instead.

Value 2:

When shutting down NCK, the bus is changed to a state where all drives are sent a zero word as control word1 and control word2 (pseudoclear) for at least 20 cycles. The bus itself remains in the Operate status.

11280	WPD_INI_MODE			N01	-	
-	Handling of INI files in workpiece directory			BYTE	PowerOn	
-						
-	-	0	0	1	7/2	M

Description:

Processing mode of INI files in the workpiece directory:

Value = 0:

An INI file with the name of the workpiece and stored in the workpiece directory is executed on the first NC start after workpiece selection.

Value = 1:

INI files with the names of the selected part program and extensions are executed on the first NC start after workpiece selection

Trace of warm start and connection cancelation in `_N_SIEMDOMAINSEQ_MPF`

Bit4:
Additional information about the PDUs sent will be entered in `_N_SIEMDOMAINSEQ_MPF` during upload

Bit5:
Additional information about the PDUs received will be entered in `_N_SIEMDOMAINSEQ_MPF` during upload

11297	PROTOK_IPOCYCLE_CONTROL			N01	-	
-	Prevent overrun of IPO time level			BYTE	PowerOn	
-						
-	10	1, 1, 1, 1, 1, 1, 1...	0	1	1/1	M

Description: Setting whether an overflow of the time level is to be prevented during the recording of data in the time level of the IPO.

If applicable, data sets are discarded when the function is active, and are not entered in the log file in order to prevent an impending overflow of the IPO time level.

This may mean that data sets are also then lost if a level overflow would not yet have occurred with the function inactive.

The individual values apply to the users of the logging function, which are assigned the following functions:

- 0: Reserved for system functions: simultaneous recording, simulation, synchronized action analysis
- 1: Reserved for system functions: determining program runtimes, multi-step editor
- 2: Reserved for OEM applications
- 3: Reserved for OEM applications
- 4: Reserved for OEM applications
- 5: Reserved for system functions: trace
- 6: Reserved for system functions: trace
- 7: Reserved for system functions: trace
- 8: Reserved for system functions: trace
- 9: Reserved for system functions: action log

2.3 NC machine data

11298	PROTOK_PREPTIME_CONTROL			N01	-	
-	Interruption time prep time level in seconds.			DOUBLE	PowerOn	
-						
-	10	1.0, 1.0, 1.0, 1.0, 1.0, 1.0, 1.0, 1.0...	-MD_DBLMAX	1.0E+301	1/1	M

Description:

Time in seconds, for which the prep time level may be blocked. If the PREP does not manage to pass through within the set time, the cyclic events are not logged. It is thus ensured that operation cannot be completely blocked by data recording.

The individual values apply to the users of the logging function, which are assigned the following functions:

0: Reserved for system functions: simultaneous recording, simulation, synchronized action analysis

1: Reserved for system functions: determining program runtimes, multi-step editor

11300	JOG_INC_MODE_LEVELTRIGGRD			N01	H1, R1	
-	INC and REF in jog mode			BOOLEAN	PowerOn	
-						
-	-	TRUE	0	-	7/2	M

Description:

1: Jog mode for JOG-INC and reference point approach

JOG-INC:

When the traversing key is pressed in the required direction (e.g. +), the axis begins to traverse the set increment. If the key is released before the increment has been completely traversed, the movement is interrupted and the axis stops. If the same key is pressed again, the axis completes the remaining distance-to-go until this is 0.

0: Continuous operation for JOG-INC and reference point approach

JOG-INC:

When the traversing key is pressed (first rising edge) the axis travels the whole set increment. If the same key is pressed again (second rising edge) before the axis has completed traversing the increment, the movement is canceled, i.e. not completed.

The differences in axis travel behavior between the jog mode and continuous operation in incremental traversing are described in detail in the relevant chapters.

For travel behavior in reference point approach see

References: /FB/, R1, "Reference Point Approach"

MD irrelevant for:

Continuous traversing (JOG continuous)

11310	HANDWH_REVERSE			N09	H1	
-	Threshold for direction change handwheel			BYTE	PowerOn	
-						
-	-	2	0	-	7/2	M

Description:

Handwheel travel:

Value = 0:

No immediate travel in the opposite direction

Value > 0:

Immediate travel in the opposite direction if the handwheel is turned at least the stated number of pulses in the opposite direction.

Whether this machine data is also active for handwheel travel with DRF depends on bit10 of MD20624 \$MC_HANDWH_CHAN_STOP_COND.

11320	HANDWH_IMP_PER_LATCH				N09	H1	
-	Handwheel pulses per detent position				DOUBLE	PowerOn	
-							
-	6	1., 1., 1., 1., 1., 1.	-MD_DBLMAX	1.0E+301	7/2	M	

Description:

The connected handwheels are adapted to the control in MD11320

\$MN_HANDWH_IMP_PER_LATCH.

The number of pulses generated by the handwheel for each handwheel detent position has to be entered. The handwheel pulse weighting must be defined separately for each connected handwheel (1 to 3). With this adaptation, each handwheel detent position has the same effect as one press of the traversing key in incremental traversal.

Entering a negative value reverses the direction of rotation of the handwheel.

Related to:

MD31090 \$MA_JOG_INCR_WEIGHT

(weighting of an increment of a machine axis for
INC/manual).

11322	CONTOURHANDWH_IMP_PER_LATCH			N09	H1	
-	Contour handwheel pulses per detent position			DOUBLE	PowerOn	
-						
-	6	1., 1., 1., 1., 1., 1.	-MD_DBLMAX	1.0E+301	7/2	M

Description:

Adaptation factor to the hardware of the contour handwheel:

Enter the number of pulses issued per detent position by the contour handwheel.

Because of this normalization, a detent position of the contour handwheel corresponds to one press of a key with incremental jog processes.

Sign reversal reverses the direction of evaluation.

11324	HANDWH_VDI_REPRESENTATION				N01	OEM	
-	Display of handwheel number in VDI Interface				DWORD	PowerOn	
-							
-	-	0	0	1	7/2	M	

Description:

The number of the handwheel is displayed in the channel/axis-specific signals of the VDI interface:

Value = 0 :

Bit coded (1 of 3, only 3 handwheels can be displayed)

Value = 1 :

Binary coded (6 handwheels can be displayed)

11330	JOG_INCR_SIZE_TAB			EXP, N09	H1	
-	Increment size for INC/handwheel			DOUBLE	PowerOn	
-						
-	5	1., 10., 100., 1000., 10000.	0.0	1.0E+301	7/2	M

2.3 NC machine data

Description: In incremental traversal or handwheel travel, the number of increments to be traversed by the axis can be defined by the user, e.g. via the machine control panel.

In addition to the variable increment size (INCvar), 5 fixed increment sizes (INC...) can also be set.

The increment size for each of these 5 fixed increments is defined collectively for all axes by entering values in JOG_INCR_SIZE_TAB [n]. The default setting is INC1, INC10, INC100, INC1000 and INC10000.

The entered increment sizes are also active for DRF.

The size of the variable increment is defined in SD41010 \$SN_JOG_VAR_INCR_SIZE.

Related to:

MD31090 \$MA_JOG_INCR_WEIGHT (weighting of an increment for INC/manual)
 NC/PLC interface signal DB21-30 DBX41.0-.4, DBX47.0-.4, DBX53.0-.4
 (Geometry axis 1-3 active machine function: INC1; ...; INC10000)
 NC/PLC interface signal DB31, ... DBB65.0 - .5
 (active machine function: INC1; ...; INC10000).

11342	ENC_HANDWHEEL_MODULE_NR			N01	H1	
-	3rd handwheel: drive number / measuring circuit number			BYTE	PowerOn	
-						
-	-	0	0	31	7/2	M

Description: Only for test purposes for PROFIBUS/PROFINET:
 Number of the module within a segment (MD11340 \$MN_ENC_HANDWHEEL_SEGMENT_NR), used to address the 3rd handwheel.

= 0: The configuration of a 3rd handwheel is deactivated, in this case the setting of MD11340 \$MN_ENC_HANDWHEEL_SEGMENT_NR and MD11344 \$MN_ENC_HANDWHEEL_INPUT_NR are irrelevant.

Corresponds with MD11340 \$MN_ENC_HANDWHEEL_SEGMENT_NR
 MD11344 \$MN_ENC_HANDWHEEL_INPUT_NR

11344	ENC_HANDWHEEL_INPUT_NR			N01	H1	
-	3rd handwheel: Input to module/meas. circ. Board			BYTE	PowerOn	
-						
-	-	1	1	2	7/2	M

Description: Only for test purposes for PROFIBUS/PROFINET:
 Number of the input on a module used to address the 3rd handwheel.

840D: 1/2 = upper/lower actual value input

Corresponds with MD11340 \$MN_ENC_HANDWHEEL_SEGMENT_NR
 MD11342 \$MN_ENC_HANDWHEEL_MODULE_NR

11346	HANDWH_TRUE_DISTANCE			N01	H1, P1, W1	
-	Handwheel default path or velocity			BYTE	PowerOn	
-						
-	-	1	0	7	7/2	M

Description: Setting the behavior for traversing with the handwheel, contour handwheel and with FDA=0:

Value = 1: (default value)

The default settings of the handwheel are path inputs. No pulses are lost. Residual axis motions occur as a result of the limitation to a maximal permissible velocity.

Value = 0:

The default settings of the handwheel are velocity inputs. The axes stop as soon as the handwheel stops. The motion is immediately braked if no pulses come from the handwheel in an interpolation cycle. Therefore, only a short residual motion of the axes can occur as a result of the braking ramp. The handwheel pulses do not supply a path default.

Value = 2:

The default settings of the handwheel are velocity inputs. The axes are intended to stop as soon as the handwheel stops. The motion is immediately braked if no pulses come from the handwheel in an interpolation cycle. However, in contrast to value = 0, braking is not along the shortest possible path but to the next possible point in an intended grid.

Each increment in the grid corresponds to a distance which the selected axis travels per handwheel grid position (see MD31090 \$MA_JOG_INCR_WEIGHT and

see MD31090 \$MA_JOG_INCR_WEIGHT and,
MD11330 \$MN_JOG_INCR_SIZE_TAB,
MD20620 \$MC_HANDWH_GEOAX_MAX_INCR_SIZE).

MD32080 \$MA_HANDWH_MAX_INCR_SIZE

The start of the traversing movement is taken as the zero point of the grid.

Value = 3:

The default settings of the handwheel are path inputs. If premature braking is required on account of settings in other machine data

MD11310 \$MN_HANDWH_REVERSE != 0

MD20624 \$MC_HANDWH_CHAN_STOP_COND

MD32084 \$MA_HANDWH_STOP_COND

then in contrast to value = 1 braking is not along the shortest possible path, but to the next possible point in an intentional grid (see value = 2).

Value = 6:

Same as value = 2, but travel does not stop at the last possible grid position in front of a limit, but at the limit.

Value = 7:

Same as value = 3, but travel does not stop at the last possible grid position in front of a limit, but at the limit.

11350	HANDWHEEL_SEGMENT			N09	H1	
-	Handwheel segment			DWORD	PowerOn	
-						
-	6	0, 0, 0, 0, 0, 0	0	255	7/2	M

Description:

Machine data defines which

hardware segment the handwheel is connected to:

0 = No handwheel

5 = Connection to PB/PN-connected operator component (MCP PN, etc.)

7 = Direct connection via IE-connected operator component (MCP IE, HTx)

11351	HANDWHEEL_MODULE			N09	H1	
-	Handwheel module			BYTE	PowerOn	
-						
-	6	0, 0, 0, 0, 0, 0	0	6	7/2	M

Description:

Machine data specifies the hardware module to which the handwheel is connected.

(Content dependent on MD11350 \$MN_HANDWHEEL_SEGMENT):

0 = no handwheel configured

MD11351 \$MN_HANDWHEEL_MODUL =

2.3 NC machine data

```

1      ;SEGMENT_840D_HW
1      ;SEGMENT_8xxD_HW; 828D s1, 808D -HW
1..6  ;SEGMENT_PROFIBUS/PROFINET ;index for MD11353
$MN_HANDWHEEL_LOGIC_ADDRESS[(x-1)]
1      ;SEGMENT_ETHERNET

```

11352	HANDWHEEL_INPUT	N09	H1
-	Handwheel connection	BYTE	PowerOn
-			
-	6	0, 0, 0, 0, 0, 0	0

Description: Machine data which is intended to select the handwheels connected to a hardware module:

- 0 = No handwheel configured
- 1..6 = Handwheel connection to HW module/Ethernet interface

11353	HANDWHEEL_LOGIC_ADDRESS	N04, N10	H1
-	Logical handwheel slot addresses	DWORD	PowerOn
-			
-	6	0, 0, 0, 0, 0, 0	0

Description: For PROFIBUS/PROFINET only:
Logical start address of the hand wheel slots if handwheels are connected by PROFIBUS/PROFINET (MD11340 \$MN_HANDWHEEL_SEGMENT = 5)

11354	HANDWHEEL_FILTER_TIME	N09	-
s	Filter time for handwheel pulses	DOUBLE	PowerOn
-			
-	6	0.0, 0.0, 0.0, 0.0, 0.0, 0.0	0.0

Description: The filter time indicates the time during which the pulses from the handwheel are output to the interpolator. The values are incremented internally in interpolation cycles.

In the case of a filter time setting = 0.0, the pulses from the handwheel are output to the interpolator within a single interpolation cycle. This can cause the controlled axis to exhibit jerk during traversing.

Machine data is valid for the following types of handwheel (see 11350 \$MN_HANDWHEEL_SEGMENT):

SEGMENT_ETHERNET:

- Recommended filter time: 0.2 - 0.5 s

11398	AXIS_VAR_SERVER_SENSITIVE	EXP	B3
-	Axis-Var server response	UBYTE	PowerOn
-			
-	-	0	0

Description: The axis-variable server supplies the data for the OPI blocks SMA/SEMA, SGA/SEGA and SSP.

If no value can be supplied for an axis (e.g. because the axis is a link axis) then a default value (usually 0) is returned.

For debugging purposes, this machine data can be used to set the axis-var-server to sensitive so that an error message is returned instead of a default value.

0: default value

1: error message

11410	SUPPRESS_ALARM_MASK	EXP, N06	D1, M3, K3, S1, V1, W1
-	Mask for support of special alarm outputs	UDWORD	PowerOn

			M

Description:

Mask for suppressing special alarm outputs

Bit set: The corresponding alarm (warning) is NOT triggered.

Bit 0:

Alarm 15110 "Channel %1 block %2 REORG not possible"

Bit 1:

Alarm 10763 "Channel %1 block %2. The path component of the block in the contour plane is zero"

Bit 2:

Alarm 16924 "Channel %1 Caution: Program testing can modify tool/magazine data"

--> Note: The alarm is only a message alarm

Bit 3:

Alarm 22010 "Channel %1 spindle %2 block %3. Actual gear stage does not correspond to set gear stage"

Bit 4:

Alarm 17188 "Channel %1 D number %2 with tool T nos. %3 and %4 defined"

Alarm 17189 "Channel %1 D number %2 of the tools in magazines/magazine locations %3 and %4 defined". The two alarms are of equal status and are only message alarms.

Bit 5:

Alarm 22071 "TO unit %1 tool %2 duplo no. %3 is active but not in the active wear grouping." The alarm is only a message alarm.

Bit 6:

Alarm 4027 "NOTICE! MD %1 was also changed for the other axes in the axis container %2"

Alarm 4028 "NOTICE! The axial MDs in the axis container will be aligned on the next runup "

Bit 7:

Alarm 22070 "TO unit %1 please change tool T= %2 to magazine. Repeat data backup". The alarm is only a message alarm.

Bit 8:

Alarm 6411 "Channel %1 tool %2 with duplo no. %3 has reached tool prewarning limit"

Alarm 6413 "Channel %1 tool %2 with duplo no. %3 has reached tool monitoring limit."

The two alarms are only message alarms. They occur during program execution.

Bit 9:

Alarm 6410 "TO unit %1 tool %2 with duplo no. %3 has reached tool prewarning limit ."

Alarm 6412 "TO unit %1 tool %2 with duplo no. %3 has reached tool monitoring limit ".

The two alarms are only message alarms. They occur as a result of an operator action.

Bit10:

Alarm 10604 "channel %1 block %2 "Thread lead increase too high"

Alarm 10605 "channel %1 block %2 "Thread lead decrease too high"

Bit 11:

Alarm 14088 "Channel 51 block %2 axis %3 doubtful position".

Bit 12:

obsolete (Alarm 10607)"

Bit13:

2.3 NC machine data

Alarm 10704 " channel %1 block %2 Protection area monitoring is not
guaranteed."

Bit14:
Alarm 21701 "Measuring reactivated too soon (<2 IPO cycles)"

Bit15:
Alarm 5000 "Communication order cannot be executed"

Bit16:
Alarm 21600 "Monitoring active for ESR"

Bit17:
Alarm 16945 "Channel %1 action %2<ALNX> is delayed until block end"
Note: The alarm is only a message alarm.

Bit18:
Alarm 10750 "Channel %1 block %2 Activation of the tool radius compensation without
tool number"

Bit19: Alarm 17193 "Channel %1 block %2 The active tool ist no longer at tool
holder no./spindle no. %3, program %4"

Bit20:
Alarm 2900 "Reboot is delayed"

Bit21:
Alarm 22012 "Channel %1 block %2. Leading axis %3 is in simulation mode"
Alarm 22013 "Channel %1 block %2. Following axis %3 is in simulation mode"
Alarm 22014 "Channel %1 block %2. The dynamics of leading axis %3 and following axis
%4 are very different"
Alarm 22040 "Channel%1 Block %3 Spindle %2 not referenced with zero mark" is no longer
checked (cyclically) with
Bit21 set after power ON of the closed loop position control.

Bit22:
Alarm 26080 "Channel %1 retraction position of axis %2 not programmed or invalid"
Alarm 26081 "Channel %1 single axis trigger axis %2 is triggered, but axis is not PLC
controlled"

Bit23:
Alarm 16949 "Correspondence between marks of channel %1 and channel %2
is invalid"

Bit24:
Alarm 16950 "Channel %1 search run with holding block"

Bit25:
Alarm 22016 "Channel %1 block %2 following spindle %3 in range of reduced acceleration
capacity"

-	Activation of warnings	UDWORD	Reset
-			
-	-	0x0	0
		0x7FFFFFFF	7/2
			M

Description:

Mask for generating alarms that are normally suppressed.

Bit set: Alarms of this alarm group are output.

Bit not set: Alarms of this alarm group are not output.

Bit Hex. Meaning
value

=====

0: 0x1 Alarms that have SHOWALARMAUTO as the alarm response are output.

1: 0x2 Alarms that have SHOWWARNING as the alarm response are output.

2: 0x4 Alarm 22280 "Thread power up path too short" is output.

3: 0x8 Alarms that are triggered by the NCU LINK MODULE are switched on.

4: 0x10 Alarm 10883 "Chamfer or rounding must be shortened" allowed.

5: 0x20 Alarm 20096 "Brake test canceled" is output.

6: 0x40 Alarm 16956 "Program cannot be started because of global start disable" is output.

Alarm14005 "Program cannot be started because of program-specific start disable" is output. Alarm can only be switched on in channel status RESET, in all other channel states it is output without conditions.

7: 0x80 Alarm 16957 "Stop delay range is suppressed" is output.

8: 0x100 Alarm 1011 fine coding150019 or 150020 "Incorrect axis number in the LINK".

9: 0x200 Alarm 22033 Diagnostics 1 to 6 for "Track synchronism" (linkages).

10: 0x400 Alarm 15122 "PowerOn after Powerfail: %1 data were restored, thereof %2 machine data, %3 errors" is output.

11: 0x800 Alarms 10722, 10723, 10732 or 10733 are output instead of alarms 10720, 10721, 10730 or 10731.

12: 0x1000 Alarm 22033 diagnostics greater than or equal to 7 for "Track synchronism" (linkages)

13: 0x2000 All alarms that refer to the rejection of an ASUB start are also output.

14: 0x4000 All alarms that refer to the rejection of a PI service are also output.

15: 0x8000 Alarm 14004 "channel-specific start disable is set" is output on an NC start. The alarm always appears with block search, irrespective of bit 15.

11412	ALARM_REACTION_CHAN_NOREADY	EXP, N01	D1
-	Alarm response CHAN_NOREADY permitted	BOOLEAN	PowerOn
-			
-	-	FALSE	0
		-	7/2
			M

Description:

This MD is used for compatibility with the PLC systems older than SW4.1.

If this MD is not set, the behavior implemented before SW4.1 (configured alarm reaction) is set

With SW 4.1 and higher, it is possible to set signal CHANNEL_NOREADY on the PLC in response to alarms.

If this MD is not set, then the alarm handler internally re-configures BAG_NOREADY into CHAN_NOREADY.

2.3 NC machine data

11414	ALARM_CLR_NCSTART_W_CANCEL	EXP, N01	D1
-	Clear NCSTART alarms with CANCEL	BOOLEAN	PowerOn
-			
-	-	FALSE	0

Description: If this MD is set, then alarms that have ClearInfo=NCSTART are cleared by the Alarm Cancel button as well as by NC-Start.
 If this MD is not set, then NCSTART alarms are not cleared by Cancel.
 The purpose of this MD is to provide compatibility with system behavior.

2.3 NC machine data

11416	LINK_DYNMSG_ALARM_MASK			EXP, N06	-	
-	Mask for activating special alarm outputs with NCU-Link			UDWORD	Immediately	
-						
-	-	0x000001	0	0x1FF	7/2	M

Description: This mask is used by developers for diagnostics.

Mask for activating special alarm outputs with NCU-Link if non-cyclic messages cannot be transferred immediately.

Alarm 14764 (NCU-Link cannot immediately transfer all non-cyclic link messages of the stated type) is issued if, for the set type (corresponds to the bits of this MD), the affected message type could not be transferred immediately).

11420	LEN_PROTOCOL_FILE			N01	PGA	
-	Size of protocol files (kB)			DWORD	PowerOn	
-						
-	-	1	1	1000000	7/2	M

Description: Blocks from the part program can be stored in a file in the passive file system with the WRITE command. The length of the log file is limited. If this maximum length is exceeded, the WRITE command returns an error (error code 10).

11422	PROTOCOL_FILE_MODE			EXP, N01	PGA	
-	Setting the behavior of the WRITE command			UDWORD	PowerOn	
-						
-	-	0	0	3	7/2	M

Description: Setting the behavior of the WRITE command for writing to the passive file system

0:

The file created with WRITE is stored persistently in the partition belonging to the directory

The block written with WRITE becomes persistent immediately, i.e. it is stored power failsafe.

With this setting, WRITE is slowed down by the backup.

1:

The file created with WRITE is stored persistently in the partition belonging to the directory

The block written with WRITE becomes persistent after a time delay.

WRITES less than one second old may be lost in the event of a power failure.

WRITE runs faster with this setting.

2-3: Reserved

11450	SEARCH_RUN_MODE			EXP, N01	K1, TE3, N4, H2, Z1	
-	Parameterization for search run			UDWORD	PowerOn	
-						
-	-	0x40	0	0xFF	7/2	M

Description: The behavior during the action blocks after block search can be affected by the following bits:

Bit 0 = 0:

Machining is stopped after loading of the last action block after block search, the NC/PLC interface signal DB21-30 DBX32.6 (last action block active) is set and alarm 10208 is output.

Bit 0 = 1:

Machining is stopped with the loading of the last action block after block search, and the NC/PLC interface signal DB21-30 DBX32.6 (last action block active) is set. Alarm 10208 is not output until the PLC requests it by setting the NC/PLC interface signal DB21-30 DBX1.6 (PLC action finished).

Application:

Starting an ASUB from the PLC after block search.

The message to the operator that another NC start is required in order to continue with the program is not to be displayed until after the end of the ASUB.

Bit 1 = 1

Automatic ASUB start after output of the action blocks. Alarm 10208 is not output until the ASUB has finished.

See also MD11620 \$MN_PROG_EVENT_NAME.

Bit 2 = 0:

Spindle: auxiliary functions are output in the action blocks.

Bit 2 = 1:

The output of the auxiliary functions in the action blocks is suppressed. The spindle programming collected by block search can be output at a later point in time (e.g. in an ASUB).

The program data for this are stored in the following system variables:

- \$P_SEARCH_S,
- \$P_SEARCH_SDIR,
- \$P_SEARCH_SGEAR,
- \$P_SEARCH_SPOS,
- \$P_SEARCH_SPOSMODE

Bit 3 = 1:

The cascaded search run is disabled (default setting: release).

Cascaded search run means that the search run is restarted immediately after finding a search target.

Bit 4: Reserved

Bit 5 = 0:

During block search to a nibbling block, the 1st nibbling stroke is not executed.

Bit 5 = 1:

During block search to a nibbling block, a punching stroke is triggered at block start (1st nibbling stroke).

Bit 6 = 0:

With block search, complex path calculations are made.

Bit 6 = 1:

With block search, calculation is made with simple, computing-time-optimized algorithms.

Bit 7 = 0:

Any adjustment movements that may be necessary on activation of a tangential axis coupling, during or after an SSL, are performed with the feed conditions active in the activation block (G0 or G1 with feedrate). In the case of G1, the feedrate can additionally be set in SD 42121: \$SC_AX_ADJUST_FEED.

Bit 7 = 1:

The adjustment movements necessary on activation of a tangential axis coupling, during or after an SSL, are always performed with rapid traverse feedrate (G0). In this case, the feedrate value in SD 42121: \$SC_AX_ADJUST_FEED is ignored.

2.3 NC machine data

11460	OSCILL_MODE_MASK			N09	P5	
-	Mode mask for asynchronous oscillation			UDWORD	PowerOn	
-						
-	-	0x0	0	0xFFFF	7/2	M

Description: Bit 0
Value 1
In the case of block search, the oscillation movement is started immediately after NC start, i.e. during approach to approach position, provided it has been activated in the program section being processed.
Value 0
(default value)
The oscillation movement is not started until the approach position is reached.

11470	REPOS_MODE_MASK			EXP, N01	K1	
-	Repositioning properties			UDWORD	PowerOn	
-						
-	-	0x8	0	0xFFFF	7/2	M

Description: This bit mask can be used to set the behavior of the control during repositioning.

Bit no.	Meaning when bit set
0 (LSB)	The dwell time is continued in the residual block of the repositioning from where it was interrupted. (If the bit is not set, the dwell time is repeated completely).
1	Reserved
2	When the bit is set, the repositioning of individual axes can be prevented or delayed via the VDI interface.
3	When the bit is set, positioning axes are repositioned in the approach block during search run via program test.
4	As 3, but after every Repos, not only during search run.
5	When the bit is set, changed feeds and spindle speeds already become valid in the residual block, otherwise not until the following block.
6	When the bit is set, neutral axes and positioning spindles are repositioned after SERUPRO as command axes in the approach block.
7	The bit changes the behavior of the VDI-AXIN interface signal DB31,DBX10.0 (Repos Delay). The level of DB31,DBX10.0 (Repos Delay) is read if REPOSA is interpreted.

Axes that are neither geo nor orientation axes are then excluded from the REPOS, that is REPOS does NOT move these axes.

Notice: This bit switches off the channel-specific VDI Signal DB21,DBX31.0..2 (ReposPathMode) completely.

11480	PLC_OB1_TRACE_DEPTH			EXP, N03, N09	-	
-	Buffer depth of PLC trace data at OB1			DWORD	PowerOn	
-						
-	-	2	2	8	2/2	M

Description: Buffer depth of PLC trace data at OB1.
Multiple values of PLC data are buffered, between the time of collection in the PLC and the time of inspection in NCK. Variables traced at "OB1" are collected once per complete PLC scan, but can only be inspected once per IPO cycle.

The buffer size must accommodate at least one more value than the total number of buffered values to be inspected. This is to prevent NCK from inspecting a value that the PLC is in the process of collecting.

A good value to start with is one more than MD10074 \$MN_PLC_IPO_TIME_RATIO.

The larger the buffer depth, the fewer PLC variables that can be traced, because there is a single, small, fixed pool of data slots for sending data samples from the PLC to NCK (64 data slots). Every PLC variable being traced is allocated as many data slots from the pool as the value of the buffer depth.

This single pool of data slots is shared by data collected at OB1, OB35, and OB40 (even though the buffer depths of OB1, OB35, and OB40 can be configured to be different from one another). It is also shared by all concurrent users of trace, even though the users might have no knowledge of one another.

11481	PLC_OB35_TRACE_DEPTH			EXP, N03, N09	-	
-	Buffer depth of PLC trace data at OB35			DWORD	PowerOn	
-						
-	-	2	2	8	2/2	M

Description:

Buffer depth of PLC trace data at OB35.

Multiple values of PLC data are buffered, between the time of collection in the PLC and the time of inspection in NCK. Variables traced at "OB35" are collected every time the PLC timer interrupts, but can only be inspected once per IPO cycle.

The buffer size must accommodate at least one more value than the number of buffered values to be inspected. This is to prevent NCK from inspecting a value that the PLC is in the process of collecting.

A good value to start with is one more than the number of PLC timer interrupts expected to occur every IPO cycle.

The larger the buffer depth, the fewer PLC variables that can be traced, because there is a single, small, fixed pool of data slots for sending data samples from the PLC to NCK (64 data slots). Every PLC variable being traced is allocated as many data slots from the pool as the value of the buffer depth.

The single pool of data slots is shared by data collected at OB1, OB35, and OB40 (even though the buffer depths of OB1, OB35, and OB40 can be configured to be different from each other). It is also shared by all concurrent users of trace, even though the users might have no knowledge of one another.

11482	PLC_OB40_TRACE_DEPTH			EXP, N03, N09	-	
-	Buffer depth of PLC trace data at OB40			DWORD	PowerOn	
-						
-	-	2	2	8	2/2	M

Description:

Buffer depth of PLC trace data at OB40.

Multiple values of PLC data are buffered, between the time of collection in the PLC and the time of inspection in NCK. Variables traced at "OB40" are collected just when the PLC receives the special, programmably initiated OB40 interrupt from NCK, but can only be inspected once per IPO cycle.

The buffer size must accommodate at least one more value than the number of buffered values to be inspected. This is to prevent NCK from inspecting a value that the PLC is in the process of collecting.

If the OB40 interrupt is issued less frequently than once per IPO cycle, then the OB40 buffer depth should be 2. Otherwise it should be one more than the largest number of interrupts expected during any one IPO cycle.

The larger the buffer depth, the fewer PLC variables that can be traced, because there is a single, small, fixed pool of data slots for sending data samples from the PLC to NCK (64 data slots). Every PLC variable being traced is allocated as many data slots from the pool as the value of the buffer depth.

2.3 NC machine data

The single pool of data slots is shared by data collected at OB1, OB35, and OB40 (even though the buffer depths of OB1, OB35, and OB40 can be configured to be different from each other). It is also shared by all concurrent users of trace, even though the users might have no knowledge of one another.

11500	PREVENT_SYNACT_LOCK			N01, N09	S5, FBSY	
-	Protected synchronized actions			DWORD	PowerOn	
-						
-	2	0, 0	0	1399	7/2	M

Description:

First and last IDs of a protected synchronized action area.

Synchronized actions with ID numbers in the protected area can no longer be

- overwritten
- disabled (CANCEL)
- locked (LOCK)

once they have been defined. Furthermore, protected synchronized actions cannot be locked by the PLC (LOCK). They are shown at the interface to the PLC as non-lockable.

Note:

The protection should be suspended while creating the synchronized actions to be protected, as otherwise a Power On will be necessary after every change in order to be able to redefine the logic. There is no area of protected synchronized actions with 0.0. The function is disabled. The values are read as absolute values, and over and under values can be given in any order.

11510	IPO_MAX_LOAD			N01, N05	-	
%	Max. permitted IPO load			DOUBLE	PowerOn	
-						
-	-	0.00	0.0	100.0	7/2	M

Description:

Enable utilization analysis via synchronized actions.

This MD11510 \$MN_IPO_MAX_LOAD sets the IPO computing time (in % of the IPO cycle) after which the variable \$AN_IPO_LOAD_LIMIT is to be set to TRUE. The variable is reset to FALSE if the value falls below this after having once exceeded it.

This diagnostics function is disabled if the machine data is 0.

11550	STOP_MODE_MASK			N01	V1	
-	Defines the stop behavior.			UDWORD	PowerOn	
-						
-	-	0	0	0x1	7/2	M

Description:

This MD describes the stop behavior of the NCK under certain conditions:

Bit no. Meaning

Bit 0 == 0 :=

No stop if G codes G331/G332 are active and a path motion or G4 has also been programmed.

Bit 0 == 1 :=

A stop is possible during G331/G332 with interruption of the continuous-path mode (G60 or G4 between G331/G332 blocks interrupt the continuous-path mode).

Bits 1.....15

Not assigned

11600	BAG_MASK			N01	K1, Z1	
-	Defines the mode group behavior			UDWORD	PowerOn	
-						
-	-	0	0	3	7/2	M

Description:

The MD describes the effect of the VDI signals on all channels of a mode group (BAG) and the behavior of the internal mode changeover in relation to ASUBs and interrupt routines.

Value = 0: When an interrupt is started in a channel of the mode group, all channels of the mode group respond normally to mode group VDI signals (such as BAG-RESET und BAG-STOP). If the interrupt is started from JOG, all channels of the mode group change internally into AUTO mode. Similarly, the mode group automatically switches back to JOG when the interrupt ends.

Value = 1: If an interrupt is started in a channel of the mode group, this channel no longer responds to mode group VDI signals (such as BAG-RESET and BAG-STOP). If, for example, BAG-STOP is triggered, all channels of the mode group are stopped, but the interrupt continues to run. A channel STOP remains active as before. Furthermore, if an interrupt is started from JOG in a channel of the mode group, only this channel automatically changes the mode to AUTO internally, all other channels of the mode group remain in JOG mode. The automatic switch back of the mode at the end of the interrupt only relates correspondingly to the channel in which the interrupt ran.

Value = 2: If an interrupt is started in a channel of the mode group, all channels of the mode group respond normally to mode group VDI signals (such as BAG-RESET and BAG-STOP). If an interrupt is started from JOG in a channel of the mode group, only this channel automatically changes the mode to AUTO internally. All other channels of the mode group remain in JOG mode. The automatic switch back of the mode at the end of the interrupt naturally only relates to the channel in which the interrupt ran. This behavior is not supported until V4.7 SP4 HF1. This setting was not defined in earlier versions. Furthermore, the functionality "JOG in ASUB" is permitted with this setting (see MD11602 \$MN_ASUP_START_MASK, bit3).

Value = 3: As value = 1. But the functionality "JOG in ASUB" is also permitted (see MD11602 \$MN_ASUP_START_MASK, bit3).

11602	ASUP_START_MASK			N01	K1, M3, TE3, TE7	
-	Ignore stop conditions for ASUB			UDWORD	PowerOn	
-						
-	-	0	0	0xf	7/2	M

Description:

This machine data defines which stop reasons are to be ignored on an ASUB start. The ASUB is started or the following stop reasons are ignored:

Bit 0:

STOP reason: STOP key, M0 or M01

An ASUB is started immediately if NCK is in RESET status (or JOG mode) (no ASUB can be started in RESET/JOG without this bit).

Bit 1:

Reserved! This bit was replaced by MD20105 \$MC_PROG_EVENT_IGN_REFP_LOCK and MD20115 \$MC_IGNORE_REFP_LOCK_ASUP.

Bit 2:

Start allowed even if a read-in disable is active; in other words, the blocks of the ASUB program are loaded and executed immediately. This therefore disables machine data MD20107 \$MC_PROG_EVENT_IGN_INHIBIT and MD20116 \$MC_IGNORE_INHIBIT_ASUP. The NCK behavior corresponds to the machine data assignment \$MC_PROG_EVENT_IGN_INHIBIT=H3F \$MC_IGNORE_INHIBIT_ASUP=FFFFFFFF.

If the bit is not set:

The assignment of machine data MD20107 \$MC_PROG_EVENT_IGN_INHIBIT and MD20116 \$MC_IGNORE_INHIBIT_ASUP are evaluated.

If the particular bit in \$MC_PROG_EVENT_IGN_INHIBIT or \$MC_IGNORE_INHIBIT_ASUP is 0, then although an ASUB or prog event are immediately internally initiated, the blocks of the ASUB program are only loaded when the read-in inhibit is withdrawn.

The path is decelerated immediately when the ASUB is triggered (except with option BLSYNC).

The read-in disable is set once more in the ASUB program.

2.3 NC machine data

Bit 3:

Notice:

The following function can always be activated in single-channel systems. Multi-channel systems require bit1 in MD11600 \$MN_BAG_MASK in addition. The function is active o_n_l_y for those ASUBs that were activated from the cancelation program status (Reset channel status). The function is not active in multi-channel systems without MD11600 \$MN_BAG_MASK bit1.

If an ASUB is started automatically from JOG, the user may stop in the middle of the ASUB program. JOG mode is displayed continuously for the user. With bit 3 set, the user may jog in this situation. This is not possible without bit 3. In this case, mode change is locked with alarm 16927. By pressing the Start key, the user can continue the ASUB program. As long as the ASUB program is running, the user is naturally not able to jog. At the end of the ASUB program, the user may jog again.

Bit 4...15: Reserved

Corresponds with:

MD11604 \$MN_ASUP_START_PRIO_LEVEL

MD20105 \$MC_PROG_EVENT_IGN_REFP_LOCK

MD20107 \$MC_PROG_EVENT_IGN_INHIBIT

MD20115 \$MC_IGNORE_REFP_LOCK_ASUP

11604	ASUP_START_PRIO_LEVEL			N01	K1, TE3, TE7	
-	Priorities from which 'ASUP_START_MASK' is effective			DWORD	PowerOn	
-						
-	-	0	0	128	7/2	M

Description:

This machine data defines the ASUB priority from which MD11602 \$MN_ASUP_START_MASK is to be applied. MD11602 \$MN_ASUP_START_MASK is applied from the level specified here up to the highest ASUB priority level 1.

Related to:

MD11602 \$MN_ASUP_START_MASK

11610	ASUP_EDITABLE			N01	K1	
-	Activation of a user-specific ASUB program			UDWORD	PowerOn	
-						
-	-	0	0	0x7	7/2	M

Description:

This MD determines whether user-specific routine: _N_ASUP_SPF stored in directory _N_CUS_DIR/ _N_CMA_DIR is to be used to process RET and REPOS. The user ASUB is searched for first in _N_CUS_DIR.

Value: Meaning:

0 Routine _N_ASUP_SPF is not activated for either RET or REPOS.

Bit0 = 1 User-specific routine _N_ASUP_SPF is executed for RET, the routine supplied by the system is executed for REPOS.

Bit1 = 1 User-specific routine _N_ASUP_SPF is executed for REPOS, the routine supplied by the system is executed for RET

Bit0 = + bit1 = 3 User-specific routine _N_ASUP_SPF is executed for both RET and REPOS

Bit2 = 1 User ASUB _N_ASUP_SPF is searched for first in _N_CMA_DIR

Related to:

MD11612 \$MN_ASUP_EDIT_PROTECTION_LEVEL

11612	ASUP_EDIT_PROTECTION_LEVEL			N01	K1	
-	Protection level of the user-specific ASUB program			DWORD	PowerOn	
-						
-	-	2	0	7	7/2	M

Description: Protection level of the user-specific ASUB program for RET and/or REPOS
The data is active only if MD11610 \$MN_ASUP_EDITABLE is set to a value other than 0.
This machine data defines the protection level of the program _N_ASU_CUS.
MD irrelevant for:
MD11610 \$MN_ASUP_EDITABLE set to 0
Related to:
MD11610 \$MN_ASUP_EDITABLE

11620	PROG_EVENT_NAME				EXP, N12	K1	
-	Program name for PROG_EVENT				STRING	PowerOn	
-							
-	-	-	-	-	7/2	M	

Description: Name of the user program called by the "event-driven program calls" and "automatic ASUB start after block search" functions (MD11450 \$MN_SEARCH_RUN_MODE, bit 1).
_N_PROG_EVENT_SPF is the default setting.
The default setting is activated if MD11620 \$MN_PROG_EVENT_NAME includes a blank string.
If the machine data does not contain a blank string, then the syntax of the string is checked as in the case of a subprogram identifier. This means that the first two characters must be letters (not numbers) or underscores. If this is not the case, alarm 4010 is output during ramp-up.
The program must be located in a cycle directory. When it is called, the search runs through the cycle directories in accordance with the setting of MD11622 \$MN_PROG_EVENT_PATH.
The prefix (_N_) and the suffix (_SPF) of the program name are added automatically if they have not been specified.

11622	PROG_EVENT_PATH			N01	-	
-	Call path for PROG_EVENT			BYTE	PowerOn	
-						
-	-	3	0	3	7/2	M

Description: Path on which the user program set with MD11620 \$MN_PROG_EVENT_NAME is called in response to an event-driven program call configured with MD20108 \$MC_PROG_EVENT_MASK:
0: /_N_CMA_DIR
1: /_N_CUS_DIR
2: /_N_CST_DIR
3: Search path in the sequence /_N_CUS_DIR, /_N_CMA_DIR, and /_N_CST_DIR

11625	FILE_ONLY_WITH_EXTENSION			N01	-	
-	On program call, only search for files with an extension			BYTE	Reset	
-						
-	-	0	0	1	7/3	U

Description: This machine data can be used to set whether the file system is to be searched for files without an extension on a subprogram call. The search for files without an extension can be disabled to speed up the search for a program in the various paths in the file system, e.g. when using EES.
0: On subprogram calls, the search also includes files without an extension

2.3 NC machine data

1: On subprogram calls, the search is restricted to files with an extension (e.g. SPF, MPF etc.)

11626	CYCLES_ONLY_IN_CYCDIR				N01	-	
-	Search for subprograms with PROC instruction in the cycle directories only				BYTE	Reset	
-							
-	-	0	0	2	7/3	U	

Description:

This machine data can be set to limit the search for subprograms that have a PROC instruction and have been stored in the cycle directories (CUS, CMA, CST), to just these directories. The PROC instructions are read in during a warm restart. The function therefore only applies to subprograms that were in the cycle directories at the time of the warm restart.

Use: this setting prevents unnecessary accesses to the external storage during program execution by the function "Execution from External Storage EES" and therefore speeds up calling SIEMENS cycles, for example.

0: On subprogram calls, the NC program is searched for in all program directories in the search path

1: On subprogram calls, the NC program is searched for only in the cycle directories CUS, CMA, and CST

2: On subprogram calls, the NC program is searched for in the directory defined by the CALLPATH instruction, and then in the cycle directories CUS, CMA and CST

11640	ENABLE_CHAN_AX_GAP			N01, N11	K2	
-	Allow channel axis gaps in AXCONF_MACHAX_USED			UDWORD	PowerOn	
-						
-	-	0x0	0	0x1	2/2	M

Description:

Bit0 = 1

Machine data allows configuration of channel axis gaps in the MD20070

\$MC_AXCONF_MACHAX_USED.

Permits following MD assignment:

\$AXCONF_MACHAX_USED[0] = 1 ; 1st MA is 1st axis in channel

\$AXCONF_MACHAX_USED[1] = 2 ; 2nd MA is 2nd axis in channel

\$AXCONF_MACHAX_USED[2] = 0 ; Channel axis gap

\$AXCONF_MACHAX_USED[3] = 3 ; 3rd MA is 3rd axis in channel

\$AXCONF_MACHAX_USED[4] = 0

C A U T I O N:

(BIT0 set with MD20070 \$MC_AXCONF_MACHAX_USED):

If a geo axis is placed in a channel axis gap with MD20050

\$MC_AXCONF_GEOAX_ASSIGN_TAB[1]= 3, the control responds as with MD20050

\$MC_AXCONF_GEOAX_ASSIGN_TAB[1]= 0. This eliminates the geo axis!

Transformation machine data must not be assigned a channel axis number specified as a gap.

BIT1 - BIT31: not used.

11717	D_NO_FCT_CYCLE_NAME			EXP, N12, N07	K1	
-	Subroutine name for D function replacement			STRING	PowerOn	
-						
-	-	-	-	-	7/2	M

Description:

Cycle name for replacement routine of the D function.

If a D function is programmed in a part program block, then, depending on machine data MD10717 \$MN_T_NO_FCT_CYCLE_NAME, MD10719 \$MN_T_NO_FCT_CYCLE_MODE and MD10718 \$MN_M_NO_FCT_CYCLE_PAR, the MD subprogram defined in MD11717 \$MN_D_NO_FCT_CYCLE_NAME is called.

The programmed D number can be polled in the cycle via system variable \$C_D / \$C_D_PROG.

MD11717 \$MN_D_NO_FCT_CYCLE_NAME is only active in Siemens mode (G290).

No more than one M/T/D function replacement can be active per part program line.

A modal subprogram call must not be programmed in the block with the D function replacement. Furthermore, neither subprogram return nor part program end are allowed.

In the event of a conflict alarm 14016 is output.

12080	OVR_REFERENCE_IS_PROG_FEED			N10, N09	V1	
-	Override reference speed			BOOLEAN	PowerOn	
-						
-	-	TRUE	0	-	7/2	M

Description:

The entry in this MD specifies whether the spindle override given by the IS refers to the speed limited by MD/SD or to the programmed speed.

1: Spindle override acts with reference to the programmed speed
(programmed speed _ spindle override 100%)

0: Spindle override acts on the speed limited by MD or SD
(speed limited by MD/SD _ spindle override 100%)

Related machine data:

A speed limitation is effected by the following MDs or SDs:

MD35100 \$MA_SPIND_VELO_LIMIT	Maximum spindle speed
MD35130 \$MA_GEAR_STEP_MAX_VELO_LIMIT	Maximum speed of gear stage
MD35160 \$MA_SPIND_EXTERN_VELO_LIMIT	Spindle speed limitation by PLC
SD43220 \$SA_SPIND_MAX_VELO_G26	Maximum spindle speed
SD43230 \$SA_SPIND_MAX_VELO_LIMS	Spindle speed limitation with G96

12082	OVR_REFERENCE_IS_MIN_FEED				N10, N09	V1	
-	Specification of the reference of the path override				BOOLEAN	PowerOn	
-							
-	-	FALSE	0	-	7/2	M	

Description:

The reference speed for the path feed override specified via the machine control panel can be set differently from the standard.

0: Standard:

The override is relative to the programmed feed.

1: Special case:

The override is relative to the programmed feed or to the path feed limit, depending on which resulting value is lower. In this way, even for a great feed reduction (due to the permissible axis dynamics), the effect of the override value (in the range 0 to 100%) is always visible.

12090	OVR_FUNCTION_MASK			N01, N10, N09	-	
-	Selection of override specifications			UDWORD	Reset	
-						
-	-	0	0	0x01	7/2	M

Description:

The functionality of the override switches can be affected by the bits.

Bit 0: = 0,

Standard: Spindle override active with G331/G332

= 1,

Path override is active instead of spindle override with G331/G332

(Tapping without compensating chuck)

12100	OVR_FACTOR_LIMIT_BIN			EXP, N10	V1, B1, Z1	
-	Limitation for binary-coded override switch			DOUBLE	PowerOn	
-						
-	-	1.2	0.0	2.0	7/2	M

Description:

This machine data can be used as an additional limit for the override factor when using the binary-coded interface for path, axis and spindle feeds.

In this case, the maximum values

- 200% for channel-specific feed override
- 100% for channel-specific rapid traverse override
- 200% for axis-specific feed override
- 200% for spindle override

2.3 NC machine data

are replaced with the limit value entered in MD: OVR_FACTOR_LIMIT_BIN when this value is lower.

Example: OVR_FACTOR_LIMIT_BIN = 1.20

--> maximum override factor for

- channel-specific feed override =120%
- channel-specific rapid traverse override =100%
- axis-specific feed override =120%
- spindle override =120%

This value also defines the dynamic reserves maintained by the speed control for increasing the path and spindle feedrates.

12200	RUN_OVERRIDE_0			N01, N09	FBMA, V1, Z1	
-	Traversing response with override 0			BOOLEAN	PowerOn	
-						
-	-	FALSE	0	-	7/2	M

Description:

= 0

Override 0 is active and means deceleration (JOG mode, safety function).

Bits 0 and 1 in MD32084 \$MA_HANDWH_STOP_COND for hand wheels and in MD20624 \$MC_HANDWH_CHAN_STOP_COND for machine axes define whether the pulses are collected for geometry axes and contour handwheel.

= 1

Traversing with handwheels and in JOG mode with fixed feedrates is also possible with a 0 % override.

Related to:

MD32084 \$MA_HANDWH_STOP_COND

MD20624 \$MC_HANDWH_CHAN_STOP_COND

12202	PERMANENT_FEED			N01, N09	Z1, V1	
mm/min	Fixed feedrates for linear axes			DOUBLE	Reset	
-						
-	4	0., 0., 0., 0.	0.0	1.0E+301	7/2	M

Description:

In AUTOMATIC mode:

After activating a fixed feedrate via an interface signal, traversing is done with a fixed feedrate instead of the programmed feedrate.

Note:

The fixed feedrate is also evaluated in continuous-path mode in order to optimize the overhead for the Look Ahead calculation. Unnecessarily high values should therefore be avoided. Enter zero if a fixed feedrate is not wanted

In JOG mode:

After activating a fixed feedrate via an interface signal, and traversing the linear axis with a traversing key, traversing proceeds in the selected direction with the fixed feedrate.

n = 0, 1, 2, 3 mean fixed feedrates 1, 2, 3, 4. The values must be entered in ascending order.

Special cases, errors,

The maximum velocity defined by MD32000 \$MA_MAX_AX_VELO is active.

An override setting of 100 % is assumed. MD12200 \$MN_RUN_OVERRIDE_0 is active if the override is 0.

Related to:

MD12200 \$MN_RUN_OVERRIDE_0

12204	PERMANENT_ROT_AX_FEED			N01, N09	V1	
rev/min	Fixed feedrates for rotary axes			DOUBLE	Reset	
-						
-	4	0., 0., 0., 0.	0.0	1.0E+301	7/2	M

Description:

Fixed feedrate values:

In AUTOMATIC mode:

After activating a fixed feedrate via an interface signal, traversing is done with a fixed feedrate instead of the programmed feedrate.

Note: PERMANENT_ROT_AX_FEED is used instead of PERMANENT_FEED for the path motion if all synchronously traversed axes in the current block are rotary axes. PERMANENT_FEED applies if linear and rotary axes are to be synchronously traversed together.

The fixed feedrate is also evaluated in continuous-path mode in order to optimize the overhead for the Look Ahead calculation. Unnecessarily high values should therefore be avoided. Enter zero if a fixed feedrate is not wanted

In JOG mode:

After activating a fixed feedrate via an interface signal, and traversing the rotary axis with a traversing key, traversing proceeds in the selected direction with the fixed feedrate.

n = 0, 1, 2, 3 mean fixed feedrates 1, 2, 3, 4.

Special cases, errors,

The maximum velocity defined by MD32000 \$MA_MAX_AX_VELO is active.

An override setting of 100 % is assumed. MD12200 \$MN_RUN_OVERRIDE_0 is active if the override is 0.

Related to:

MD12200 \$MN_RUN_OVERRIDE_0

12205	PERMANENT_SPINDLE_FEED			N01, N09	FBMA	
rev/min	Fixed feedrates for spindles			DOUBLE	Reset	
-						
-	4	0.. 0.. 0.. 0.	0.0	1.0E+301	7/2	M

Description:

Fixed feedrate values:

JOG: A spindle is traversed with a fixed feedrate by activating the traversing keys and activating the appropriate signals in the PLC interface.

The override is not active.

Depending upon MD12200 \$MN_RUN_OVERRIDE_0, traversing also takes place with override 0.

The value defined by MD32000 \$MA_MAX_AX_VELO is taken as the upper limit. If the fixed feedrate has a larger value, the aforementioned limiting value applies.

12300	CENTRAL_LUBRICATION			N01, N09	-	
-	Central lubrication active			BOOLEAN	PowerOn	
-						
-	-	FALSE	0	-	7/2	M

Description:

When a settable axial path has been exceeded, the axial VDI signals request a lubrication pulse from the PLC (compare MD33050 \$MA_LUBRICATION_DIST). These axial pulses act (by default) independently of each other.

If the machine construction requires a central lubrication, i.e. the lubrication pulse of any axis is acting on all axes, the corresponding path monitoring of all axes must be restarted after lubrication pulse output. This start synchronization of the monitoring is executed via MD12300 \$MN_CENTRAL_LUBRICATION=TRUE.

12701	AXCT_AXCONF_ASSIGN_TAB1	N01	B3
-	Assignment of an axis container location	STRING	PowerOn
CTDE			
-	32	-	M

Description:

Assignment of an axis container location (slot s) to a machine axis or link axis. A maximum of 32 locations can be assigned axes in an axis container.

Structure of entries:

NCm_AXn with NCU number m: 1..16
 and machine axis address n: 1... 31

Example:

NC2_AX1 ; The axis is on the NCU2 and is the
 ; 1st machine axis there.

AX5 ; local axis 5 only with one NCU
 ; the axis container mechanism is only used by
 ; several channels of one NCU.

The reference to an axis container location of a channel is defined by the definitions in MD20070 \$MC_AXCONF_MACHAX_USED and MD10002 \$MN_AXCONF_LOGIC_MACHAX_TAB.

The actually assigned axis at a specific time is dependent upon the container rotation status. All channels that access an axis container use the same axis entries stored there. If channels of various NCUs access this container, then inter-NCU consistency must be ensured.

Example:

CHANDATA(1)
 \$MC_MACHAX_USED[4]=9 MD10002 \$MN_AXCONF_LOGIC_MACHAX_TAB[8]=CL1_SL1
 MD12701 \$MN_AXCT_AXCONF_ASSIGN_TAB1[0]="NC1_AX1" MD12701
 \$MN_AXCT_AXCONF_ASSIGN_TAB1[1]="NC2_AX1"

This machine data is distributed via NCU-link.

-	32	-	M

Description:

Assignment of an axis container location (slot s) to a machine axis or link axis. A maximum of 32 locations can be assigned axes in an axis container.

Structure of entries:

NCm_AXn with NCU number m: 1..16
 and machine axis address n: 1... 31

Example:

NC2_AX1 ; The axis is on the NCU2 and is the
 ; 1st machine axis there.

AX5 ; local axis 5 only with one NCU
 ; the axis container mechanism is only used by
 ; several channels of one NCU.

The reference to an axis container location of a channel is defined by the definitions in MD20070 \$MC_AXCONF_MACHAX_USED and MD10002 \$MN_AXCONF_LOGIC_MACHAX_TAB.

2.3 NC machine data

The actually assigned axis at a specific time is dependent upon the container rotation status. All channels that access an axis container use the same axis entries stored there. If channels of various NCUs access this container, then inter-NCU consistency must be ensured.

Example:

```
CHANDATA(1)
$MC_MACHAX_USED[4]=9
MD10002 $MN_AXCONF_LOGIC_MACHAX_TAB[8]=CL1_SL1
MD12701 $MN_AXCT_AXCONF_ASSIGN_TAB1[0]="NC1_AX1"
MD12701 $MN_AXCT_AXCONF_ASSIGN_TAB1[1]="NC2_AX1"
This machine data is distributed via NCU-link.
```

Related to:

MD10002 \$MN_AXCONF_LOGIC_MACHAX_TAB

12703	AXCT_AXCONF_ASSIGN_TAB3			N01	B3	
-	Assignment of an axis container location			STRING	PowerOn	
CTDE						
-	32	-	-	-	3/2	M

Description: Assignment of an axis container location (slot s) to a machine axis or link axis. A maximum of 32 locations can be assigned axes in an axis container.

Method of writing entries:

NCm_AXn with NCU number m: 1..16
 and machine axis address n: 1... 31

Example:

```
NC2_AX1 ; The axis is on the NCU2 and is the
          ; 1st machine axis there
AX5      ; local axis 5, with only one NCU
          ; the axis container mechanism is only used by
          ; several channels of one NCU.
```

The reference to an axis container location of a channel is determined by the definitions in

MD20070 \$MC_AXCONF_MACHAX_USED and MD10002 \$MN_AXCONF_LOGIC_MACHAX_TAB.

The axis actually assigned at a given time is dependent upon the container rotation status. All channels that access an axis container use the same axis entries stored there. If channels from various NCUs access this container, ensure that there is consistency between the NCUs.

Example:

```
CHANDATA(1)
$MC_MACHAX_USED[4]=9      MD10002 $MN_AXCONF_LOGIC_MACHAX_TAB[8]=CL1_SL1
MD12701 $MN_AXCT_AXCONF_ASSIGN_TAB1[0]="NC1_AX1"      MD12701
$MN_AXCT_AXCONF_ASSIGN_TAB1[1]="NC2_AX1"
This machine data is distributed over the NCU-link.
```

		-	3/2
			M

Description:

Assignment of an axis container location (slot s) to a machine axis or link axis. A maximum of 32 locations can be assigned axes in an axis container.

Method of writing entries:

NCm_AXn with NCU number m: 1..16
 and machine axis address n: 1... 31

Example:

NC2_AX1 ; The axis is on the NCU2 and is the
 ; 1st machine axis there

 AX5 ; local axis 5, with only one NCU
 ; the axis container mechanism is only used by
 ; several channels of one NCU.

The reference to an axis container location of a channel is determined by the definitions in MD20070 \$MC_AXCONF_MACHAX_USED and MD10002 \$MN_AXCONF_LOGIC_MACHAX_TAB.

The axis actually assigned at a given time is dependent upon the container rotation status. All channels that access an axis container use the same axis entries stored there. If channels from various NCUs access this container, ensure that there is consistency between the NCUs!

Example:

CHANDATA(1)

 \$MC_MACHAX_USED[4]=9

2.3 NC machine data

```
MD10002 $MN_AXCONF_LOGIC_MACHAX_TAB[8]=CL1_SL1      MD12701
$MN_AXCT_AXCONF_ASSIGN_TAB1[0]="NC1_AX1"
MD12701 $MN_AXCT_AXCONF_ASSIGN_TAB1[1]="NC2_AX1"
```

This machine data is distributed over the NCU-link.

-	Axis container identifier			STRING	PowerOn	
CTDE						
-	16	CT1, CT2, CT3, CT4, CT5, CT6, CT7, CT8...	-	-	1/1	M

Description:

List of axis container identifiers

In addition to the channel identifier of an axis, the axis container identifier, which can be defined by the user here, can also be used as an axis container name for e.g. a rotation of an axis container (AXCTSWE(CT1)).

12760	AXCT_FUNCTION_MASK			N09	-	
-	Functions for the axis container			UDWORD	NEW CONF	
-						
-	-	0x0	0	0x1	1/1	M

Description: This MD is used to set the specific functions for the axis container.
The MD is bit-coded, the following bits are assigned:
Bit 0 = 0: For a direct axis container switch (AXCTSWED), all other channels must be in RESET status.
Bit 0 = 1: For a direct axis container switch (AXCTSWED), only those other channels which have interpolation right on axes of the axis container must be in RESET status.

13050	DRIVE_LOGIC_ADDRESS			N04, N10	G2	
-	Logical drive addresses			DWORD	PowerOn	
-						
-	31	4100, 4140, 4180, 4220, 4260, 4300, 4340, 4380...	258	16383	7/2	M

Description: For PROFIdrive only:
Logical I/O addresses of the PROFIdrive drives on the PROFIBUS/PROFINET that can be assigned to an axis.
The MD value is the logical I/O address of the drive assigned with HW-Config (SIMATIC Manager S7).
The index n from \$MN_DRIVE_LOGIC_ADDRESS[n] is used for actual value and setpoint assignment:
MD30220 \$MA_ENC_MODULE_NR=n+1, MD30110 \$MA_CTRL_OUT_MODULE_NR=n+1.

13060	DRIVE_TELEGRAM_TYPE			N04, N10	G2	
-	Standard message frame type for PROFIdrive			DWORD	PowerOn	
-						
-	31	116, 116, 116, 116, 116, 116, 116, 116...	0	-	7/2	M

Description: For PROFIdrive only:
Standard telegram type for PROFIdrive axes:
0 = No standard type, user-defined
(telegram type 103 is then used internally in the NCK,
whereby other process data can be added.)
1... 6 = PROFIdrive type
101...107 = SIEMENS type
116 = SIEMENS type as 106 plus trace data
118 = SIEMENS type as 116, but use of encoders 2+3
136 = SIEMENS type as 116 plus torque feedforward control
138 = SIEMENS type as 136, but use of encoders 2+3
139 = SIEMENS type telegram specifically for Weiss spindle functionality
146 = SIEMENS type as 136 with adaptations and supplementary diagnostics
148 = SIEMENS type as 138 with adaptations and supplementary diagnostics
149 = SIEMENS type as 139 with adaptations and supplementary diagnostics

Notes:

2.3 NC machine data

The descriptions of the SIEMENS telegram type can be found in the SINAMICS function plan.

Alarm 26015 is issued with reference to this machine data if the telegram configuration exhibits inconsistencies, in other words if the telegram type selected on the NCK does not match the telegram type set on the drive (see drive parameter p922) and the process data configuration does not match (see drive parameters p923, p915, p916). The check for telegram configuration errors can be disabled using MD DRIVE_FUNCTION_MASK bit 15.

The SIEMENS telegram types 1xx must be operated in the SINUMERIK context in 611U interface mode.

13070	DRIVE_FUNCTION_MASK			N04, N10	G2	
-	PROFIdrive expansion functions			UDWORD	PowerOn	
-						
-	31	2, 2, 2, 2, 2, 2, 2...	0	0x7FFFFFFF	7/2	M

Description:

For PROFIdrive only:

Bit-coded mask for skipping the scope of available functions for PROFIdrive axes expected by the NCK.

Meaning of set bits:

Bit 0: Deactivation of axial drive alarm display

Note: the effect of this bit may be hidden, depending on the value in MD13140 \$MN_PROFIBUS_ALARM_ACCESS.

Bit 1: Reserved, free (previous deactivation of 611U description file intermediate storage in the NCK)

Bit 2: Deactivation of axial encoder driver parameter accesses

Bit 3: Deactivation of axial output driver parameter accesses

Bit 4: Reserved, free (previous activation of DSC bits)

Bit 5: Deactivation of the 611U-specific drive parking (STW2.7/STA2.7)

Bit 6: Deactivation of the 611U-specific travel to fixed stop (STW2.8/STA2.8)

Bit 7: Deactivation of the 611U-specific motor switching int. (STW2.9 to 2.11)

Bit 8: Deactivation of the 611U-specific ramp block (STW1.11+13)

Bit 9: Deactivation of the 611U-specific function generator bits (STW1.8/STA1.13)

Bit 10: Deactivation of the control of the holding brake (STW1.12 / STA2.5)

Bit 11: Deactivation of the effect of OFF2/OFF3 on DB31, ... DBX93.5 (Drive Ready)

Bit 12: Deactivation of the error/alarm class SINAMICS (STA1.11 to STA1.12)

Bit 13: Drive parking simulation (STA2.7 = STW2.7)

Bit 14: Selection of non-cyclical communication 0 = DPT 1 = DPV1

Bit 15: Deactivation of the consistency check of the PROFIdrive message frame configuration

Configuration of bits 5 - 10 allows adaptation of certain control or status bits that are not standardized in the PROFIdrive profile. The bits may have a different significance and effect in the default setting of third-party drives.

13080	DRIVE_TYPE_DP			EXP	G2	
-	PROFIBUS/PROFINET drive type			BYTE	PowerOn	
-						
-	31	0, 0, 0, 0, 0, 0, 0...	0	5	7/2	M

Description:

MD is relevant to PROFIdrive drives at the PROFIBUS/PROFINET:

Drive type:

0: No drive or drive type unknown (default), software-internally treated as:

- 1: FDD drive (SRM: Synchronous rotary drive)
- 2: MSD drive (ARM: Asynchronous rotary drive)
- 3: Linear drive
- 4: Analog drive (no automatic entry)
- 5: Hydraulic drive

Note:

In general, the drive type is entered automatically with Siemens drives as soon as the drives start operating.

With non-Siemens drives (at least with linear drives), the value must be entered manually if automatic drive recognition is not possible.

840dsl-731	15	6500, 0, 0, 0, 0, 0, 0, 0...	0	16383	7/2	M

Description:

For PROFIBUS/PROFINET, SINAMICS:

Logical I/O address of a SINAMICS-CU (Control Unit) on the PROFIBUS/PROFINET.

The cyclic DP communication with SINAMICS-CU is activated by taking over the associated slot address from the STEP7 project. The onboard I/Os cannot be accessed until after configuration.

13140	PROFIBUS_ALARM_ACCESS			N04, N10	-	
-	Alarm response of PROFIBUS/PROFINET drives on power up			DWORD	Immediately	
-						
-	-	1	0	2	2/7	M

Description:

For PROFIBUS/PROFINET only:

Specifies the time of activation for evaluation/transmission of PROFIBUS/PROFINET node alarms or warnings

(fine diagnostics messages) on the NCK.

Affects drive alarms or warnings 380500, 380501

(or alarms 200000ff etc. created from these in the HMI)

as well as drive safety alarms 27900.

Meaning of the MD values:

0 = alarms/warnings are evaluated immediately

1 = alarms/warnings are not evaluated
 2 = alarms are evaluated only after power up, i.e.
 as soon as HMI has set value 2 active again (NCK automatically
 resets the MD value to 1 at every power up; HMI must
 explicitly articulate its readiness for message processing
 by setting value 2)

Note: the MD restricts the range or effectiveness

of MD13150 \$MN_SINAMICS_ALARM_MASK

Default: the display default behavior of the mentioned drive

alarms changes with the introduction of this MD.

Now the alarms are not transported and displayed

by default.

The previous default behavior can be restored

with MD13140 \$MN_PROFIBUS_ALARM_ACCESS=0.

13150	SINAMICS_ALARM_MASK			N04, N05	-	
-	Activate fault and warning buffer output for Sinamics			UDWORD	Immediately	
-						
-	-	0x0909	0	0x7FFFFFFF	7/2	M

Description:

For PROFIBUS/PROFINET only, especially SINAMICS:

Relevant to SINAMICS diagnostics:

Note: the effect of this MD may be hidden independently of

the value of MD13140 \$MN_PROFIBUS_ALARM_ACCESS.

Mask for displaying the SINAMICS DOS fault and warning buffers

Bit set: Alarms in this DO group are output

Bit not set: Alarms in this DO group are not output

Bit Hex. Meaning

value

=====

0:	0x1	Output faults of the Control Units
1:	0x2	Reserved
2:	0x4	Output faults of the Drive Controls
3:	0x8	Output faults of the Line Modules
4:	0x10	Output faults of the Terminal Boards
5:	0x20	Output faults of the Terminal Modules
8:	0x100	Output warnings of the Control Units
9:	0x200	Output warnings of the Communication Objects

11:	0x800	Output warnings of the Line Modules
12:	0x1000	Output warnings of the Terminal Boards
13:	0x2000	Output warnings of the Terminal Modules

13160	SINAMICS_MAX_SLAVE_ADDRESS			N04, N10	-	
-	Highest SINAMICS slave address			DWORD	PowerOn	
-						
-	4	0, 0, 0, 0	0	-	7/2	M

Description:

Highest slave/device address supported per bus

All slaves/devices with an address higher than the address set here are ignored by the NCK

2.3 NC machine data

Value 0: No limitation

13200	MEAS_PROBE_LOW_ACTIVE			N10, N09	M5	
-	Polarity reversal of sensor			BOOLEAN	NEW CONF	
-						
-	2	FALSE, FALSE	0	-	7/2	M

Description: This MD defines the electrical polarity of each connected sensor.

Value 0:

(Default setting)

Non-deflected state 0 V

Deflected state 24 V

Value 1:

Non-deflected state 24 V

Deflected state 0 V

The programmed edges of the sensor are independent of the electrical polarity, and are to be regarded as purely mechanical. The programming of a positive edge always means the transition from the non-deflected into the deflected state. The programming of a negative edge always means the transition from the deflected into the non-deflected state.

13210	MEAS_TYPE			N10, N09	M5	
-	Meas. type with decentralized drives			BYTE	PowerOn	
-						
-	-	0	0	1	7/2	M

Description: For PROFIdrive only:

This MD sets the measuring function of decentralized drives.

The MD currently only functions for PROFIdrive drives.

MEAS_TYPE = 0 defines:

A probe is used that is connected centrally to the NC.

However, as the encoders only provide actual position values in cycles, the actual measuring position is found by interpolation.

MEAS_TYPE = 1 defines:

The probe must be wired decentralized to ALL drives.

The measuring functionality of the drive is then used,

saving the actual encoder values in the hardware at the time of the measuring edge.

This method is more accurate than that with MEAS_TYPE = 0, but it requires a more complex wiring and drives that support this measuring functionality (e.g. 611U).

13211	MEAS_CENTRAL_SOURCE			N10, N09	-	
-	Data source central measurement with PROFIBUS/PROFINET drives			BYTE	PowerOn	
-						
-	-	3	1	3	7/2	M

Description: For PROFIBUS/PROFINET only:

Sets the method used to obtain the time stamps for central measurement with PROFIdrive drives.

For MEAS_CENTRAL_SOURCE = 1, the following applies:

NRK access operations are used in order to access the onboard measuring register.

For this purpose, the appropriate hardware, which permits this, must be available, e.g. for 840Di with MCI-Extension Board.

For MEAS_CENTRAL_SOURCE = 2, the following applies:

The SINAMICS DO1 telegram is used (telegram types 391 and 395), and more specifically in the "Cyclic measurement" version without handshake.

For this purpose, an integrated SINAMICS must be available, e.g. NCU 710.

For measurement without handshake, two probes must be available in drive parameters p0680 index 0 and 1.

For MEAS_CENTRAL_SOURCE = 3, the following applies:

The SINAMICS DO1 telegram is used (telegram type 391), and more specifically in a version with handshake. This technique is fault-tolerant, however, it only permits a measurement edge every 4 PROFIBUS/PROFINET cycles, i.e. it is therefore significantly slower.

For this purpose, an integrated SINAMICS must be available, e.g. NCU 710.

This MD is only relevant, if MD13210 \$MN_MEAS_TYPE == 0.

13220	MEAS_PROBE_DELAY_TIME			N10, N09	FBA	
s	Delay time between probe deflection and recognition			DOUBLE	NEW CONF	
-						
-	2	0.0, 0.0	0	0.1	7/2	M

Description: For probes with, for example, radio transmission, the probe deflection can be detected in the NC only with delay.

With this MD, the transmission link delay between the probe deflection and its detection is set in the control.

The measured value is corrected internally by the control by the distance that corresponds to the traversing motion during this time before measuring (modeling).

As the modeling does not work with the expected accuracy at higher position control cycles, the delay time is limited independently of the input value to 31 position control cycles).

13230	MEAS_PROBE_SOURCE			N10, N09	-	
-	Probe simulation			BYTE	PowerOn	
-						
-	-	0	0	9	7/2	M

Description: Simulation of the probe only works when all axes are simulated.

Value = 0: the probe is triggered on the programmed end position.

Value = 1-8: the probe is triggered via digital output with the number=value.

Value = 9: reserved

13231	MEAS_PROBE_OFFSET			N10, N09	-	
mm/inch, degrees	Probe offset			DOUBLE	Immediately	
-						
-	-	0.1	-MD_DBLMAX	1.0E+301	7/7	U

Description: The switching position of the probe is offset by the value.

The offset is only active with the simulated probes and MD 13230 \$MN_MEAS_PROBE_SOURCE=0.

2.3 NC machine data

13300	PROFISAFE_IN_FILTER			N01, N10	-	
-	Useful F data filter IN			UDWORD	PowerOn	
-						
-	48	0xFFFFFFFF, 0xFFFFFFFF, 0xFFFFFFFF, 0xFFFFFFFF, 0xFFFFFFFF, 0xFF...	0x0	0xFFFFFFFF	7/2	M

Description:

Filter between F user data and \$A_INSE variables

This machine data defines which bits are transferred from the F user data interface of the PROFIsafe module to the NCK for further processing.

The filtered F user data bits are compressed internally in the NCK to form a contiguous bit field.

Machine data MD10388 \$MN_PROFISAFE_IN_ASSIGN then also defines the \$A_INSE variables to which the filtered F user data bits are transferred.

Example:

Note:

Only 16 bits are shown for the sake of simplicity.

Parameterization:

\$MN_PROFISAFE_IN_FILTER = 1010100101000100

\$MN_PROFISAFE_IN_ASSIGN = 011006

```
n = 16      11      6      1
|x|x|x|x|x|1|1|1|0|0|1|x|x|x|x|
```

\$A_INSE[n], x = irrelevant

```
|0|0|0|0|0|0|0|0|0|0|1|1|1|0|0|1|
```

NCK-internal image of F user data

```
|1|0|1|0|1|0|0|1|0|0|1|0|0|0|1|0|0|
```

\$MN_PROFISAFE_IN_FILTER

```
|1|0|1|0|1|0|0|0|0|0|0|0|0|1|0|0|
```

Example value present at F user data interface of the PROFIsafe module

13301	PROFISAFE_OUT_FILTER			N01, N10	-	
-	Useful F data filter OUT			UDWORD	PowerOn	
-						
-	48	0xFFFFFFFF, 0xFFFFFFFF, 0xFFFFFFFF, 0xFFFFFFFF, 0xFFFFFFFF, 0xFF...	0x0	0xFFFFFFFF	7/2	M

Description:

Filter between \$A_OUTSE variables and F user data

This machine data defines to which F user data bits the \$A_OUTSE[n] variables concerned are transferred.

Machine data MD10389 \$MN_PROFISAFE_OUT_ASSIGN defines which \$A_OUTSE[n] variables are transferred to the F user data bits of the PROFIsafe module.

Example:

Note:

Only 16 bits are shown for the sake of simplicity.

Parameterization:

\$MN_PROFISAFE_OUT_FILTER = 1010100101000100

\$MN_PROFISAFE_OUT_ASSIGN = 011006

```
n = 16      11      6      1
```

```

|x|x|x|x|x|1|1|1|1|1|x|x|x|x|x|
Example value present in the $A_OUTSE variables, x = irrelevant
|0|0|0|0|0|0|0|0|0|0|1|1|1|1|1|
NCK-internal image of F user data
|1|0|1|0|1|0|0|1|0|1|0|0|0|0|1|0|0|
$MN_PROFISAFE_OUT_FILTER
|1|0|1|0|1|0|0|1|0|1|0|0|0|0|1|0|0|
F user data of the PROFIsafe module

```

13302	PROFISAFE_IN_ENABLE_MASK			N01, N10	-	
-	Enable mask for connections to PROFIsafe input modules.			UDWORD	PowerOn	
-						
-	2	0x0, 0x0	0x0, 0x0	0xFFFFFFFF, 0x0000FFFF	7/2	M

Description: The enable mask is used to enable the machine data blocks for the connections to PROFIsafe input modules.

A machine data block comprises the following data:

- MD10386 \$MN_PROFISAFE_IN_ADDRESS[n]
- MD10388 \$MN_PROFISAFE_IN_ASSIGN[n]
- MD13300 \$MN_PROFISAFE_IN_FILTER[n]
- MD13305 \$MN_PROFISAFE_IN_SUBS[n]

Bit n = 0

The machine data block [n] is checked for consistency but not activated.

The PROFIsafe connection [n] or the slot [n] is not active.

Bit n = 1

The machine data block [n] is active.

The PROFIsafe connection [n] or the slot [n] is active.

Related to:

MD10095: \$MN_SAFE_MODE_MASK, Bit 1

MD13304: \$MN_PROFISAFE_IN_SUBS_ENAB_MASK

13303	PROFISAFE_OUT_ENABLE_MASK			N01, N10	-	
-	Enable mask for connections to PROFIsafe output modules.			UDWORD	PowerOn	
-						
-	2	0x0, 0x0	0x0, 0x0	0xFFFFFFFF, 0x0000FFFF	7/2	M

Description: The enable mask is used to enable the machine data blocks for the connections to PROFIsafe output modules.

A machine data block comprises the following data:

- MD10387 \$MN_PROFISAFE_OUT_ADDRESS[n]
- MD10389 \$MN_PROFISAFE_OUT_ASSIGN[n]
- MD13301 \$MN_PROFISAFE_OUT_FILTER[n]

Bit n = 0

The machine data block [n] is checked for consistency but not activated.

The PROFIsafe connection [n] or the slot [n] is not active.

Bit n = 1

The machine data block [n] is active.

The PROFIsafe connection [n] or the slot [n] is active.

Related to:

MD10095: \$MN_SAFE_MODE_MASK, Bit 1

2.3 NC machine data

13304	PROFISAFE_IN_SUBS_ENAB_MASK			N01, N10	-	
-	Activation of substitute value output for PROFIsafe input modules			UDWORD	PowerOn	
-						
-	2	0x0, 0x0	0x0, 0x0	0xFFFFFFFF, 0x0000FFFF	7/2	M

Description:

The enable mask is used to enable substitute value output for connections to PROFIsafe input modules.

Bit n = 0

The PROFIsafe input module's process data is transferred to the SPL input data for the connection parameterized in machine data block [n].

The PROFIsafe connection [n] or the slot [n] is active.

Bit n = 1

The substitute values from MD13305 \$MN_PROFISAFE_IN_SUBS are transferred to the SPL input data for the connection parameterized in machine data block [n].

The PROFIsafe connection [n] or the slot [n] is passive.

Related to:

MD10095: \$MN_SAFE_MODE_MASK, Bit 1

MD13305: \$MN_PROFISAFE_IN_SUBS

13305	PROFISAFE_IN_SUBS			N01, N10	-	
-	Substitute values for passive connections to PROFIsafe input modules			UDWORD	PowerOn	
-						
-	48	0x0, 0x0, 0x0, 0x0, 0x0, 0x0, 0x0, 0x0...	0x0	0xFFFFFFFF	7/2	M

Description:

For passive connections to PROFIsafe input modules, the substitute values parameterized in the machine data are transferred to the SPL inputs (\$A_INSE) parameterized in MD10388 \$MN_PROFISAFE_IN_ASSIGN[n].

If the SPL inputs parameterized in MD10388 \$MN_PROFISAFE_IN_ASSIGN[n] overlap the SPL inputs of an active slot, the control will modify the passive slot's substitute values in order to prevent duplicate assignment of the SPL inputs. Here, the states of the signals from the active slots have priority.

Related to:

MD10095: \$MN_SAFE_MODE_MASK, bit 1

MD13304: \$MN_PROFISAFE_IN_SUBS_ENAB_MASK

-	4	0, 0, 0, 0	0	0xFFFFFFFF	ReadOnly	S

155

2.3 NC machine data

Index 3: PROFIsafe parameter from the S7 configuration

13319	SAFE_GLOB_DES_CHECKSUM			N01, N05	FBSI	
-	Desired (expected) checksum			UDWORD	PowerOn	
-						
-	4	0, 0, 0, 0	0	0xFFFFFFFF	7/1	M

Description: In this data, the set checksum stored at the time of the last machine acceptance overwrites the current values of the safety relevant machine data.

Assignment of the field indices:

Index 0: General safety parameterization, parameterization of the SPL-I/O link

Index 1: SPL user data

Index 2: Enable for I/O link (PROFIsafe and F_SEND/F_RECV)

Index 3: PROFIsafe parameter from the S7 configuration

13320	SAFE_SRD_P_IPO_TIME_RATIO			N01, N10	FBSI	
-	Factor F_DP communication cycle			DWORD	PowerOn	
SFCO						
-	-	10	1	65535	7/2	M

Description: Ratio between interpolator cycle and F_DP cycle, in which the F_DP communication is performed. In the resulting time interval the NCK triggers OB40 on the PLC in order to perform the F_DP communication.

The value for the communication cycle resulting from this MD and the set IPO cycle must not exceed 250ms.

13322	INFO_SAFE_SRDP_CYCLE_TIME			N01, N10, N05	FBSI	
s	Maximum F_DP communication cycle			DOUBLE	PowerOn	
-						
-	-	0.0	-	-	ReadOnly	S

Description: Display data:

Displays the maximum time frame in which F_DP communication with the system coupling is performed that is operated on the PLC via OB40.

The value is obtained from the interpolation cycle and MD13320 \$MN_SAFE_SRD_P_IPO_TIME_RATIO.

If the set communication cycle in cyclic operation is exceeded, this is also displayed here.

In the case of a parameterization error (communication cycle exceeds the maximum value of 250.0 ms), the maximum value that can be set is displayed.

13330	SAFE_SDP_ENABLE_MASK			N01, N10	FBSI	
-	Enable screen F_SENDDP communication relationships			UDWORD	PowerOn	
-						
-	-	0x0	0x0	0xFFFF	7/2	M

Description: Enable screen for the individual F_SENDDP communication links and their SPL connections

13331	SAFE_SDP_ID			N01, N10	FBSI	
-	ID for F_SENDDP communication relationship			DWORD	PowerOn	
-						
-	16	0, 0, 0, 0, 0, 0, 0, 0...	-32768	32767	7/2	M

Description: Any network unique value as ID for F_SENDDP communication relationship.

SIMATIC module parameter: DP_DP_ID

13332	SAFE_SDP_NAME			N01, N10	FBSI	
-	Name of the F_SENDDP communication link			STRING	PowerOn	
-						
-	16	-	-	-	7/2	M

Description: A name can be assigned to each F_SENDDP communication link.
If a name was assigned, this name will be displayed in the alarm text instead of DP_DP_ID.

13333	SAFE_SDP_CONNECTION_NR			N01, N10	FBSI	
-	Number of the F_SENDDP SPL connection			BYTE	PowerOn	
-						
-	16	0, 0, 0, 0, 0, 0, 0, 0...	0	16	7/2	M

Description: This machine data is used to set the number of the F_SENDDP SPL connection that is parameterized with this data record.
The number of the F_SENDDP SPL connection is also the index for access to the system variables of the user interface of this F_SENDDP SPL connection.
This applies to the following system variables:
- \$A_FSDP_ERR_REAC
- \$A_FSDP_ERROR
- \$A_FSDP_SUBS_ON
- \$A_FSDP_DIAG
Example:
MD13333 \$MN_SAFE_SDP_CONNECTION_NR[2] = 3 means that the control and status information of the F_SENDDP SPL connection that is parameterized via data record 2 can be found in the system variables with field index 3.

13334	SAFE_SDP_LADDR			N01, N10	FBSI	
-	Log. base address of the input/output data range F_SENDDP			DWORD	PowerOn	
-						
-	16	288, 288, 288, 288, 288, 288, 288, 288...	288	32767	7/2	M

Description: The logical base address of the input and output data range - parameterized in SIMATIC STEP 7 - through which this F_SENDDP connection communicates.
SIMATIC block parameter: LADDR

13335	SAFE_SDP_TIMEOUT			N01, N10	FBSI	
s	Monitoring time F_SENDDP			DOUBLE	PowerOn	
-						
-	16	0.5, 0.5, 0.5, 0.5, 0.5, 0.5, 0.5, 0.5...	0.0	60.0	7/2	M

Description: The monitoring time is the time in which F_SENDDP must have sent a new F telegram to F_RECVDP or in which F_RECVDP must have acknowledged a new F telegram. When the monitoring time is exceeded, F_RECVDP outputs replacement values to the SPL.
SIMATIC module parameter: TIMEOUT

13336	SAFE_SDP_ASSIGN			N01, N10	FBSI	
-	Output assignment \$A_OUTSE to F_SENDDP user data			DWORD	PowerOn	
-						
-	16	0, 0, 0, 0, 0, 0, 0, 0...	0	192192	7/2	M

2.3 NC machine data

Description: The SPL signals \$A_OUTSE to be transmitted into the F_SENDDP useful data can only be selected area by area.

The SPL area is specified in decimals in aaa bbb format

aaa = area limit 1, SPL signal \$A_OUTSE[aaa]

bbb = area limit 2, SPL signal \$A_OUTSE[bbb]

Example:

\$MN_SAFE_SDP_ASSIGN[0] = 001 004 or alternatively 004 001

The SPL signals \$A_OUTSE[1] to \$A_OUTSE[4] are transferred to the F_SENDDP user data selected in MD13337 \$MN_SAFE_SDP_FILTER[0].

13337	SAFE_SDP_FILTER			N01, N10	FBSI	
-	F user data filter between \$A_OUTSE and F_SENDDP			UDWORD	PowerOn	
-						
-	16	0xFFFF, 0xFFFF, 0xFFFF, 0xFFFF, 0xFFFF, 0xFFFF, 0xFFFF, 0xFFFF...	0x0	0xFFFF	7/2	M

Description: The SPL signals selected via MD13336 \$MN_SAFE_SDP_ASSIGN are transmitted to the F_SENDDP user data signals in the order of the FILTER bits set to 1. The lowest-value SPL signal to the bit position of the F_SENDDP user data of the lowest-value filter bit set to 1, etc. for all SPL signals selected.

Bit x = 1: an SPL signal is transmitted to bit position x of the F_SENDDP user data.

Bit x = 0: no SPL signal is transmitted to bit position x of the F_SENDDP user data.

13338	SAFE_SDP_ERR_REAC			N01, N10	FBSI	
-	Fault reaction F_SENDDP			DWORD	PowerOn	
-						
-	16	0, 0, 0, 0, 0, 0, 0, 0...	0	3	7/2	M

Description: In the case of a communication error the fault reaction defined here is triggered. This value is valid as long as no other value is specified from the SPL via system variable \$A_FSDP_ERR_REAC.

Meaning of the values:

- 0 = alarm 27350 + stop D/E
- 1 = alarm 27350
- 2 = alarm 27351 (displayed only; self-extinguishing)
- 3 = no system reaction

13340	SAFE_RDP_ENABLE_MASK			N01, N10	FBSI	
-	Enable screen F_RECVDP communication relationships			UDWORD	PowerOn	
-						
-	-	0x0	0x0	0xFFFF	7/2	M

Description: Enable screen for the individual F_RECVDP communication links and their SPL connections

13341	SAFE_RDP_ID			N01, N10	FBSI	
-	ID for F_RECVDP communication relationships			DWORD	PowerOn	
-						
-	16	0, 0, 0, 0, 0, 0, 0, 0...	-32768	32767	7/2	M

Description: Any network unique value as ID for F_RECVDP communication relationships.

SIMATIC module parameter: DP_DP_ID

13342	SAFE_RDP_NAME			N01, N10	FBSI	
-	Name of the F_RECVDP communication link			STRING	PowerOn	
-						
-	16	-	-	-	7/2	M

Description: A name can be assigned to each F_RECVDP communication link.
If a name was assigned, this name will be displayed in the alarm text instead of DP_DP_ID.

13343	SAFE_RDP_CONNECTION_NR			N01, N10	FBSI	
-	Number of the F_RECVDP-SPL connection			BYTE	PowerOn	
-						
-	16	0, 0, 0, 0, 0, 0, 0, 0...	0	16	7/2	M

Description: This machine data is used to set the number of the F_RECVDP SPL connection that is parameterized with this data record.
The number of the F_RECVDP SPL connection is also the index for access to the system variables of the user interface of this F_RECVDP SPL connection.
This applies to the following system variables:

- \$A_FRDP_SUBS
- \$A_FRDP_ERR_REAC
- \$A_FRDP_ERROR
- \$A_FRDP_SUBS_ON
- \$A_FRDP_ACK_REQ
- \$A_FRDP_DIAG
- \$A_FRDP_SENDDP

Example:
MD13343 \$MN_SAFE_RDP_CONNECTION_NR[2] = 3 means that the control and status information of the F_RECVDP SPL connection that is parameterized in data record 2 can be found in the system variables with field index 3.

13344	SAFE_RDP_LADDR			N01, N10	FBSI	
-	Log. base address of the input/output data range F_RECVDP			DWORD	PowerOn	
-						
-	16	288, 288, 288, 288, 288, 288, 288, 288...	288	32767	7/2	M

Description: The logical base address of the input and output data range - parameterized in SIMATIC STEP 7 - through which this F_RECVDP connection communicates.
SIMATIC block parameter: LADDR

13345	SAFE_RDP_TIMEOUT			N01, N10	FBSI	
s	Monitoring time F_RECVDP			DOUBLE	PowerOn	
-						
-	16	0.5, 0.5, 0.5, 0.5, 0.5, 0.5, 0.5, 0.5...	0.0	60.0	7/2	M

Description: The monitoring time is the time in which F_SENDDP must have sent a new F telegram to F_RECVDP or in which F_RECVDP must have acknowledged a new F telegram. When the monitoring time is exceeded, F_RECVDP outputs replacement values to the SPL.
SIMATIC module parameter: TIMEOUT

2.3 NC machine data

13346	SAFE_RDP_ASSIGN			N01, N10	FBSI	
-	Input assignment F_RECVDP user data to \$A_INSE			DWORD	PowerOn	
-						
-	16	0, 0, 0, 0, 0, 0, 0, 0...	0	192192	7/2	M

Description:

The SPL signals \$A_INSE to be supplied from the F_RECVDP useful data can only be selected area by area.

The SPL area is specified in decimals in aaa bbb format

aaa = area limit 1, SPL signal \$A_INSE[aaa]

bbb = area limit 2, SPL signal \$A_INSE[bbb]

Example:

\$MN_SAFE_RDP_ASSIGN[0] = 001 004 or alternatively 004 001

The F_RECVDP user data selected in MD13347 \$MN_SAFE_RDP_FILTER[0] are transferred to the SPL signals \$A_INSE[1] to \$A_INSE[4].

13347	SAFE_RDP_FILTER			N01, N10	FBSI	
-	F user data filter between F_RECVDP and \$A_INSE			UDWORD	PowerOn	
-						
-	16	0xFFFF, 0xFFFF, 0xFFFF, 0xFFFF, 0xFFFF, 0xFFFF, 0xFFFF, 0xFFFF...	0x0	0xFFFF	7/2	M

Description:

The F_RECVDP user data signals the filter bits of which are set to 1 are transmitted to the SPL signals via MD13346 \$MN_SAFE_RDP_ASSIGN. The lowest-value F_RECVDP user data signal to the lowest-value selected SPL signal etc. for all F_RECVDP user data selected.

Bit x = 1: the F_RECVDP user data signal of bit position x is transmitted as SPL signal.

Bit x = 0: the F_RECVDP user data signal of bit position x is not transmitted as SPL signal.

13348	SAFE_RDP_ERR_REAC			N01, N10		FBSI	
-	Fault reaction F_RECVDP			DWORD		PowerOn	
-							
-	16	0, 0, 0, 0, 0, 0, 0, 0...	0	3	7/2	M	

Description:

In the case of a communication error, the fault reaction defined here is triggered. This value is valid as long as no other value is specified from the SPL via system variable \$A_FRDP_ERR_REAC.

Meaning of the values:

- 0 = alarm 27350 + stop D/E
- 1 = alarm 27350
- 2 = alarm 27351 (displayed only; self-clearing)
- 3 = no system reaction

13349	SAFE_RDP_SUBS			N01, N10	FBSI	
-	Replacement values in case of error			UDWORD	PowerOn	
-						
-	16	0, 0, 0, 0, 0, 0, 0, 0...	0	0xFFFF	7/2	M

Description:

In the case of a communication error, the replacement values defined here are activated in the system variables \$A_INSE assigned to this F_RECVDP-SPL connection. This value is valid as long as no other value is specified from the SPL via system variable \$A_FRDP_SUBS.

13370	SAFE_MODE			N01	FBSI	
-	Safety operating mode			UBYTE	PowerOn	
-						
-	-	0	0x00	0x03	7/2	M

Description: MD to make a distinction between the safety operating modes:
 0 = Safety operating mode "SINUMERIK Safety Integrated (SPL) "
 1 = Safety operating mode "SINUMERIK Safety Integrated (Drive Based) "
 2 = Reserved
 3 = Safety operating mode "SINUMERIK Safety Integrated plus (F-PLC) "
 3 = Safety operating mode "SINUMERIK Safety Integrated (F-PLC) "

13372	SAFE_PS_DRIVE_LOGIC_ADDR			N01, N04	-	
-	Logical basis addresses, PROFIsafe drive			DWORD	PowerOn	
-						
-	31	1008, 992, 976, 960, 944, 928, 912, 896...	0	16383	7/2	M

Description: Logical basis addresses for PROFIsafe communication between the F-PLC and drive.

13374	SAFE_INFO_DRIVE_LOGIC_ADDR			N01, N04	-	
-	Logical basis addresses, SIC/SCC			DWORD	PowerOn	
-						
-	31	5800, 5816, 5832, 5848, 5864, 5880, 5896, 5912...	0	16383	7/2	M

Description: Logical base addresses for SIC/SCC communication between NCK and drive.
 The standard values of the logical base addresses correspond to the values from the S7 default configuration.

13376	SAFE_INFO_TELEGRAM_TYPE			N01, N04	-	
-	SIC/SCC telegram type			DWORD	PowerOn	
-						
-	31	701, 701, 701, 701, 701, 701, 701, 701...	0	999	7/2	M

Description: Number of the SIC/SCC telegram type

14504	MAXNUM_USER_DATA_INT			N03	P3	
-	Number of user data (INT)			DWORD	PowerOn	
-						
-	-	0	0	256	7/2	M

Description: Number of NC/PLC user data of type INT

14506	MAXNUM_USER_DATA_HEX			N03	P3	
-	Number of user data (HEX)			DWORD	PowerOn	
-						
-	-	0	0	256	7/2	M

Description: Number of NC/PLC user data (HEX)

2.3 NC machine data

14508	MAXNUM_USER_DATA_FLOAT			N03	P3	
-	Number of user data (FLOAT)			DWORD	PowerOn	
-						
-	-	0	0	64	7/2	M

Description: Number of NC/PLC user data of type FLOAT

14510	USER_DATA_INT			N03	P3, "PLC-Maschinendaten", P4, "PLC-Maschinendaten"	
-	User data (INT)			DWORD	PowerOn	
-						
-	256	0, 0, 0, 0, 0, 0, 0, 0...	-32768, -32768, -32768, -32768, -32768, -32768, -32768, -32768...	32767, 32767, 32767, 32767, 32767, 32767, 32767, 32767...	7/2	I

Description: User data can be read from the DB20 (user data block) in the PLC user program.

14512	USER_DATA_HEX			N03	P3, "PLC-Maschinendaten", P4, "PLC-Maschinendaten"	
-	User data (HEX)			UDWORD	PowerOn	
-						
-	256	0, 0, 0, 0, 0, 0, 0, 0...	0	0x0FF	7/2	I

Description: User data can be read from the DB20 (user data block) in the PLC user program.

14514	USER_DATA_FLOAT			N03	P3, "PLC-Maschinendaten", P4, "PLC-Maschinendaten"	
-	User data (FLOAT)			DOUBLE	PowerOn	
-						
-	64	0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0...	-3.40e38	3.40e38	7/2	I

Description: User data can be read from the DB20 (user data block) in the PLC user program.

15700	LANG_SUB_NAME			N01	K1	
-	Name for substitution subroutine			STRING	PowerOn	
-						
-	-	-	-	-	7/2	M

Description: Name of the user program called on the basis of a substitution configured by MD30465 \$MA_AXIS_LANG_SUB_MASK.

The user program is called with the path configured by MD15702 \$MN_LANG_SUB_PATH.

15702	LANG_SUB_PATH			N01	K1	
-	Call path for substitution subroutine			BYTE	PowerOn	
-						
-	-	0	0	2	7/2	M

Description: Path with which the user program set by MD15700 \$MN_LANG_SUB_NAME is called on the basis of a substitution configured by MD30465 \$MA_AXIS_LANG_SUB_MASK:

0: /_N_CMA_DIR (default)
 1: /_N_CUS_DIR
 2: /_N_CST_DIR

15710	TCA_CYCLE_NAME			N09	K1, FBWsl	
-	Program name for replacement of the TCA command			STRING	PowerOn	
-						
-	-	-	-	-	7/2	M

Description: Program name for the replacement program when calling the TCA command.

If the TCA command is programmed in a part program block, then the subprogram defined in MD15710 \$MN_TCA_CYCLE_NAME is called at the end of the block. The programmed tool can be requested in the replacement program via the system variables \$C_TS_PROG / \$C_TS, the Duplo number via \$C_DUPLO_PROG / \$C_DUPLO and the toolholder/spindle number via \$C_THNO_PROG / \$C_THNO. The system variable \$C_TCA returns the value TRUE in the replacement program. Since the replacement takes place at the end of the block, the system variable \$P_SUB_STAT in the replacement program provides the value 2

If MD15710 \$MN_TCA_CYCLE_NAME contains an empty string, the replacement is deactivated (default).

16501	CADAPT_MODE			EXP, N01	-	
-	Activation behavior of the adaptation table			BYTE	PowerOn	
-						
-	100	0, 0, 0, 0, 0, 0, 0, 0...	0	2	1/1	M

Description: Activation detection of the CADAPT adaptation table

Value 0 = Adaptation table is inactive

Value 1 = Adaptation table is permanently active

Value 2 = Adaptation table can be activated and deactivated temporarily by part program

16502	CADAPT_INPUT			EXP, N01	-	
-	Input variable for adaptation table			BYTE	PowerOn	
-						
-	100	1, 1, 1, 1, 1, 1, 1...	1	3	1/1	M

Description: Selection of the input variable for the adaptation table

Value 1 = input value (moment of inertia for the mass) for the load adaptation

Value 2 = input value (axis position) for the position adaptation

Value 3 = input value (axis velocity or speed) for the speed adaptation

16503	CADAPT_OUTPUT			EXP, N01	-	
-	Output variable for adaptation table			BYTE	PowerOn	
-						
-	100	0, 0, 0, 0, 0, 0, 0, 0...	0	36	1/1	M

Description: Selection of the output variable of the adaptation table for dynamic or control parameters

Value 0 = no output variable no adaptation effective

Value 1 = axis acceleration DYNORM

Value 2 = axis acceleration DYNPOS

Value 3 = axis acceleration DYNROUGH

Value 4 = axis acceleration DYNSEMIFIN

Value 5 = axis acceleration DYNFINISH

Value 6 = axis acceleration DYNPREC

Value 11 = Position controller gain

Value 12 = Moment of inertia or mass of the torque feedforward control

Value 21 = adaptation factor ADAPT1 for drive parameters

Value 22 = adaptation factor ADAPT2 for drive parameters

2.3 NC machine data

Value 23 = adaptation factor ADAPT3 for drive parameters

Value 24 = adaptation factor ADAPT4 for drive parameters

Wert 31 = axis jerk DYNORM

Wert 32 = axis jerk DYNPOS

Wert 33 = axis jerk DYNROUGH

Wert 34 = axis jerk DYNSEMIFIN

Wert 35 = axis jerk DYNFINISH

Wert 36 = axis jerk DYNPREC

16504	CADAPT_INPUT_AX	EXP, N01	-
-	Machine axis number of the input variable	BYTE	PowerOn
-			
-	100	0, 0, 0, 0, 0, 0, 0, 0...	0 31 1/1 M

Description: Value = 0: no machine axis assigned, adaptation table is inactive
Value > 0: machine axis number for the input variable of the adaptation table

16505	CADAPT_OUTPUT_AX	EXP, N01	-
-	Machine axis number of the output variable	BYTE	PowerOn
-			
-	100	0, 0, 0, 0, 0, 0, 0, 0...	0 31 1/1 M

Description: Value = 0: no machine axis assigned, adaptation table is inactive
Value > 0: machine axis number for the output variable of the adaptation table

16506	CADAPT_INPUT_VALUE_1	EXP, N01	-
-	Input value 1 of the adaptation table	DOUBLE	NEW CONF
-			
-	100	0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0...	-MD_DBLMAX 1.0E+301 1/1 M

Description: Input value 1 of the adaptation table

16507	CADAPT_INPUT_VALUE_2	EXP, N01	-
-	Input value 2 of the adaptation table	DOUBLE	NEW CONF
-			
-	100	0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0...	-MD_DBLMAX 1.0E+301 1/1 M

Description: Input value 2 of the adaptation table

16508	CADAPT_OUTPUT_VALUE_1	EXP, N01	-
-	Output value 1 of the adaptation table	DOUBLE	NEW CONF
-			
-	100	1.0, 1.0, 1.0, 1.0, 1.0, 1.0, 1.0, 1.0...	0.0 30.0 1/1 M

Description: Output value 1 of the adaptation table

16509	CADAPT_OUTPUT_VALUE_2	EXP, N01	-
-	Output value 2 of the adaptation table	DOUBLE	NEW CONF
-			
-	100	1.0, 1.0, 1.0, 1.0, 1.0, 1.0, 1.0, 1.0...	0.0 30.0 1/1 M

Description: Output value 2 of the adaptation table

16800	ROOT_KIN_ELEM_NAME	EXP, N01	K1
-	Name of the root chain element	STRING	Reset
-			
-	-	ROOT	-
-	-	-	-
-	-	7/2	M

Description: Specifies the name of the chain element, which, for a machine description using kinematic chains, is the only one that extends from the zero point of the global coordinate system (root chain element).

16900	COLLISION_EXT_FUNCTION_MASK	EXP	-
-	Parameterization of external collision check	UDWORD	PowerOn
-			
-	-	0	0
-	-	0xF	7/2
-	-	M	

Description: Bit mask for parameterization of external collision check

16901	COLLISION_EXT_PREVIEW_TIME	EXP	-
s	Preview time for external collision check	DOUBLE	PowerOn
-			
-	-	0.0	0.000
-	-	100.0	7/2
-	-	M	

Description: The time applies during operation provided that enough data is available for a prediction. When a movement is started, the movement preview starts at the current position, and returns predictions in the largest possible increments until the preview time is reached.

16902	COLLISION_EXT_PREVIEW_STEP	EXP	-
s	Preview time step for external collision check	DOUBLE	PowerOn
-			
-	-	0.0	0.000
-	-	100.0	7/2
-	-	M	

Description: When a movement is started, the movement preview starts at the current position, and returns predictions in the configured increment until the preview time COLLISION_EXT_PREVIEW_TIME is reached.

16903	COLLISION_EXT_TIMEOUT	EXP	-
s	Timeout for external collision check	DOUBLE	PowerOn
-			
-	-	0.0	0.000
-	-	100.0	7/2
-	-	M	

Description: Timeout for communication with an external system to avoid collisions.

16904	COLLISION_EXT_STOP_TIME	EXP	-
s	Maximum braking time for external collision avoidance	DOUBLE	PowerOn
-			
-	-	0.0	0.000
-	-	100.0	7/2
-	-	M	

Description: If the external collision avoidance triggers a stop, the machine must come to a standstill within the set time (identical to response to STOP D).

16905	COLLISION_EXT_NUM_PACKETS	EXP	-
-	Number of preview packages per Ipo cycle	UDWORD	PowerOn
-			
-	-	1	1
-	-	100	7/2
-	-	M	

Description: For each Ipo cycle, a package with current positions and the configured number of preview packages is created.

2.3 NC machine data

16906	COLLISION_EXT_CFG_MASK			EXP	-	
-	Parameterization of external collision check			UDWORD	Reset	
-						
-	-	0x1	0	0x1	7/2	M

Description: Bit mask for parameterization of external collision check

17000	EXTENSIONS_OF_BIN_FILES			EXP	-	
-	Extensions of binary files			STRING	PowerOn	
-						
-	20	JPG, GIF, PNG, BMP, PDF, ICO, HTM, CLC	-	-	2/2	M

Description: Extensions of files which are saved in the binary format in the passive NCKs file system.
 For these files, there are no restrictions regarding the content.
 For ASCII content (e.g. HTM) any line length is possible; this is not permissible for NC programs (e.g. MPF, SPF and DEF).
 Each extension must comprise precisely three uppercase letters.

17400	OEM_GLOBAL_INFO			A01, A11	-	
-	OEM version information			STRING	PowerOn	
-						
-	5	-	-	-	7/2	I

Description: A version information freely available to the user
 (is indicated in the version screen)
 Note: MD17400 \$MN_OEM_GLOBAL_INFO[0] is used with functions such as logbook, licensing, etc. to store the machine identity.

17500	MAXNUM_REPLACEMENT_TOOLS			N09	FBWsl	
-	Maximal number of tools in a tool group			DWORD	PowerOn	
-						
-	-	0	0	1500	7/2	M

Description: Only relevant if the tool management (TMMA) function or the tool monitoring function (TMMO) is active.
 Maximum number of tools which have the same value (tool name) for system parameter \$TC_TP2.
 0: There is no monitoring, that is there can be any number of tools in a group.
 1: There can only be exactly 1 tool with one specific tool name.
 2: There can only be exactly 2 tools with one specific tool name, therefore there can be 1 replacement tool.
 n: There can only be exactly n tools with one specific tool name, therefore there can be n-1 replacement tools.
 Related to:
 MD18080 \$MN_MM_TOOL_MANAGEMENT_MASK,
 MD20310 \$MC_TOOL_MANAGEMENT_MASK

17504	MAX_TOOLS_PER_MULTITOOL			N02, N09	-	
-	Multitool function. Maximum number of tool locations per multitool.			DWORD	PowerOn	
-						
-	-	6	2	72	1/1	M

Description: "Multiple tools in one magazine location" function (multitool). Maximum number of locations / tools per multitool.

17510	TOOL_UNLOAD_MASK			N09	FBWsl	
-	Behavior of tool data when unloading			UDWORD	PowerOn	
-						
-	-	0	0	0xF	7/2	M

Description: When unloading a tool, certain tool data can be set to store fixed values.

Bit no.	Bit value	HEX	Meaning
0	0		Tool status 'active' remains unchanged.
1	0x1		Tool status 'active' is deleted (\$TC_TP8, Bit 0).
1	0		Tool status 'was in use' remains unchanged.
1	0x2		Tool status 'was in use' is deleted (\$TC_TP8, Bit 7).
2	0		Tool parameter \$TC_TP10 remains unchanged.
1	0x4		Tool parameter \$TC_TP10 is set to zero. That is, the tool replacement change strategy is reset.
3	0		Tool parameter \$TC_TP11 remains unchanged.
1	0x8		Tool parameter \$TC_TP11 is set to zero. That is, the assignment to the tool subgroup is resolved.

17515	TOOL_RESETMON_MASK			N09	-	
-	Tool data behavior with RESETMON			UDWORD	PowerOn	
-						
-	-	0x14	0	0x49F	7/2	M

Description: The 5th parameter of the RESETMON command defines which tool status is to be reset. If the 5th parameter is omitted, it is replaced by the value in this MD. With the PI service "_N_TRESMON", work is always done with this value.

In that case, the bits are always assigned as the bits in the tool status \$TC_TP8[x].

Bit no.: 0	Bit value: 0	hex value: -	Meaning: Tool status "active" remains unchanged
Bit no.: 0	Bit value: 1	hex value: 'H1'	Meaning: Tool status "active" is deleted
Bit no.: 1	Bit value: 0	hex value: -	Meaning: Tool status "released" remains unchanged
Bit no.: 1	Bit value: 1	hex value: 'H2'	Meaning: Tool status "released" is set
Bit no.: 2	Bit value: 0	hex value: -	Meaning: Tool status "locked" remains unchanged
Bit no.: 2	Bit value: 1	hex value: 'H4'	Meaning: Tool status "locked" is deleted, if this is permitted by the monitoring data and the 4th parameter is set correspondingly.
Bit no.: 3	Bit value: 0	hex value: -	Meaning: Tool status "measure" remains unchanged
Bit no.: 3	Bit value: 1	hex value: 'H8'	Meaning: Tool status "measure" is set.
Bit no.: 4	Bit value: 0	hex value: -	Meaning: Tool status "prewarning limit" remains unchanged
Bit no.: 4	Bit value: 1	hex value: 'H10'	Meaning: Tool status "prewarning limit" is deleted, if this is permitted by the monitoring data and the 4th parameter is set.

2.3 NC machine data

Bit no.: 5 Not permitted (tool status "tool is being changed")
 Bit no.: 6 Not permitted (tool status "tool is fixed-location-coded")
 Bit no.: 7 Bit value: 0 hex value: -
 Meaning: Tool status "was in use" remains unchanged
 Bit no.: 7 Bit value: 1 hex value: 'H80'
 Meaning: Tool status "was in use" is deleted
 Bit no.: 8 Bit value: 0 Not permitted (tool status "is in retract")
 Bit no.: 9 Bit value: 0 hex value: -
 Meaning: Tool status "locked is ignored" remains unchanged
 Bit no.: 9 Bit value: 1 hex value: 'H200'
 Meaning: Tool status "locked is ignored" is deleted
 Bit no.: 10 Bit value: 0 hex value: -
 Meaning: Tool status "to unload" remains unchanged
 Bit no.: 10 Bit value: 1 hex value: 'H400'
 Meaning: Tool status "to unload" is deleted
 Bit no.: 11 Not permitted (tool status "to load")
 Bit no.: 12 Bit value: 0 Not permitted (tool status "master tool")
 Bit no.: 13 Not permitted (reserved)
 The default setting corresponds to the previous behavior.
 Impermissible bits are filtered and not displayed in the limit mask.
 Bits not defined here are ignored when writing the machine data.

17520	TOOL_DEFAULT_DATA_MASK			N09	FBWsl	
-	Create new tool: default settings			UDWORD	PowerOn	
-						
-	-	0	0	0x1F	7/2	M

Description:

When defining a tool for the first time (bits 0, 1, 2) or the magazine locations (bit 3) for the first time, certain data of the tool can be set to fixed default values. Bit 4 can couple the magazine location status 'Overlapping allowed' ('H2000') to the value of the magazine location status 'disabled' ('H1'). This can prevent simple applications from dealing with data which do not necessarily have to be assigned individual values.

Bit no.: 0 Bit value: 0 Hex value: -

Meaning: Default value of tool status (\$TC_TP8), bit1=0 ='not released'

Bit no.: 0 Bit value: 1 Hex value: 'H1'

Meaning: Default value of tool status (\$TC_TP8), bit1=1 ='released'

Bit no.: 1 Bit value: 0 Hex value: -

Meaning: Default value of tool status (\$TC_TP8), bit6=0 ='not fixed-location-coded'

Bit no.: 1 Bit value: 1 Hex value: 'H2'

Meaning: Default value of tool status (\$TC_TP8), bit6=1 ='fixed-location-coded'

Bit no.: 2 Bit value: 0 Hex value: -

Meaning: The tool is only accepted in the tool group when the explicit write command is used for the tool name. Only then can it be loaded via programming.

Bit no.: 2 Bit value: 1 Hex value: 'H4'

Meaning: The tool is automatically accepted in the tool group corresponding to the tool name when it is defined for the first time. The tool can then be changed using the default name ("t" = t-No.).

The term 'tool name' (\$TC_TP2) can be hidden from the user. (This only makes sense if you do not use replacement tools or if the tool name is not written explicitly, as this may give rise to data consistency problems.)

Bit no.: 3 Bit value: 0 Only with TMMG: Default value of location type (\$TC_TP7)=9999=not defined

Bit no.: 3 Bit value: 1 Hex value: 'H8'

Meaning: Only with TMMG: Default value of location type (\$TC_TP7) = 1 and consequently the default value of magazine location type (\$TC_MPP2)=1. This means that all magazine locations can accept all tools.

Bit no.: 4 Bit value: 0 Hex value: -

Meaning: Only with TMMG + active consider adjacent location: With SET/RESET of the magazine location status 'disabled', the magazine location status 'Overlapping allowed' remains unchanged.

Bit no.: 4 Bit value: 1 Hex value: 'H10'

Meaning: Only with TMMG + active consider adjacent location: With SET/RESET of the magazine location status 'disabled', the magazine location status 'Overlapping allowed' is automatically SET/RESET.

17530	TOOL_DATA_CHANGE_COUNTER			EXP, N01	-	
-	Mark tool data change for HMI			UDWORD	PowerOn	
-						
-	-	0x1F	0	0x3F	7/2	M

Description:

HMI display support. This data enables individual data to be explicitly taken into account or not taken into account in the OPI variables (block C/S) toolCounter, toolCounterC, toolCounterM.

Bit no. : 0 Bit value: 0 Hex value: -

Meaning: Changes to the values of the tool status (\$TC_TP8) are not taken into account in toolCounterC

Bit no. : 0 Bit value: 1 Hex value: 'H1'

Meaning: Changes to the values of the tool status (\$TC_TP8) are taken into account in toolCounterC

Bit no. : 1 Bit value: 0 Hex value: -

Meaning: Changes to the values of the remaining number of tools (\$TC_MOP4) are not taken into account in toolCounterC

Bit no. : 1 Bit value: 1 Hex value: 'H2'

Meaning: Changes to the values of the remaining number of tools (\$TC_MOP4) are taken into account in toolCounterC

Bit no. : 2 Bit value: 0 Hex value: -

Meaning: Changes to the values of the tool data are not taken into account in the tool data update service

Bit no. : 2 Bit value: 1 Hex value: 'H4'

Meaning: Changes to the values of the tool data are taken into account in the tool data update service

Bit no. : 3 Bit value: 0 Hex value: -

Meaning: Changes to the values of the magazine data are not taken into account in the tool data update service

Bit no. : 3 Bit value: 1 Hex value: 'H8'

Meaning: Changes to the values of the magazine data are taken into account in the tool data update service.

Bit no. : 4 Bit value: 0 Hex value: -

Meaning: Changes to the values of the ISO tool offset data are not taken into account in the tool data update service

Bit no. : 4 Bit value: 1 Hex value: 'H10' Meaning: Changes to the values of the ISO tool offset data are taken into account in the tool data update service

Bit no.: 5 Bit value: 0 Hex value: -

2.3 NC machine data

Meaning: Changes to the value of adapter type1 are stated as changes of the T/AD and T/ADN blocks.

Bit no.: 5 Bit value: 1 Hex value: 'H20' Changes to the value of adapter type1 are stated as changes of the T/ADN block only..

The statements "Changes to the values of the tool status" and "Changes to the values of the remaining number of tools" refer not only to value changes effected by internal processes in the NC but also to value changes produced by writing the corresponding system variables.

17540	TOOLTYPES_ALLOWED			N09	-	
-	Permitted tool types			UDWORD	PowerOn	
-						
-	-	0x3FF	0	0x3FF	7/2	M

Description:

Definition of the tool types permitted in NCK (see \$TC_DP1) with the tool offset selection. That is, tools of any type may be loaded in the NCK; but only the tools types defined here may be defined in the offset defining tool. A bit value = 1 means that the named tool type range is permitted for the offset selection. A bit value = 0 means that the named tool type range is rejected with an offset-capable alarm in the case of an attempted offset selection of a cutting edge of this type. The special value = 0, 9999 for the tool type means "undefined". Tool offsets with this tool type value generally cannot be selected.

Bit no.: 0 value 0x1 means: Tool types 1 to 99 permitted

Bit no.: 1 value 0x2 means: Tool types 100 to 199 permitted (milling tools)

Bit no.: 2 value 0x4 means: Tool types 200 to 299 permitted (drilling tools)

Bit no.: 3 value 0x8 means: Tool types 300 to 399 permitted

Bit no.: 4 value 0x10 means: Tool types 400 to 499 permitted (grinding tools)

Bit no.: 5 value 0x20 means: Tool types 500 to 599 permitted (turning tools)

Bit no.: 6 value 0x40 means: Tool types 600 to 699 permitted

Bit no.: 7 value 0x80 means: Tool types 700 to 799 permitted

Bit no.: 8 value 0x100 means: Tool types 800 to 899 permitted

Bit no.: 9 value 0x200 means: Tool types 900 to 999 permitted

MD18100 \$MN_MM_NUM_CUTTING_EDGES_IN_TOA

17600	DEPTH_OF_LOGFILE_OPT			EXP, N01	-	
-	Depth of log memory optimization in REORG			DWORD	Reset	
-						
-	-	5	0	300	3/3	U

Description:

The depth of memory optimization in the REORG log file

(=search depth to determine if a parameter to be written is already included in the REORG log file).

The value of the machine data can be increased if alarm 15110 occurs during program execution and if this alarm is to be avoided.

(Alternatively, the size of the REORG log file can be increased with MD28000 \$MC_MM_REORG_LOG_FILE_MEM, provided that the operator has the access rights required. This procedure should generally be preferred.)

Value

0 = No optimization,

That is each write operation creates an input into the REORG log file. Writing a variable value is therefore very time-efficient, but requires more memory.

0 < n <= Maximum value

When a new variable value is written, the n previously entered write operations (but maximally up to the previous indicatable block) are checked to determine if the parameter now to be written has already been written in the past. If this is the case, a new entry is not made in the REORG log file.

If this is not the case, an entry is made. A variable value can therefore be written in a very memory-efficient way, but requires more time.

Example:

MD17600 \$MN_DEPTH_OF_LOGFILE_OPT is assumed to be 5 and the following would be a typical program sequence:

```
x10      ; Executable NC block
r1=1     ; The first write command since x10
          ; -> Save old value in log file. 1st entry
r2=1     ; Determine that r2 is not yet included
          ; -> Save old value in log file. 2nd entry
r3=1     ; Determine that r3 is not yet included
          ; -> Save old value in log file. 3rd entry
r4=1     ; Determine that r4 is not yet included
          ; -> Save old value in log file. 4th entry
r5=1     ; Determine that r5 is not yet included
          ; -> Save old value in log file. 5th entry
r6=1     ; Determine that r6 is not yet included
          ; -> Save old value in log file. 6th entry
r2=1     ; Determine that r2 is already included
          ; (5th oldest entry) -> no renewed saving
r3=1     ; Determine that r3 is already included
          ; (4th oldest entry) -> no renewed saving
r1=2     ; As MD17600 $MN_DEPTH_OF_LOGFILE_OPT = 5 it is not detected that
          ; r1 is already included
          ; (6th oldest entry) -> save old value in log file.
          ; 7th entry

x20      ; Executable NC block
r1=3     ; The first write command since x20
          ; -> Save old value in log file. 1st entry
r1=4     ; Determine that r1 is already included
          ; (Only one entry) -> no renewed saving
```

The setting of the MD is particularly useful if a small number of various parameters are written frequently (e.g. in a loop) and if alarm 15110 occurs for this reason.

17610	DEPTH_OF_LOGFILE_OPT_PF			EXP, N01	-	
-	Depth of the PowerFail log memory optimization			DWORD	Reset	
-						
-	3	100, 10, 30	0	1000	1/1	M

Description: Depth of the memory optimization in the PowerFail log file (=search depth, to find out whether a parameter to be written is already included in the PowerFail log file). It is possible to increase the value of the machine data if alarm 15120 occurs during program processing and if you wish to avoid it. (Alternatively, you can increase the size of the PowerFail log file itself by means of MD18232 \$MN_MM_ACTFILESYS_LOG_FILE_MEM, if you have the necessary access right and if the required memory is available.

2.3 NC machine data

Value

0 = same effect as value 1.

Writing of a variable value is therefore very time-efficient at the cost of the required memory.

0 < n <= Maximum value

= Writing of a new variable value leads, prior to saving of the new variable value in the PowerFail log file, to the last n write operations which have been being checked to see whether the new parameter to be written has already been written once.

If yes, the new value is not entered again in the PowerFail log file, but the old value is overwritten with the new one.

If no, the new value is entered.

At the cost of the required time, writing of a variable value can therefore be designed very memory-efficiently.

Changing of the data can shorten/increase the time requirement of the present application.

Changing of the data can fill the available log buffers faster/more slowly.

Frequent occurring of alarm 15120 -> Increase values for index=0,1,2.

The value indicating the index to be changed can be deducted from the parameter of alarm 15120:

if it is the value for MD18232 \$MN_MM_ACTFILESYS_LOG_FILE_MEM[0], then increase the value for index 0;

or increase MD18232 \$MN_MM_ACTFILESYS_LOG_FILE_MEM[0] itself.

Index Meaning

0 Search depth in preprocessing buffer

1 Search depth in buffer for data changes within the range of tool change

2 Search depth in buffer for data changes of main processing (especially synchronized actions)

17900	VDI_FUNCTION_MASK			EXP, N09	H1	
-	Setting to VDI signals			UDWORD	PowerOn	
-						
-	-	0x0	0	0x1	7/2	M

Description:

Settings for VDI signals:

Bit 0 == 0:

The VDI signals traverse command + / traverse command - are already issued if there is a traverse request (default).

Bit 0 == 1:

The VDI signals traverse command + / traverse command - are issued only if the axis actually traverses.

Bit 1 == 0:

The VDI interface is written to the NCK at the end of the IPO cycle.

Bit 1 == 1:

The VDI interface is written to the NCK at the start of the IPO cycle.

17950	IS_AUTOMATIC_MEM_RECONFIG			EXP, N02	-	
-	System: automatic memory reconfiguration			BOOLEAN	PowerOn	
-						
-	-	TRUE	-	-	3/1	M

Description:

Value = 0 : If machine data that redefines the buffered memory is modified, then generally the alarm 4400 is output which indicates that the user data will be deleted the next the software is started.

Value = 1 : If machine data that redefines the buffered memory is modified, then generally the alarm 4400 is not output. This means the data is retained the next time the software is started.

The preassigned value is selected model-specifically and generally it must not be changed.

17951	AUTOMATIC_MEM_RECONFIG_FILE			EXP	-	
-	Path and file name for internal data backup			STRING	PowerOn	
-						
-	-	/siemens/sinumerik/ sys_cache/nck/ content.reconfig	-	-	ReadOnly	S

Description: File name with file path where the data backup file is stored if the persistent memory is reconfigured.

18030	HW_SERIAL_NUMBER			N05	-	
-	Hardware series number			STRING	PowerOn	
-						
-	1	-	-	-	ReadOnly	M

Description: During power on of the control, a unique hardware serial number is stored in this MD:

- For Powerline series modules this is the serial number of the NCU module
- For Solutionline series modules this is the serial number of the CF card, or the unique number of the MCI module in the case of PC-based systems

This data cannot be written.

18040	VERSION_INFO			N05	-	
-	Version and product information			STRING	PowerOn	
-						
-	9	-	-	-	ReadOnly	M

Description: Version and model information for the system software component NCK

[0]:'Software component name[SI version]' - value: "Numeric Control NCK" (can be overwritten as from "trol NCK" with 'SIxxx'. 'SI' stands for Safety Integrated, 'xxx' for the SI version)

[1]:'Version (and date of the NCK installation on the target system)'

[2]:'Date and time of the NCK program generation'

[3]:'Name of the model and submodel' - values: 808d-me42, ... 828d-me42, ... 840DSL731,... 840D732, ...

[4]:'Hardware type' - values for NCK in NCU: IDC, SOC2, ... simulations NCK: PC (Windows), PC (Linux), ... HOST development NCK: HOST development

[5]:'Product type' - values: machine tool, simulation, simulation development

[6]:'Subscaling 1' - values: file name. different variants of a model can have data (properties) deviating from those of the model.

[7]:'Subscaling 2' - values: file name. different variants of a model can have data (properties) deviating from those of the model.

[8]:'Subscaling 3' - values: file name. different variants of a model can have data (properties) deviating from those of the model.

Applies to indices 6,7,8: Prerequisite for a value input is that the file exists when the NCK starts.

2.3 NC machine data

Example for 840dsl on NCU hardware:

```
[0]: "Numeric Control NCK" (without NC-based Safety Integrated)
[0]: "Numeric ControSI112" (with NC-based Safety Integrated)
[1]: "112.00.00 "
[2]: "22/02/16 09:28:03"
[3]: "840DSL731"
[4]: "SOC2"
[5]: "machine tool"
[6]: ""
[7]: ""
[8]: ""
```

Example for '840d virtual commissioning' (a simulation product) on a Windows computer:

```
[0]: "Numeric Control NCK" (without Safety Integrated)
[1]: "112.00.00"
[2]: "31/01/16 08:58:43"
[3]: "840D732"
[4]: "PC (Windows)"
[5]: "simulation"
[6]: "840evoVC_addon"
[7]: ""
[8]: ""
```

18042	CC_VERSION_INFO			N05	-	
-	Compile cycle version			STRING	PowerOn	
-

Description: Version identifiers of the compile cycles

18045	EES_MODE_INFO			N05	-	
-	Mode in which the EES function works.			BYTE	Immediately	
-						
-	-	0	-	-	ReadOnly	M

Description: Mode in which the function "Execution from External Storage" works.

Bit0 (LSB) = 1

CNC user memory expanded (local EES active)

Bit1 = 1

Execution from external memory (global EES is active)

Bit2 = 1

A global part program memory has been set up on an external memory.

See also:

OD19730 \$ON_HMI_FUNCTION_MASK[0] bit 5 "CNC user memory expanded"

OD19334 \$ON_SYSTEM_FUNCTION_MASK bit 9 "Execute from external memory"

OD19334 \$ON_SYSTEM_FUNCTION_MASK bit 12 "Additional HMI user memory on CF card of the NCU"

18050	INFO_FREE_MEM_DYNAMIC			N01, N02, N05	S7	
-	Display data of the free volatile memory (bytes)			DWORD	PowerOn	
-						
840dsl-71	-	12582912	0	36490445	ReadOnly	S

840dsl-72	-	8808039	0	36490445	ReadOnly	S
840dsl-73	-	8808039	0	36490445	ReadOnly	S
840dsl-711	-	48234496	0	36490445	ReadOnly	S
840dsl-721	-	23068672	0	36490445	ReadOnly	S
840dsl-731	-	36490445	0	36490445	ReadOnly	S

Description:

The data is used for

- a) the manufacturer's presetting of the memory size [bytes] available to the user for each channel after cold restart.
- b) displaying the available volatile memory [bytes]

The data cannot be written.

The contents of the data state how much volatile memory is available per channel for increasing the volatile user data storage area via MD.

It is advisable to check whether the available memory is sufficient before increasing, for example, the number of LUDs, number of functional parameters, or the size of the IPO buffer.

If necessary, proceed step by step:

- increase by 1, note (old) value
- NCK startup (= 'warm start' or NCK reset), read off new value
- memory requirement = new value - old value

On the first NCK startup or cold restart of the control (=deletion of user data), MD18210 \$MN_MM_USER_MEM_DYNAMIC is set by the NCK software so that at least the preset value results for MD18050 \$MN_INFO_FREE_MEM_DYNAMIC.

That is, the value is automatically increased if the initial value of MD18210 \$MN_MM_USER_MEM_DYNAMIC is too low.

The following also applies to multichannel systems:

- The preset value applies to each possible channel. That is, if there are ten possible channels, MD18210 \$MN_MM_USER_MEM_DYNAMIC is set by the NCK SW so that at least the 'preset value* ten' results for MD18050 \$MN_INFO_FREE_MEM_DYNAMIC.
- On activation of a channel, MD18210 \$MN_MM_USER_MEM_DYNAMIC is increased if necessary so that the memory free at the time of activation continues to be free (provided that the memory structure permits this) after the channel has become active.
- The activation of the maximum possible number of axes is ensured by increasing the data MD18210 \$MN_MM_USER_MEM_DYNAMIC if necessary so that memory free at the time of activation continues to be free (provided that the memory structure permits this) after the axis has become active.

'If necessary' in the previous sentences means that the adjustment is automatic if the channel/axis could not be activated with the current values of MD18210 \$MN_MM_USER_MEM_DYNAMIC/\$MN_INFO_FREE_MEM_DYNAMIC.

18060	INFO_FREE_MEM_STATIC			N01, N02, N05	S7	
-	Display data of the free nonvolatile memory			DWORD	PowerOn	
-						
840dsl-71	-	7340032	0	48234496	ReadOnly	S
840dsl-72	-	7340032	0	48234496	ReadOnly	S
840dsl-73	-	7340032	0	48234496	ReadOnly	S
840dsl-711	-	12582912	0	48234496	ReadOnly	S
840dsl-721	-	12582912	0	48234496	ReadOnly	S
840dsl-731	-	12582912	0	48234496	ReadOnly	S

Description:

The preassigned value specifies how many bytes, as a minimum, are free for the user when the NCK runs up with a 'cold restart'.

The contents of the data state how much nonvolatile memory is available during startup for configuration of the active and passive file system and other functions.

2.3 NC machine data

e.g. MD18082 \$MN_MM_NUM_TOOL

e.g. MD18150 \$MN_MM_GUD_VALUES_MEM

e.g. MD18352 \$MN_MM_U_FILE_MEM_SIZE

e.g. MD38000 \$MA_MM_ENC_COMP_MAX_POINTS)

On the first NCK power-up or cold restart of the control (=deletion of user data)

MD18230 \$MN_MM_USER_MEM_BUFFERED is set by the NCK software so that at least the default value results for MD18060 \$MN_INFO_FREE_MEM_STATIC.

Machine data for configuration of functions that require nonvolatile memory (tools, GUDs, compensations, ...) can be increased until this memory has all been allocated.

18070	INFO_FREE_MEM_DPR			EXP, N01, N02, N05	S7	
-	Display data of free memory in DUAL PORT RAM			DWORD	PowerOn	
-						
-	-	0	-	-	ReadOnly	M

Description: Output of the available memory in the Dual Port RAM (Bytes).
The data cannot be written.

18074	MM_TOOL_MANAGEMENT_TRACE_SZ			N02, N09	/FBWsl/, "Description of Functions, Tool Management"	
-	Max. size of the tool management diagnostic ring buffers			DWORD	PowerOn	
-						
-	2	25, 25	4	500	7/2	M

Description: The number of entries in the tool management diagnostic ring buffers.
Index 0 = IPO trace buffer size.
Index 1 = Prep trace buffer size.
There are separate IPO trace buffers in each channel, and a Prep trace buffer in channel 1 only.
The buffers are allocated only if bit 0 (0x0001) is ON at warm start, in both MD18080 \$MN_MM_TOOL_MANAGEMENT_MASK and per-channel MD20310 \$MC_TOOL_MANAGEMENT_MASK.
Trace data is written to the buffers when bit 13 (0x2000) is ON in per-channel MD20310 \$MC_TOOL_MANAGEMENT_MASK.

18075	MM_NUM_TOOLHOLDERS			N02, N09	/FBWsl/, "Description of Functions, Tool Management"	
-	Max. number of tool holders per TOA			DWORD	PowerOn	
-						
-	-	16	1	20	7/2	M

Description: Max. number of definable tool holders per TO range.
The address extension e of commands Te=t, Me=6 (*) is the number of the tool holder.
t=T number/tool name - depending on the function activated in the NCK.
(*) if: MD22550 \$MC_TOOL_CHANGE_MODE=1 and MD22560 \$MC_TOOL_CHANGE_M_CODE=6 applies
Normally the tool holder of milling machines is a spindle.
Also see MD20090 \$MC_SPIND_DEF_MASTER_SPIND.
For turning machines the tool holder normally is not a spindle axis.
Also see MD20124 \$MC_TOOL_MANAGEMENT_TOOLHOLDER.
In this case it should reasonably apply that MD18075 \$MN_MM_NUM_TOOLHOLDERS is larger or equal to MD20090 \$MC_SPIND_DEF_MASTER_SPIND/MD20124 \$MC_TOOL_MANAGEMENT_TOOLHOLDER.
If bit 0 = 1 in MD18080 \$MN_MM_TOOL_MANAGEMENT_MASK and MD20310 \$MC_TOOL_MANAGEMENT_MASK is set (=magazine management (TOOLMAN))

it will apply for reasonable values that MD18075 \$MN_MM_NUM_TOOLHOLDERS is smaller or equal to MD18076 \$MN_MM_NUM_LOCS_WITH_DISTANCE.

A maximum of MD18075 \$MN_MM_NUM_TOOLHOLDERS intermediate memory locations of the type spindle

(\$TC_MPP1[9998,x]=2) can then be defined.

Example: TOOLMAN inactive

MD20090 \$MC_SPIND_DEF_MASTER_SPIND shall be =3, MD18075 \$MN_MM_NUM_TOOLHOLDERS shall be =3.

Then T1=t, T2=t, T3=t, T=t can be programmed.

Example: TOOLMAN active, milling machine with Me=6 as tool change command

MD18075 \$MN_MM_NUM_TOOLHOLDERS shall be = 14, MD18076

\$MN_MM_NUM_LOCS_WITH_DISTANCE=20,

10 channels shall be active, all channels have TOOLMAN active and have the same tool and magazine data

(=one TO range for all channels). MD20090 \$MC_SPIND_DEF_MASTER_SPIND=1,....10 for the channels.

Then up to 14 locations of the kind 'tool holder'/'spindle' can be defined in the intermediate magazine memory.

Additional 6 grippers or others can be defined.

These 20 locations max. can be linked to magazines.

In the channels T1=t, T14=t and Tt, or M1=6,....M14=6 and M6 can be programmed.

The PLC version used can limit the maximum number of tool holders.

18076	MM_NUM_LOCS_WITH_DISTANCE			N02, N09	/FBWsl/, "Description of Functions, Tool Management"	
-	Max. number of magazine locations per TOA with remote connection			DWORD	PowerOn	
-						
-	-	32	1	128	7/2	M

Description:

This machine data is reasonable, if the magazine management function, TOOLMAN, is active

- See MD18080 \$MN_MM_TOOL_MANAGEMENT_MASK, MD20310 \$MC_TOOL_MANAGEMENT_MASK; for each bit 0 = 1.

Max. number of magazine locations (spindles, load locations,...) per TOA, that can have a remote connection to a magazine, defined by \$TC_MDPx[n,m].

Example: TOOLMAN shall be active: MD18076 \$MN_MM_NUM_LOCS_WITH_DISTANCE shall be = 5 and MD18077 \$MN_MM_NUM_DIST_REL_PER_MAGLOC = 2.

Two TO units shall be defined with three tool holders/spindles and two load locations each.

Furthermore, two grippers each shall be defined in each TO unit.

This means that a total of 14 locations shall be defined in the intermediate memory magazine/load magazine for the distances and assignments.

4 magazines shall be defined for TO unit 1, 6 magazines for TO unit 2.

With the value set to MD18076 \$MN_MM_NUM_LOCS_WITH_DISTANCE = 5 each tool holder and each load location

of the two TO units with up to two magazines (MD18077 \$MN_MM_NUM_DIST_REL_PER_MAGLOC = 2) per remote relationship

can be connected; (see \$TC_MDP1 and \$TC_MDP2) and for each tool holder max. two more grippers

(MD18077 \$MN_MM_NUM_DIST_REL_PER_MAGLOC = 2) can be assigned; (see \$TC_MLSR).

One tool holder / one spindle location can subsequently have two tables - one distance table for magazines and

one assignment table for grippers and similar locations.

2.3 NC machine data

18077	MM_NUM_DIST_REL_PER_MAGLOC			N02, N09	/FBWsl/, "Description of Functions, Tool Management"	
-	Max. no. of magazines in the distance table of a magazine loc.			DWORD	PowerOn	
-						
-	-	64	0	64	7/2	M

Description: This machine data will only be active, if the magazine management, TOOLMAN function is active.

- See MD18080 \$MN_MM_TOOL_MANAGEMENT_MASK, MD20310 \$MC_TOOL_MANAGEMENT_MASK.

Two sizes are defined with this magazine data:

- 1.) Max. number of magazines in the distance table of a magazine location (spindle, load location, ...)
- 2.) Max. number of locations (gripper, ...) in the connection table of a spindle/tool holder location.

Example: MD18077 \$MN_MM_NUM_DIST_REL_PER_MAGLOC shall be = 3.

Two TO units shall be defined with two tool holder/spindles each and one load location each.

Furthermore four grippers shall be defined in each TO unit.

4 magazines shall be defined for TO unit 1; 6 magazines shall be defined for TO unit 2.

Then, each tool holder can define max. three distances for the magazines (see \$TC_MDP2) and additionally a max. of three relationships to the grippers (\$TC_MLSR).

18078	MM_MAX_NUM_OF_HIERARCHIES			N02, N09	/FBWsl/, "Description of Functions, Tool Management"	
-	The maximum number of hierarchies for magazine location types			DWORD	PowerOn	
-						
-	-	8	0	32	7/2	M

Description: The machine data only has effect if the function 'tool magazine management', TMMG, is activated - see MD18080 \$MN_MM_TOOL_MANAGEMENT_MASK, MD20310 \$MC_TOOL_MANAGEMENT_MASK.

The maximum number of hierarchies for magazine location types.

In variable \$TC_MPTH[n,m], the allowed range of n is from 0 to MD18078 '\$MN_MM_MAX_NUM_OF_HIERARCHIES - 1'.

(The maximum of index m is given by MD18079 \$MN_MM_MAX_HIERARCHY_ENTRIES.)

Value = 0 means that the function 'magazine location type hierchies' is not available.

18079	MM_MAX_HIERARCHY_ENTRIES			N02, N09	/FBWsl/, "Description of Functions, Tool Management"	
-	The max. number of entries in a mag. location type hierarchy.			DWORD	PowerOn	
-						
-	-	8	1	32	7/2	M

Description: The machine data is only effective if the function 'tool magazine management', TMMG, is activated - see MD18080 \$MN_MM_TOOL_MANAGEMENT_MASK, MD20310 \$MC_TOOL_MANAGEMENT_MASK - and if MD18078 \$MN_MM_MAX_NUM_OF_HIERARCHIES is greater than zero.

The maximum number of entries in a magazine location type hierarchy.

The permissible range of the index m of system parameter \$TC_MPTH[n,m] is from 0 to 'MD18079 \$MN_MM_MAX_HIERARCHY_ENTRIES - 1'.

(The maximum of index n is given by MD18078 \$MN_MM_MAX_NUM_OF_HIERARCHIES.)

18080	MM_TOOL_MANAGEMENT_MASK			N02, N09	K1, W1	
-	Step-by-step memory reservation for tool management (SRAM)			UDWORD	PowerOn	
-						
-	-	0x2	0	0xFFFF	7/1	M

Description:

Activating the TM memory with "0" means:

The set TM data does not take up any memory space, TM is not available.

Bit 0=1: Memory for TM-specific data is provided, the MDs which reserve memory space have to be set accordingly (MD18086 \$MN_MM_NUM_MAGAZINE_LOCATION, MD18084 \$MN_MM_NUM_MAGAZINE)

Bit 1=1: Memory for monitoring data (WZMO) is provided

Bit 2=1: Memory for user data (CC data) is provided

Bit 3=1: Memory to consider adjacent location is provided

Bit 4=1: Memory and function enable for PI service _N_TSEARC = "Complex search for tools in magazines" is provided.

Bit 5=1: Wear monitoring active

Bit 6=1: Wear grouping available

Bit 7=1: Reserve memory for adapters for magazine locations

Bit 8=1: Memory for application and/or setup offsets

Bit 9=1: Tools associated with a turret no longer leave their turret location on tool change (display).

Bit 10=1: The multitool function is available

(other MDs can be used to modify the configuration).

Bit 10=0: The multitool function is not available

(the functional scope configured with other MDs is ineffective).

This broken down approach to memory reservation means that memory usage can be optimized in line with the functions used.

Example:

Default memory reservation for TM:

MD18080 \$MN_MM_TOOL_MANAGEMENT_MASK = 3 (bit 0 + 1=1) means that TM and tool monitoring data are provided

MD18080 \$MN_MM_TOOL_MANAGEMENT_MASK = 1 means tool management without tool monitoring function data

18082	MM_NUM_TOOL			N02, N09	FBWsl, S7	
-	Number of tools the NCK can manage (SRAM)			DWORD	PowerOn	
-						
-	-	30	0	1500	7/2	M

Description:

The NC cannot manage more tools than the number entered in the MD. A tool has at least one cutting edge.

Buffered user memory is used.

The maximum possible number of tools is equal to the number of cutting edges. The MD must also be set when TOOLMAN is not used.

The buffered data are lost when the machine data is changed.

Related to:

MD18100 \$MN_MM_NUM_CUTTING_EDGES_IN_TOA

18083	MM_NUM_MULTITOO			N02, N09	-	
-	Multitool function. Number of tools the NCK can manage.			DWORD	PowerOn	
-						
-	-	15	0	750	1/1	M

2.3 NC machine data

Description: "Multiple tools in one magazine location" function (multitool). Number of multitools the NCK can manage.

18084	MM_NUM_MAGAZINE			N02, N09	FBWsl	
-	Number of magazines the NCK can manage (SRAM)			DWORD	PowerOn	
-						
-	-	4	0	64	7/2	M

Description: Tool management (TOOLMAN and TMMG) - only when MD TOOLMAN and option TOOLMAN are set:
 Number of magazines which the NCK can manage (active and background magazines).
 This MD reserves the buffered memory for the magazines.
 Important: One loading and one buffer magazine are set up in in the tool management for each TOA unit. These magazines have to be taken into account here.
 Value = 0 -The tool management cannot be activated because no data can be created.

840dsl-721	-	-	0	600	7/2	M
840dsl-731	-	30	0	1500	7/2	M

Description: TMMG - only when MD TOOLMAN and TOOLMAN option are set:
 Number of magazine locations which the NCK can manage.
 This machine data reserves the buffered memory for the magazine locations.
 Important: The number of all buffers and loading points also has to be included in the calculation here.
 Value = 0: Tool management cannot be activated because no data can be created.
 Related to:
 MD18080 \$MN_MM_TOOL_MANAGEMENT_MASK
 MD20310 \$MC_TOOL_MANAGEMENT_MASK

18088	MM_NUM_TOOL_CARRIER			N02, N09	W1	
-	Maximum number of definable tool holders			DWORD	PowerOn	
-						
-	-	0	0	600	7/2	M

Description: Maximum number of definable toolholders for orientable tools in the TO area. The value is divided by the number of active TO units. The integer result states how many toolholders can be defined for each TO unit. The data for defining a toolholder are set with the system variables \$TC_CARR1, ... \$TC_CARR14.

The data are stored in battery-backed memory.

Application example(s):

-

18090	MM_NUM_CC_MAGAZINE_PARAM			N02, N09	FBWsl	
-	Number of OEM magazine data (SRAM)			DWORD	PowerOn	
-						
-	-	0	0	64	2/2	M

Description: Number of magazine data (of type Integer) which are available to the user or the compile cycle.

This machine data increases the buffered memory requirement by sizeof(int)*max. number of magazines.

Related to:

MD18080 \$MN_MM_TOOL_MANAGEMENT_MASK

MD18084 \$MN_MM_NUM_MAGAZINE

18091	MM_TYPE_CC_MAGAZINE_PARAM			N02, N09	-	
-	Type of OEM magazine data (SRAM)			DWORD	PowerOn	
-						
-	64	3, 3, 3, 3, 3, 3, 3...	1	6	2/2	M

Description: Individual types can be assigned to the parameters in this way. Array index n can take values from 0 to that of MD18090 \$MN_MM_NUM_CC_MAGAZINE_PARAM.

Type of magazine-specific user data configured by MD18090 \$MN_MM_NUM_CC_MAGAZINE_PARAM.

Each parameter can be assigned its own type. Permissible types are:

Type	Value of machine data
------	-----------------------

(See types of the NC language)

BOOL	1
CHAR	2
INT	3
REAL	4
STRING	5 (is not allowed, is not supported by the MCP.)
AXIS	6
FRAME	Not defined

Example:

MD18090 \$MN_MM_NUM_CC_MAGAZINE_PARAM=1

MD18091 \$MN_MM_TYPE_CC_MAGAZINE_PARAM=2

Parameter \$TC_MAPC1 = "A" can then be programmed.

Buffered user memory is used. A value change leads to a reconfiguration of the buffered memory.

AXIS 6
FRAME Not defined

Example:

MD18098 \$MN_MM_NUM_CC_MON_PARAM=1

MD18099 \$MN_MM_TYPE_CC_MON_PARAM=2

Parameter \$TC_MOPC1 = "A" can then be programmed.

Buffered user memory is used. A value change leads to a reconfiguration of the buffered memory.

Related to:

MD18100 \$MN_MM_NUM_CUTTING_EDGES_IN_TOA

MD18098 \$MN_MM_NUM_CC_MON_PARAM

18100	MM_NUM_CUTTING_EDGES_IN_TOA			N02, N09	W1	
-	Number of tool offsets that the NCK can manage (SRAM)			DWORD	PowerOn	
-						
-	-	30	0	3000	7/2	M

Description: .Defines the number of tool cutting edges. This machine data reserves approximately 250 bytes of battery-buffered memory per TOA block for each tool cutting edge, irrespective of the tool type

Tools with cutting edges of type 400-499 (= grinding tools) also occupy the location of a cutting edge.

Example:

Defining 10 grinding tools each of which has one cutting edge. Then at least:

MD18082 \$MN_MM_NUM_TOOL = 10

MD18100 \$MN_MM_NUM_CUTTING_EDGES_IN_TOA = 20

Also see MD18082 \$MN_MM_NUM_TOOL

Buffered user memory is used

Special cases:

The buffered data is lost if this machine data is altered!

18102	MM_TYPE_OF_CUTTING_EDGE			N02, N09	W1	
-	Type of D No. programming (SRAM)			DWORD	PowerOn	
NDLD						
-	-	0	0	1	ReadOnly	S

Description: This MD activates the 'flat D number management'. This function is no longer supported.
The default value is zero. This means that the NCK manages the T and D numbers.
The NCK only accepts a value > 0 if bit 0 and bit 1 are not set in MD18080 \$MN_MM_TOOL_MANAGEMENT_MASK. This means that neither the magazine management function nor the tool monitoring can be active.

Value: Meaning

0: No 'flat D number management' active

1: 'Flat D number' function is active

18103	MM_NUM_TOOL_ADAPTER_TYPE2			N02, N09	W1	
-	Type 2 tool adapters in all TO areas (SRAM)			DWORD	PowerOn	
-						
-	-	0	0	3000	7/2	M

Description: Number of type 2 tool adapters (angle head adapters) in all TO areas.

2.3 NC machine data

The function can only be used if magazine locations are free in the NCK.

For the setting to become effective, bit 7 (=0x80) must also be set in MD18080 \$MN_MM_TOOL_MANAGEMENT_MASK.

Adapter data sets and cutting-edge-specific base lengths are mutually exclusive.

This means that if type 2 adapters can be created, then the values of the following parameters can be internally assigned by the NCK:

Base length: \$TC_DP21, \$TC_DP22, \$TC_DP23.

Meaning of the values:

0:

No adapter data definitions are possible.

The cutting-edge-specific parameters \$TC_DP21-23 can be written.

>0:

Number of adapter data sets.

An additional step after definition of the data assigns the adapters to the multitool locations.

So one adapter can, for example, be assigned to multiple multitool locations.

See the machine data

MD18080 \$MN_MM_TOOL_MANAGEMENT_MASK,

MD18085 \$MC_MM_NUM_MULTITOOLOCATIONS

18104	MM_NUM_TOOL_ADAPTER			N02, N09	W1	
-	Tool adapters in all TO areas (SRAM)			DWORD	PowerOn	
-						
-	-	-1	-1	1500	7/2	M

Description:

Number of tool adapters in all TO areas.

The function can only be used if there are magazine locations in the NCK.

The tool management function must be active.

Bit 7 (=0x80) also has to be set in MD18080 \$MN_MM_TOOL_MANAGEMENT_MASK for the setting to become active.

Adapter data blocks and the cutting edge-specific basic/adaptor dimensions are mutually exclusive. This means that if adapter data are defined, the parameters \$TC_DP21, \$TC_DP22, \$TC_DP23 and their values are available in the NCK.

-1:

An adapter is automatically assigned to each magazine location.

This means that internally the same number of adapters are provided as magazine locations are provided by MD18086 \$MN_MM_NUM_MAGAZINE_LOCATION.

0:

No adapter data definitions possible. The cutting edge-specific parameters \$TC_DP21, \$TC_DP22, \$TC_DP23 are available provided that adapters are used outside the active TMMG.

> 0:

Number of adapter data blocks. This means adapters can be defined irrespective of magazine locations. An additional step after defining the data assigns the adapters to the magazine locations. This enables one adapter, for example, to be assigned to several magazine locations.

Note: The setting >0 is currently not supported by HMI Operate.

See the machine data:

MD18080 \$MN_MM_TOOL_MANAGEMENT_MASK,

MD20310 \$MC_TOOL_MANAGEMENT_MASK,

MD18084 \$MN_MM_NUM_MAGAZINE,

MD18086 \$MN_MM_NUM_MAGAZINE_LOCATION

18105	MM_MAX_CUTTING_EDGE_NO	N02, N09	W1
-	Maximum value of D number	DWORD	PowerOn
-			
-	-	9	1
-	-	32000	7/2
-	-		M

Description:

Maximum value of the D number.

This does not affect the maximum number of D numbers per cutting edge.

The monitoring of the D number assignment associated with this value is only active when the D numbers are redefined. This means that existing data sets are not subsequently checked if the MD is changed.

The following settings are advantageous:

MD18105 \$MN_MM_MAX_CUTTING_EDGE_NO is equal to

MD18106 \$MN_MM_MAX_CUTTING_EDGE_PER_TOOL.

If MD18105 \$MN_MM_MAX_CUTTING_EDGE_NO is selected > MD18106

\$MN_MM_MAX_CUTTING_EDGE_PER_TOOL, then the difference between offset number D and cutting-edge number CE should be known.

See also language commands CHKDNO, CHKDM, GETDNO, SETDNO, DZERO.

The machine data is not evaluated with the function "flat D number", and therefore has no significance there.

The MD can affect the memory requirement:

If the relation between the two, above-mentioned MDs changes from "less than or equal to" to "greater than" or vice versa, then this affects the non-buffered memory requirement.

Related to:

MD18106 \$MN_MM_MAX_CUTTING_EDGE_PER_TOOL

18106	MM_MAX_CUTTING_EDGE_PERTOOL	N02, N09	W1
-	Maximum number of D numbers per tool	DWORD	PowerOn
-			
-	-	9	1
-	-	12	7/2
-	-		M

Description:

Maximum number of cutting edges (D offsets) per tool (per T number).

This enables more safety to be achieved in the data definition. The value can be set to 1 if only tools with one cutting edge are used. This prevents more than one cutting edge being assigned to a tool in the data definition.

The following settings are advantageous: MD18105 \$MN_MM_MAX_CUTTING_EDGE_NO is equal to MD18106 \$MN_MM_MAX_CUTTING_EDGE_PER_TOOL. If MD18105 \$MN_MM_MAX_CUTTING_EDGE_NO is selected > MD18106 \$MN_MM_MAX_CUTTING_EDGE_PER_TOOL, then the difference between offset number D and cutting-edge number CE should be known.

See also language commands CHKDNO, CHKDM, GETDNO, SETDNO, DZERO.

The machine data is not evaluated with the function "flat D number", and therefore has no significance there.

The data can affect the memory requirement.

The MD can affect the memory requirement.

If the relation between the two, above-mentioned MDs changes from "less than or equal to" to "greater than" or vice versa, then this affects the non-buffered memory requirement.

Related to:

MD18105 \$MN_MM_MAX_CUTTING_EDGE_NO

2.3 NC machine data

18108	MM_NUM_SUMCORR	N02, N09	W1
-	Resulting offsets in TO area (SRAM)	DWORD	PowerOn
-			
-	-	-1	-1
		9000	7/2
			M

Description:

Total number of resulting offsets in the NCK.

The value = -1 means that the number of resulting offsets is equal to the number of cutting edges multiplied by the number of resulting offsets per cutting edge.

A value > 0 and < "number of cutting edges multiplied by the number of resulting offsets per cutting edge" means that a maximum "number of resulting offsets per cutting edge" can be defined per cutting edge but do not have to be. This means that buffered memory can be used economically. Only those cutting edges for which explicit data have been defined have a resulting offset data block.

Buffered memory is reserved. The memory requirement for a resulting offset doubles if "setup offset active" has also been configured, see MD18112 \$MN_MM_KIND_OF_SUMCORR.

See also:

MD18100 \$MN_MM_NUM_CUTTING_EDGES_IN_TOA,

MD18110 \$MN_MM_MAX_SUMCORR_PER_CUTTEDGE

18110	MM_MAX_SUMCORR_PER_CUTTEDGE	N02, N09	S7
-	Max. number of additive offsets per edge (SRAM)	DWORD	PowerOn
-			
-	-	1	1
		6	7/2
			M

Description:

Maximum number of resulting offsets per cutting edge.

If MD18108 \$MN_MM_NUM_SUMCORR > 0 then:

The data is not memory defining, but is only used for monitoring.

If MD18108 \$MN_MM_NUM_SUMCORR = -1 then:

The data is memory defining.

See also

MD18108 \$MN_MM_NUM_SUMCORR,

MD18100 \$MN_MM_NUM_CUTTING_EDGES_IN_TOA.

18112	MM_KIND_OF_SUMCORR	N02, N09	W1
-	Properties of resulting offsets in TO area (SRAM)	UDWORD	PowerOn
-			
-	-	0	0
		0x1F	7/2
			M

Description:

Properties of the resulting offsets in NCK.

Bit 0=0 "Resulting offsets fine" are backed up when the tool data are backed up.

Bit 0=1 "Resulting offsets fine" are backed up when the tool data are backed up.

Bit 1=0 Set-up offsets are backed up when the tool data are backed up.

Bit 1=1 Set-up offsets are not backed up when the tool data are backed up.

Bit 2=0 If work is done with the function tool management (TOOLMAN) and/or tool monitoring (TMMO), existing "resulting offsets fine/setup offsets" are not affected when the tool status is set to "active".

Bit 2=1 Existing resulting offsets are set to zero when the tool status is set to "active".

Bit 3=0 If work is done with the function "TOOLMAN" + "adapter", the "resulting offsets fine"/setup offsets are transformed.

Bit 3=1 No transformation of the "resulting offsets fine"/setup offsets

Bit 4=0 No set-up offset data sets

Bit 4=1 Set-up offset data sets are additionally created. Whereby the resulting offset is composed of the sum of the set-up offset + "resulting offset fine"

Changing the status of bits 0, 1, 2, 3 does not change the memory structure.

Changing the status of bit 4 triggers restructuring of the buffered memory after the next PowerOn.

MD18104 \$MN_MM_NUM_TOOL_ADAPTER

18113	MM_NUM_DRS_GRINDING_PATHS	N02, N09	-
-	Number of different path names for grinding tool dressing programs.	DWORD	PowerOn
-			
-	-	10	0
		1500	2/2
			M

Description: The number of different path names in the NCK that can be defined for the storage of the dressing programs of the grinding tools. See system parameter \$TC_TPG_DRSPATH. Grinding tools can only be defined if MD17540 \$MN_TOOLTYPES_ALLOWED has the bit value 'H90' set.

Buffered memory is reserved if MD17540 \$MN_TOOLTYPES_ALLOWED has enabled the function.

18114	MM_ENABLE_TOOL_ORIENT	N02, N09	W1, F2
-	Assign an orientation to tool cutting edges	DWORD	PowerOn
-			
-	-	0	0
		3	7/2
			I

Description: The function allows an orientation deviating from the default value to be assigned to each tool cutting edge.

Value = 0:
The tool orientation function is inactive.

Value = 1:
The system parameter \$TC_DPV[t, d] is assigned to each tool cutting edge D=d of the tool T=t, with the aid of which one of 6 possible tool orientations in positive or negative coordinate direction can be defined.

Value = 2:
Not only the system parameter \$TC_DPV[t, d] but also the additional three system parameters \$TC_DPV3[t, d], \$TC_DPV4[t, d] and \$TC_DPV5[t, d] are assigned to each tool cutting edge D=d of the tool T=t, with the aid of which any spatial tool orientation can be defined

Value = 3:
Not only the system parameters \$TC_DPV[t, d] and \$TC_DPV3 - \$TC_DPV5 but also the additional three system parameters \$TC_DPVN3[t, d], \$TC_DPVN4[t, d] and \$TC_DPVN5[t, d] are assigned to each tool cutting edge D=d of the tool T=t, with the aid of which a vector (normal vector) can be defined that is preferably perpendicular to the tool orientation. The normal vector may be modified so that it lies in the plane formed by the orientation and the programmed normal vector but perpendicular to the orientation. The orientation and the possibly modified normal vector together define a complete orientation coordinate system.

T, D are the NC addresses T and D with which the tool change or the tool selection and the offset selection are programmed.

2.3 NC machine data

The machine data affects the requirement for buffered memory.

18116	MM_NUM_TOOL_ENV			N02, N09	W1	
-	Number of tool environments in the TO area (SRAM)			DWORD	PowerOn	
-						
-	-	0	0	600	7/2	M

Description: Total number of tool environments in the NCK.
Battery-backed memory is reserved.

18118	MM_NUM_GUD_MODULES			N02	S7	
-	Number of GUD files in active file system (SRAM)			DWORD	PowerOn	
-						
-	-	7	1	9	7/2	M

Description: A GUD block corresponds to a file in which user-defined data can be stored. 9 GUD blocks are available of which 3 are already assigned to specific users/applications.
UGUD_DEF_USER (block for user)
SGUD_DEF_USER (block for SIEMENS)
MGUD_DEF_USER (block for machine manufacturer)
Special cases:
The number of GUD modules is determined by the GUD module with the highest number entered.
Example:
If the following GUD modules are defined,
UGUD
MGUD
GUD5
GUD8
then the machine data must be set to a value of 8, signifying a memory requirement of 8 x 120 bytes = 960 bytes.
It is therefore advisable to select the "lowest" possible GUD module. If GUD modules UGUD and MGUD have not been assigned elsewhere, then they may be used for this purpose.
Related to:
MD18150 \$MN_MM_GUD_VALUES_MEM
(Memory space for user variables)

18120	MM_NUM_GUD_NAMES_NCK			N02	S7	
-	Number of global user variable names (SRAM)			DWORD	PowerOn	
-						
-	-	60	60	32000	7/2	M

Description: Defines the number of user variables for NCK global user data (GUD). Approximately 80 bytes of memory per variable are reserved in the SRAM for the names of the variables. The additional memory required for the value of the variable depends on the data type of the variable. The number of available NCK global user data is exhausted on reaching the limit value set in MD18120 \$MN_MM_NUM_GUD_NAMES_NCK or MD18150 \$MN_MM_GUD_VALUES_MEM (memory space for user variables).
Buffered user memory is used.
Special cases:
The battery-backed data are lost if this machine data is altered.
Related to:
MD18150 \$MN_MM_GUD_VALUES_MEM
(Memory space for user variables)

18130	MM_NUM_GUD_NAMES_CHAN			N02	S7	
-	Number of channel-specific user variable names (SRAM)			DWORD	PowerOn	
-						
-	-	450	450	32000	7/2	M

Description: Defines the number of user variable names for channel-specific global user data (GUD). Approximately 80 bytes of memory are reserved in the SRAM for each variable name. The additional memory required for the value of the variable is equal to the size of the data type of the variable multiplied by the number of channels. This means that each channel has its own memory available for the variable values. The number of available channel-specific global user data is exhausted on reaching the limit value set in MD18130 \$MN_MM_NUM_GUD_NAMES_CHAN or MD18150 \$MN_MM_GUD_VALUES_MEM (memory space for user variables).

The name created with the DEF statement is valid for all channels.

The memory requirement for the variable value is equal to the size of the data type multiplied by the number of channels.

Buffered user memory is used.

Special cases:

The battery-backed data are lost if this machine data is altered.

Related to:

MD18150 \$MN_MM_GUD_VALUES_MEM
(Memory space for user variables)

18150	MM_GUD_VALUES_MEM			N02	A2	
-	Memory location for global user variable values (SRAM)			DWORD	PowerOn	
-						
-	-	430	430	32000	7/2	M

Description: The specified value reserves memory space for the variable values of the global user data (GUD). The dimensioning of the memory depends to a large extent on the data types used for the variables.

Overview of the memory requirements of the data types:

Data type	Memory requirement
REAL	8 bytes
INT	4 bytes
BOOL	1 byte
CHAR	1 byte
STRING	1 byte per character, 100 characters permitted per string
AXIS	4 bytes
FRAME	up to 1KB depending on control model

The total memory required by a channel or axis-specific global user variable is the memory requirement of the variables multiplied by the number of channels or axes. The number of global user variables available is given when the limit defined in MD18120 \$MN_MM_NUM_GUD_NAMES_NCK, MD18130 \$MN_MM_NUM_GUD_NAMES_CHAN, MD18140 \$MN_MM_NUM_GUD_NAMES_AXIS or MD18150 \$MN_MM_GUD_VALUES_MEM is reached.

Buffered user memory is used.

Special cases:

The buffered data are lost if this machine data is altered!

MD18118 \$MN_MM_NUM_GUD_MODULES
(Number of GUD blocks)

MD18120 \$MN_MM_NUM_GUD_NAMES_NCK
(Number of global user variables)

2.3 NC machine data

MD18130 \$MN_MM_NUM_GUD_NAMES_CHAN
(Number of channel-specific user variables)

18156	MM_NUM_R_PARAM_NCK			N01	K1	
-	Number of global R variables (SRAM)			DWORD	PowerOn	
-						
-	-	0	0	32535	7/2	M

Description: Defines the number of available global R-parameters in the NCK.

18160	MM_NUM_USER_MACROS			N02	S7	
-	Number of macros (DRAM)			DWORD	PowerOn	
-						
-	-	82	82	32000	7/2	M

Description: Defines the number of macros that can be stored in the files `_N_SMAC_DEF`, `_N_MMAC_DEF` und `_N_UMAC_DEF`. Each of these files which is opened occupies at least one kbyte memory space for the file code in the part program memory. Another kbyte of memory is reserved for the file when the one kbyte file code limit is exceeded.

The dynamic user memory is used. For the stated number of macros, approximately 375 bytes are reserved per macro for management tasks.

18170	MM_NUM_MAX_FUNC_NAMES			N02	V2, A2	
-	Number of miscellaneous functions (cycles, DRAM)			DWORD	PowerOn	
-						
-	-	450	450	32000	7/2	M

Description: The data limits the maximum number of special functions over and above the predefined functions (such as sine, cosine, etc.) which can be used in

- cycle programs
- compile cycle software.

The function names are entered in the global NCK dictionary and must not conflict with the names that already exist.

The SIEMENS cycle package contains special functions that are taken into account by the default setting of the MD.

The data are stored in unbuffered memory. Approximately 150 bytes are required for each special function for management purposes.

Related to:

MD18180 \$MN_MM_NUM_MAX_FUNC_PARAM
(Number. of additional parameters)

18180	MM_NUM_MAX_FUNC_PARAM			N02	V2	
-	Number of additional parameters for cycles according to MD 18170			DWORD	PowerOn	
-						
-	-	6750	6750	32000	7/2	M

Description: Defines the maximum number of parameters required for the special functions in

- cycle programs
- compile cycle software.

50 parameters are required for the special functions of the SIEMENS cycle package, software version 1.

The data are stored in unbuffered memory. 72 bytes of memory are reserved for each parameter.

18210	MM_USER_MEM_DYNAMIC			EXP, N02	S7	
-	Volatile user memory [kB]			DWORD	PowerOn	
NDLD						
-	-	-	0	135072	ReadOnly	M

Description:

The volatile memory available in the NCK.

MD18210 \$MN_MM_USER_MEM_DYNAMIC makes the size of the volatile memory available to the user visible.

There are various types of user data in this memory area, for example.

- Local user data
- IPO block buffers
- User macros
- Diagnostics functions such as trace recording of times,.....
- Tool management trace
- Communication with 1-n HMIs; value of n: see MD10134 \$MN_MM_NUM_MMC_UNITS.
- Reorg log file (required for internal purposes of the NC program sequence)
- ...

Each additionally active channel occupies a substantial amount of memory. With channel activation, the value of the MD is automatically increased accordingly and the value of MD18050 \$MN_INFO_FREE_MEM_DYNAMIC is retained if possible.

Each activated axis requires part of this memory. With axis activation, the value of the MD is automatically increased accordingly and the value of MD18050 \$MN_INFO_FREE_MEM_DYNAMIC is retained if possible.

The possible values of MD18050 depend on the hardware and software configurations.

Information alarms 6030, 6035 may indicate that the desired total memory may not be available on the model or on the hardware. See also MD11415 \$MN_SUPPRESS_ALARM_MASK_2, bit 22

The value of NCK is automatically set after startup of the NCK without memory retention (cold restart). The value is then such that the free memory defined in MD18050 \$MN_INFO_FREE_MEM_DYNAMIC is available to the user.

(See the description of MD18050 \$MN_INFO_FREE_MEM_DYNAMIC).

The data in the volatile memory are lost when the NCK is switched off.

Related to:

The available volatile memory can be taken from MD18050 \$MN_INFO_FREE_MEM_DYNAMIC (display data of the free dynamic memory).

18230	MM_USER_MEM_BUFFERED			N02	S7	
-	Buffered user memory			DWORD	PowerOn	
NDLD						
-	-	-	0	36864	ReadOnly	M

Description:

Nonvolatile user memory (in kB).

Various types of user data are stored in this memory area.

For example:

- NC part programs
- R variables
- Global user data (GUD)
- Definitions of the protection zones
- Correction tables EEC, CEC, QEC
- Tool / magazine data

...

This data is retained after control power-off.

(Provided the data backup (battery,...) is in good working order, i.e. the Init switch is correctly set on the control).

This means that they are available unchanged after restart.

Each additional active channel occupies some nonvolatile memory. With channel activation, the value of the MD is automatically increased accordingly; the value of MD18060 \$MN_INFO_FREE_MEM_STATIC is retained if possible.

To enlarge this user memory further, MD19250 \$ON_USER_MEM_BUFFERED must be increased.

The available values depend on the hardware and software configurations.

Information alarms 6030, 6035 can indicate that the desired total memory may not be available on the model or on the hardware. See also MD11415

\$MN_SUPPRESS_ALARM_MASK_2, bit 22

See also the meaning of MD18060 \$MN_INFO_FREE_MEM_STATIC

18232	MM_ACTFILESYS_LOG_FILE_MEM			N02	-	
-	System: logfile size in SRAM [KB]			DWORD	PowerOn	
-						
-	3	400, 50, 30	0	32000	2/2	M

Description:

Buffered log file for buffered data of the active file system (in kbytes)

Systems with slow data buffering media store changed buffered data in the internal system SRAM. When the buffer is full, all data of the active file system are made persistent. The buffer backs up the data persistence of the last persistence operation until the next power fail. After a power fail (power failure or power OFF), data that had not yet been made persistent at the time of the power fail can be restored from this buffer.

The log file serves to minimize or totally avoid data loss in the event of power fail. 1000 entries require approximately 70 kB.

A value greater than 0 is only practicable if MD18231 \$MN_MM_USER_MEM_BUFFERED_TYPEOF[1] = 1.

A value equal to 0 means that the buffered data are not voltage loss safe if MD18231 \$MN_MM_USER_MEM_BUFFERED_TYPEOF[1] = 1 (typical for SINUMERIK solution line)

Example:

With MD18232 \$MN_MM_ACTFILESYS_LOG_FILE_MEM[2] = 0, data changes from synchronized actions can be excluded from the power fail data backup.

An improved time response of the synchronized actions would be advantageous. This should only be set if the buffered data that are changed by the synchronized action are not safety-related.

Index Meaning

- 0 Preprocessing buffer
- 1 Buffer for data changes within the range of the tool change and retract
- 2 Buffer for data changes of the main processing (synchronized actions)

See also MD17610 \$MN_DEPTH_OF_LOGFILE_OPT_PF, which can be used to optimize the behavior.

2.3 NC machine data

18233	IS_CONTINUOUS_DATA_SAVE_ON			EXP, N02	-	
-	System: Automatic saving of persistent data			BOOLEAN	PowerOn	
-						
-	3	TRUE, TRUE, TRUE	FALSE	TRUE	7/2	M

Description: The machine data is relevant only if MD18231 \$MN_MM_USER_MEM_BUFFERED_TYPEOF = 1.
Value = 0 : Continuous saving of persistent data on disk/flash/etc. is deactivated.
The dynamic response of the software on systems of the SolutionLine range can thus be improved.
Value = 1 : Continuous automatic saving of persistent data on disk/flash/etc. is active.
Index 0 = Reserved
Index 1 = Definition for the buffered data of the active file system (incl. machine data).
Index 2 = Definition for the buffered data of the passive file system (part programs, cycles,).
The default value should be changed only for diagnostic purposes or for optimizing the dynamic response.
The default value should be changed only if the system is operated in an environment, where no spontaneous shutdown of the system / spontaneous power failure occurs.
Otherwise, persistent data can be lost.

18234	MM_MEMORY_CONFIG_MASK			EXP, N02	-	
-	Setting of backup of persistant data of the current file system			UDWORD	PowerOn	
-						
-	-	0x01	0x00	0x01	2/2	M

Description: Bit 0 is defined for MD18231 \$MN_USER_MEM_BUFFERED_TYPEOF[1]=1. If the buffer size defined by MD18232 \$MN_MM_ACTFILESYS_LOG_FILE_MEM contains many data in the respective buffer, they are made persistent by the NCK software as follows:
Value = 0: synchronous data backup
Value = 1: asynchronous data backup
Asynchronous means not synchronized with the NCK sequence. Synchronous means that the preprocessing task in NCK is stopped for the time required for making the data persistent. Which setting is preferable depends on the hardware used and/or on the actual NCK application.

18235	MM_INCOA_MEM_SIZE			EXP	-	
-	Size of the DRAM memory for INCOA applications [Kbyte]			DWORD	PowerOn	
-						
-	-	20480	0	25600	7/2	M

Description: On cold restart of the control system, the default value of MD18235 \$MN_MM_INCOA_MEM_SIZE specifies the DRAM memory range that is available for INCOA applications in total.
This MD can only be read. With the diagnostics function "Read current actual value" the memory space actually occupied by the INCOA applications can be determined.

18237	MM_CYC_DATA_MEM_SIZE			EXP, N02	-	
-	Cycle/display setting data in SRAM [kB]			DWORD	PowerOn	
-						
-	-	0	0	128	ReadOnly	M

Description: Size of the buffered memory for 'Setting data for cycles and display' [kB]

18238	MM_CC_MD_MEM_SIZE			N02	TE01	
-	Compile cycle machine data in SRAM [kB]			DWORD	PowerOn	
-						
-	-	256	0	32000	7/1	M

Description: Buffered user memory for compile cycle machines (in KB)

18270	MM_NUM_SUBDIR_PER_DIR			N02	S7	
-	Number of subdirectories (DRAM)			DWORD	PowerOn	
-						
-	-	256	0	-	ReadOnly	M

Description: Defines the maximum number of subdirectories that can be created in a directory or subdirectory of the passive file system.
This value is for information only, and cannot be changed.
See also MD18280 \$MN_MM_NUM_FILES_PER_DIR (number of files per directory).

18280	MM_NUM_FILES_PER_DIR			N02	S7	
-	Number of files per directory (DRAM)			DWORD	PowerOn	
-						
-	-	512	512	3000	7/2	M

Description: Defines the maximum number of files that can be created in a directory or subdirectory of the passive file system.
See also MMD18270 \$MN_MM_NUM_SUBDIR_PER_DIR (number of subdirectories per directory).

18310	MM_NUM_DIR_IN_FILESYSTEM			N02	S7	
-	Number of directories in passive file system (SRAM)			DWORD	PowerOn	
-						
-	-	30	30	256	7/2	M

Description: The machine data limits the number of directories in the passive file system.
It can be used to reserve memory in the buffered user memory for the management of the directories. The directories and subdirectories of the passive file system set up by the system are included in this machine data. The memory required for the management of the directories can be calculated as follows:
Corresponds with:
MD18270 \$MN_MM_NUM_SUBDIR_PER_DIR

18320	MM_NUM_FILES_IN_FILESYSTEM			N02	S7	
-	Number of files in passive file system (persistent)			DWORD	PowerOn	
-						
-	-	750	64	3000	7/2	M

Description: Defines the number of files available in the part program memory.
Nonvolatile user memory is used.
Special cases:
The backed-up data are lost if this machine data is altered.
Related to:
MD18280 \$MN_MM_NUM_FILES_PER_DIR
(Number of files in directories)

2.3 NC machine data

18321	MM_NUM_SYSTEM_FILES_IN_FS			N02	-	
-	Number of system files			DWORD	PowerOn	
-						
-	1	500	500	1000	1/1	M

Description: Index 0: Number of temporary system files in the passive file system (see also MD18355 \$MN_MM_T_FILE_MEM_SIZE);
e.g.: system traces

18342	MM_CEC_MAX_POINTS			N01, N02	K3	
-	Max. number of interpolation points on sag compensation (SRAM)			DWORD	PowerOn	
-						
-	62	128, 128, 128, 128, 128, 128, 128, 128...	0	2000	7/2	M

Description: The MD defines the memory space available for the compensation tables.
When MD18342 \$MN_MM_CEC_MAX_POINTS = 0, no memory is set up for the table. The sag compensation function cannot then be used.
Caution!
If MD18342 \$MN_MM_CEC_MAX_POINTS[t] is changed, when the system is powered up, the buffered NC user memory is automatically reset. This deletes all user data in the buffered user memory (e.g. drive and HMI machine data, tool offsets, part programs etc.).
Related to:
SD41300 \$SN_CEC_TABLE_ENABLE[t]
Evaluation of the sag compensation table (t) enabled.

840dsl-731	3	7680, 0, 0	0	22528	2/2	M

Description: The machine data is not available or not defined for PowerLine control models.
End user memory for files in the passive file system (in kbyte).
There are various types of user data in this memory area.
E.g.: NC part programs, cycle programs of the end user, diagnostic files,
The settable values depend on the hardware and software configurations.
The settable size of the part program memory is, apart from the upper limit value, determined by the MD18230 \$MN_MM_USER_MEM_BUFFERED and can also be determined by a software option.
Index 0 = Size of the battery-backed part program / cycle program memory
Index 1 = Reserved
Index 2 = Reserved

18353	MM_M_FILE_MEM_SIZE			EXP, N02	S7	
-	Memory capacity for machine manufacturer's cycles/files			DWORD	PowerOn	
-						
840dsl-71	3	512, 0, 0	0	15360	1/1	M
840dsl-72	3	512, 0, 0	0	15360	1/1	M
840dsl-73	3	512, 0, 0	0	15360	1/1	M
840dsl-711	3	2560, 0, 0	0	22528	1/1	M
840dsl-721	3	2560, 0, 0	0	22528	1/1	M
840dsl-731	3	2560, 0, 0	0	22528	1/1	M

Description:

The machine data is not available or not defined for PowerLine control models.

Memory for machine manufacturer files in the passive file system (in kbyte).

The machine manufacturer's files are in this memory area of the passive file system.

E.g.: cycle programs

The settable values depend on the hardware and software configurations.

The settable size of the memory is, apart from the upper limit value, determined by the MD18230 \$MN_MM_USER_MEM_BUFFERED.

Index 0 = Minimum size of the battery-backed (persistent) part program / cycle program memory

Index 1 = Reserved

Index 2 = Reserved

18354	MM_S_FILE_MEM_SIZE			EXP, N02	-	
-	Size of the Siemens cycle program memory [0] Size of the volatile cycle program memory [1] Reserved [2] Size of the volatile memory for system files (NRK fault file, etc.)			DWORD	PowerOn	
-						
-	3	3072, 0, 30	0	3072	7/2	M

Description:

Memory for the control manufacturer's files in the passive file system (in KB)

The control manufacturer's files are in this memory area of the passive file system, e.g: cycle programs, system files

The settable values depend on the hardware and software configurations.

The settable size of the memory, apart from the upper limit value

for index = 0 is limited by the size of the available nonvolatile memory (see siehe MD18230\$MN_MM_USER_MEM_BUFFERED),

for Index = 2, is limited by the wize of the internally available buffered (SRAM) memory.

Index 0 = Size of the nonvolatile cycle program memory

Index 2 = Size of the non-volatile memory for system files in the SRAM. E.g. storage location of the NRK fault file.

18355	MM_T_FILE_MEM_SIZE			EXP, N02	-	
-	Memory size for temporary files			DWORD	PowerOn	
-						
-	-	4608	4608	1048576	7/2	M

Description:

Memory for temporary files in the passive file system (in KB), e.g. compilations of cycles (preprocessing), cycles on CF, system traces

2.3 NC machine data

18357	MM_EES_FILE_MEM_SIZE			EXP, N02	-	
-	Size of the buffer memory for EES			DWORD	PowerOn	
-						
-	-	0	-	-	ReadOnly	S

Description: Size of the buffer memory for the "Execution from External Storage" function in the passive file system (in kB)

18360	MM_EXT_PROG_BUFFER_SIZE			N01	B1, K1	
-	FIFO buffer size for processing from external source (DRAM)			DWORD	PowerOn	
-						
-	-	50	30	1000000	7/2	M

Description: A FIFO buffer is needed on the NCK for each program level (main program or subprogram) that is processed externally (reload mode).
The size of the FIFO buffer is defined in kbyte by MD18360 \$MN_MM_EXT_PROG_BUFFER_SIZE.
MD18360 \$MN_MM_EXT_PROG_NUM sets the number of FIFO buffers which are simultaneously available.
During startup, the memory size determined by multiplying MD18360 \$MN_MM_EXT_PROG_BUFFER_SIZE by MD18362 \$MN_MM_EXT_PROG_NUM is reserved in the DRAM.
If the stated value exceeds the available memory space, alarm 4077 is output when writing the machine data.
References:
/PGA/Programming Guide Advanced, Section 2

18362	MM_EXT_PROG_NUM			N01	K1	
-	Number of program levels which can be simultaneously processed			BYTE	PowerOn	
-						
-	-	1	0	13	7/2	M

Description: Number of program levels that can simultaneously be in "Processing from external source" mode NCK-wide.
System resources are reserved for the HMI <-> NCK communication during "Processing from external source". Machine data MD18362 \$MN_MM_EXT_PROG_NUM defines the number of possible program levels.
The memory space is reserved during power on by MD18360 \$MN_MM_EXT_PROG_BUFFER_SIZE * MD18362 \$MN_MM_EXT_PROG_NUM. If it is found during program execution that all system resources are occupied, this is reported by alarm 14600.

18370	MM_PROTOK_NUM_FILES			N02	D1, OEM	
-	Max.no. of log files in passive file system			DWORD	PowerOn	
-						
-	10	2, 2, 0, 0, 0, 2, 2, 2...	2, 2, 0, 0, 0, 2, 2, 2...	10, 10, 10, 10, 10, 10, 10...	1/1	M

Description: Maximum number of log files in the passive file system.
The individual values involve the users of the logging function, which are assigned the following functions:
0: Reserved for system functions: simultaneous recording, simulation, synchronized actions analysis
1: Reserved for system functions: determining program runtimes, multi-step editor
2: Reserved for OEM applications
3: Reserved for OEM applications
4: Reserved for OEM applications

5: Reserved for system functions: trace
 6: Reserved for system functions: trace
 7: Reserved for system functions: trace
 8: Reserved for system functions: trace
 9: Reserved for system functions: action log

18371	MM_PROTOD_NUM_ETPD_STD_LIST			N02	D1, OEM	
-	Number of standard data lists ETPD.			DWORD	PowerOn	
-						
-	10	25, 6, 0, 0, 0, 25, 25, 25...	25, 6, 0, 0, 0, 25, 25, 25...	25, 25, 25, 25, 25, 25, 25, 25...	1/1	M

Description: Number of standard data lists in the OPI module ETPD (user-specific).
 The individual values involve the users of the logging function, which are assigned the following functions:
 0: Reserved for system functions: simultaneous recording, simulation, synchronized action analysis
 1: Reserved for system functions: determining program runtimes, multi-step editor
 2: Reserved for OEM applications
 3: Reserved for OEM applications
 4: Reserved for OEM applications
 5: Reserved for system functions: trace
 6: Reserved for system functions: trace
 7: Reserved for system functions: trace
 8: Reserved for system functions: trace
 9: Reserved for system functions: action log

18372	MM_PROTOD_NUM_ETPD_OEM_LIST			N02	D1, OEM	
-	Number of OEM data lists ETPD.			DWORD	PowerOn	
-						
-	10	0, 0, 0, 0, 0, 0, 0, 0...	0	20	1/1	M

Description: Number of OEM data lists in the OPI module ETPD (user-specific).
 The individual values involve the users of the logging function, which are assigned the following functions:
 0: Reserved for system functions: simultaneous recording, simulation, synchronized action analysis
 1: Reserved for system functions: determining program runtimes, multi-step editor
 2: Reserved for OEM applications
 3: Reserved for OEM applications
 4: Reserved for OEM applications
 5: Reserved for system functions: trace
 6: Reserved for system functions: trace
 7: Reserved for system functions: trace
 8: Reserved for system functions: trace
 9: Reserved for system functions: action log

18373	MM_PROTOD_NUM_SERVO_DATA			N02	D1	
-	Number of servo data for log			DWORD	PowerOn	
-						
-	10	0, 0, 0, 0, 0, 10, 10, 10...	0	20	1/1	M

Description: Number of servo data, which must be recordable at the same time (user-specific).

2.3 NC machine data

The individual values involve the users of the logging function, which are assigned the following functions:

0: Reserved for system functions: simultaneous recording, simulation, synchronized action analysis

1: Reserved for system functions: determining program runtimes, multi-step editor

2: Reserved for OEM applications

3: Reserved for OEM applications

4: Reserved for OEM applications

5: Reserved for system functions: trace

6: Reserved for system functions: trace

7: Reserved for system functions: trace

8: Reserved for system functions: trace

9: Reserved for system functions: action log

18374	MM_PROTOK_FILE_BUFFER_SIZE			N02	-	
-	Size of log file buffer			DWORD	PowerOn	
-						
-	10	15000, 8000, 8000, 8000, 8000, 15000, 15000, 15000...	5000	1073741824	1/1	M

Description: Size of the data buffer between the IPO and preprocessing time levels of a log file [Bytes].

The individual values involve the users of the logging function, which are assigned the following functions:

0: Reserved for system functions: simultaneous recording, simulation, synchronized action analysis

1: Reserved for system functions: determining program runtimes, multi-step editor

2: Reserved for OEM applications

3: Reserved for OEM applications

4: Reserved for OEM applications

5: Reserved for system functions: trace

6: Reserved for system functions: trace

7: Reserved for system functions: trace

8: Reserved for system functions: trace

9: Reserved for system functions: action log

18375	MM_PROTOK_SESS_ENAB_USER			N02	-	
-	Users enabled for sessions			BYTE	PowerOn	
-						
-	10	0, 0, 0, 0, 0, 1, 1, 1...	0	1	1/1	M

Description: Users that are available for session management

The individual values involve the users of the logging function, which are assigned the following functions:

0: Reserved for system functions: simultaneous recording, simulation, synchronized action analysis

1: Reserved for system functions: determining program runtimes, multi-step editor

2: Reserved for OEM applications

3: Reserved for OEM applications

4: Reserved for OEM applications

5: Reserved for system functions: trace

6: Reserved for system functions: trace

- 7: Reserved for system functions: trace
 8: Reserved for system functions: trace
 9: Reserved for system functions, action log

18390	MM_COM_COMPRESS_METHOD	EXP, N01, N02	-
-	Supported compression methods.	UDWORD	PowerOn
-			
-	-	0x01	0
		0x7FFFFFFF	2/2
			M

Description: Setting for the compression methods to be supported.

18391	TRACE_PATHNAME	EXP	-
-	Path for trace generation	STRING	PowerOn
NBUP			
-	-	-	-
			1/1
			M

Description: Path on which traces are saved.

The trace files are used for problem analysis by NCK development.

18392	TRACE_SAVE_OLD_FILE	EXP	-
-	Old trace files are retained	BOOLEAN	PowerOn
NBUP			
-	-	FALSE	0
		-	1/1
			M

Description: The old traces are no longer overwritten when new traces are created; instead, a version extension is added to the trace file name.

At the current time this function is executed only if files are saved on the host file system (see TRACE_PATHNAME).

The trace files are used for problem analysis by NCK development.

18400	MM_NUM_CURVE_TABS	N02, N09	M3
-	Number of curve tables (SRAM)	DWORD	PowerOn
-			
-	-	0	0
		-	1/1
			M

Description: Defines the maximum number of curve tables that can be stored in the SRAM of the entire system. A curve table consists of a number of curve segments.

Related to:

MD18402 \$MN_MM_NUM_CURVE_SEGMENTS

18402	MM_NUM_CURVE_SEGMENTS	N02, N09	M3, B3
-	Number of curve segments (SRAM)	DWORD	PowerOn
-			
-	-	0	0
		-	1/1
			M

Description: Defines the maximum number of curve segments that can be stored in the SRAM of the entire system. The curve segments are a component of a curve table.

Related to

MD18400 \$MN_MM_NUM_CURVE_TABS

18403	MM_NUM_CURVE_SEG_LIN	N02, N09	M3
-	Number of linear curve segments (SRAM)	DWORD	PowerOn
-			
-	-	0	0
		-	1/1
			M

Description: Number of linear curve segments in the SRAM available throughout the NCK.

2.3 NC machine data

A curve table may consist of "normal" curve segments and linear segments. The number of "normal" curve segments in the SRAM is defined by MD18402 \$MN_MM_NUM_CURVE_SEGMENTS, these curve segments can accommodate polynomials. Linear curve segments can only accommodate straight lines. These linear curve segments are stored in battery-backed memory.

18404	MM_NUM_CURVE_POLYNOMS	N02, N09	M3, B3
-	Number of curve table polynomials (SRAM)	DWORD	PowerOn
-			
-	-	0	0
-	-	1/1	M

Description: Defines the maximum total number of polynomials for curve tables that can be stored in the SRAM of the entire system. The polynomials are a component of a curve segment. A maximum of 3 polynomials are required for a curve segment. As a rule, only 2 polynomials are used for each curve segment.

Related to

MD18400 \$MN_MM_NUM_CURVE_TABS

MD18402 \$MN_MM_NUM_CURVE_SEGMENTS

18406	MM_NUM_CURVE_TABS_DRAM	N02, N09	M3
-	Number of curve tables (DRAM)	DWORD	PowerOn
-			
-	-	0	0
-	-	1/1	M

Description: Number of curve tables in the DRAM available throughout the NCK.

The curve tables are stored either in the buffer memory or in the dynamic memory.

This MD is used to set the number of curve tables in the dynamic memory (DRAM).

18408	MM_NUM_CURVE_SEGMENTS_DRAM	N02, N09	M3
-	Number of curve segments (DRAM)	DWORD	PowerOn
-			
-	-	0	0
-	-	1/1	M

Description: Number of polynomial curve segments in the DRAM available throughout the NCK.

The curve segments are stored either in the buffer memory or in the dynamic memory.

This MD is used to set the number of segments in the dynamic memory (DRAM).

18409	MM_NUM_CURVE_SEG_LIN_DRAM	N02, N09	M3
-	Number of linear curve segments (DRAM)	DWORD	PowerOn
-			
-	-	0	0
-	-	1/1	M

Description: Number of linear curve segments in the DRAM available throughout the NCK.

A curve table may consist of "normal" curve segments and linear segments. The number of "normal" curve segments in the DRAM is defined by MD18408 \$MN_MM_NUM_CURVE_SEGMENTS_DRAM, these curve segments can accommodate polynomials. Linear curve segments can only accommodate straight lines.

The curve segments are stored either in the buffer memory or in the dynamic memory.

This MD defines the number of curve segments in the dynamic memory (DRAM).

18410	MM_NUM_CURVE_POLYNOMS_DRAM	N02, N09	M3
-	Number of curve table polynomials (DRAM)	DWORD	PowerOn
-			
-	-	0	0
-	-	1/1	M

Description: Number of polynomials for curve tables in the DRAM available throughout the NCK.

The polynomials for curve tables are stored in the buffer memory or in the dynamic memory.

This MD is used to set the number of polynomials for curve tables in the dynamic memory (DRAM).

18450	MM_NUM_CP_MODULES	N02, N09	-
-	Max. number of CP modules	DWORD	PowerOn
-			
-	-	4	0
		48	1/1
			M

Description: Number of CP coupling modules available within the NCK
The MD defines the max. permissible number of CP couplings and reserves the required dynamic memory (DRAM).

18452	MM_NUM_CP_MODUL_LEAD	N02, N09	-
-	Maximum number of CP master values	DWORD	PowerOn
-			
-	-	4	0
		99	1/1
			M

Description: Number of NCK-wide available CP master values.
This MD defines the max. permissible number of CP master values and reserves the required dynamic memory (DRAM).

18600	MM_FRAME_FINE_TRANS	N02	K2, M5
-	Fine offset with FRAME (SRAM)	DWORD	PowerOn
-			
-	-	1	0
		1	7/2
			M

Description: 0: The fine offset cannot be entered or programmed.
Disabling fine offset saves a maximum of 10KB SRAM, (depending on MD28080 \$MC_MM_NUM_USER_FRAMES).
1: The fine offset is possible for settable frames, the basic frame and the programmable frame by operator input or via program.

18601	MM_NUM_GLOBAL_USER_FRAMES	N02	K2, M5
-	Number of global predefined user frames (SRAM).	DWORD	PowerOn
-			
-	-	0	0
		100	7/2
			M

Description: Number of global predefined user frames.
The value corresponds to the number of field elements for the predefined field \$P_UIFR[].
If the value of the data is greater than 0, then all settable fields are only global. The MD28080 \$MC_MM_NUM_USER_FRAMES is then ignored.

18602	MM_NUM_GLOBAL_BASE_FRAMES	N02	K2, M5
-	Number of global base frames (SRAM).	DWORD	PowerOn
-			
-	-	0	0
		16	7/2
			M

Description: Number of NCU basic frames.
The value corresponds to the number for the predefined field \$P_NCBFR[].

2.3 NC machine data

18603	MM_NUM_GLOBAL_G_FRAMES	N02	K2, M5
-	Number of global grinding frames (SRAM)	DWORD	PowerOn
-			
-	-	0	0
-		100	7/2
-			M

Description: Number of global grinding frames.
The value corresponds to the number of field elements for the predefined field \$P_GFR[].
If the value of the data is greater than 0, all settable frames are only global.
MD28079 \$MC_MM_NUM_G_FRAMES is then ignored.

18660	MM_NUM_SYNACT_GUD_REAL	N02	-
-	Number of configurable GUD variables of type REAL	DWORD	PowerOn
-			
-	9	0, 0, 0, 0, 0, 0, 0, 0...	0
-		32767	7/2
-			M

Description: The MD18660 \$MN_MM_NUM_SYNACT_GUD_REAL[] can be used to extend individual GUD blocks by additional channel-specific parameter areas of type REAL. The GUD blocks are differentiated by the field index:
MD18660 \$MN_MM_NUM_SYNACT_GUD_REAL[0] = <value> -> extension of the SGUD block
MD18660 \$MN_MM_NUM_SYNACT_GUD_REAL[1] = <value> -> extension of the MGUD block
MD18660 \$MN_MM_NUM_SYNACT_GUD_REAL[2] = <value> -> extension of the UGUD block
MD18660 \$MN_MM_NUM_SYNACT_GUD_REAL[3] = <value> -> extension of the GUD4 block
MD18660 \$MN_MM_NUM_SYNACT_GUD_REAL[8] = <value> -> extension of the GUD9 block
In each case, fields with the following properties are created:
Data type REAL
Field size corresponding to <value> of the relevant machine data
Predefined names:
SYG_RS[] -> Synact parameter of type REAL in the SGUD block
SYG_RM[] -> Synact parameter of type REAL in the MGUD block
SYG_RU[] -> Synact parameter of type REAL in the UGUD block
SYG_R4[] -> Synact parameter of type REAL in the GUD4 block
....
SYG_R9[] -> Synact parameter of type REAL in the GUD9 block
The parameters can be read and written both by the part program and also via synchronous actions.

18661	MM_NUM_SYNACT_GUD_INT	N02	-
-	Number of configurable GUD variables of type integer	DWORD	PowerOn
-			
-	9	0, 0, 0, 0, 0, 0, 0, 0...	0
-		32767	7/2
-			M

Description: The MD18661 \$MN_MM_NUM_SYNACT_GUD_INT[] can be used to extend individual GUD blocks by additional channel-specific parameter areas of type INTEGER. The GUD blocks are differentiated by the field index:
MD18661 \$MN_MM_NUM_SYNACT_GUD_INT[0] = <value> -> extension of the SGUD block
MD18661 \$MN_MM_NUM_SYNACT_GUD_INT[1] = <value> -> extension of the MGUD block
MD18661 \$MN_MM_NUM_SYNACT_GUD_INT[2] = <value> -> extension of the UGUD block
MD18661 \$MN_MM_NUM_SYNACT_GUD_INT[3] = <value> -> extension of the GUD4 block
MD18661 \$MN_MM_NUM_SYNACT_GUD_INT[8] = <value> -> extension of the GUD9 block
In each case, fields with the following properties are created:
Data type BOOL

Field size corresponding to <value> of the relevant machine data

Predefined names:

SYG_IS[] -> Synact parameter of type INT in the SGUD block

SYG_IM[] -> Synact parameter of type INT in the MGUD block

SYG_IU[] -> Synact parameter of type INT in the UGUD block

SYG_I4[] -> Synact parameter of type INT in the GUD4 block

....

SYG_I9[] -> Synact parameter of type INT in the GUD9 block

The parameters can be read and written both by the part program and also via synchronous actions.

18662	MM_NUM_SYNACT_GUD_BOOL			N02	-	
-	Number of configurable GUD variables of type Boolean			DWORD	PowerOn	
-						
-	9	0, 0, 0, 0, 0, 0, 0, 0...	0	32767	7/2	M

Description:

The MD18662 \$MN_MM_NUM_SYNACT_GUD_BOOL[] can be used to extend individual GUD blocks by additional channel-specific parameter areas of type Boolean. The GUD blocks are differentiated by the field index:

MD18662 \$MN_MM_NUM_SYNACT_GUD_BOOL[0] = <value> -> extension of the SGUD block

MD18662 \$MN_MM_NUM_SYNACT_GUD_BOOL[1] = <value> -> extension of the MGUD block

MD18662 \$MN_MM_NUM_SYNACT_GUD_BOOL[2] = <value> -> extension of the UGUD block

MD18662 \$MN_MM_NUM_SYNACT_GUD_BOOL[3] = <value> -> extension of the GUD4 block

MD18662 \$MN_MM_NUM_SYNACT_GUD_BOOL[8] = <value> -> extension of the GUD9 block

In each case, fields with the following properties are created:

Data type BOOL

Field size corresponding to <value> of the relevant machine data

Predefined names:

SYG_BS[] -> Synact parameter of type Boolean in the SGUD block

SYG_BM[] -> Synact parameter of type Boolean in the MGUD block

SYG_BU[] -> Synact parameter of type Boolean in the UGUD block

SYG_B4[] -> Synact parameter of type Boolean in the GUD4 block

....

SYG_B9[] -> Synact parameter of type Boolean in the GUD9 block

The parameters can be read and written both by the part program and also via synchronous actions.

18663	MM_NUM_SYNACT_GUD_AXIS			N02	-	
-	Number of configurable GUD variables of type Axis			DWORD	PowerOn	
-						
-	9	0, 0, 0, 0, 0, 0, 0, 0...	0	32767	7/2	M

Description:

The MD18663 \$MN_MM_NUM_SYNACT_GUD_AXIS[] can be used to extend individual GUD blocks by additional channel-specific parameter areas of type AXIS. The GUD blocks are differentiated by the field index:

MD18663 \$MN_MM_NUM_SYNACT_GUD_AXIS[0] = <value> -> extension of the SGUD block

MD18663 \$MN_MM_NUM_SYNACT_GUD_AXIS[1] = <value> -> extension of the MGUD block

MD18663 \$MN_MM_NUM_SYNACT_GUD_AXIS[2] = <value> -> extension of the UGUD block

MD18663 \$MN_MM_NUM_SYNACT_GUD_AXIS[3] = <value> -> extension of the GUD4 block

MD18663 \$MN_MM_NUM_SYNACT_GUD_AXIS[8] = <value> -> extension of the GUD9 block

In each case, fields with the following properties are created:

Data type AXIS

2.3 NC machine data

Field size corresponding to <value> of the relevant machine data

Predefined names:

SYG_AS[] -> Synact parameter of type AXIS in the SGUD block

SYG_AM[] -> Synact parameter of type AXIS in the MGUD block

SYG_AU[] -> Synact parameter of type AXIS in the UGUD block

SYG_A4[] -> Synact parameter of type AXIS in the GUD4 block

....

SYG_A9[] -> Synact parameter of type AXIS in the GUD9 block

The parameters can be read and written both by the part program and also via synchronous actions.

18664	MM_NUM_SYNACT_GUD_CHAR			N02	-	
-	Configurable GUD variable of type Char			DWORD	PowerOn	
-						
-	9	0, 0, 0, 0, 0, 0, 0, 0...	0	32767	7/2	M

Description:

The MD18664 \$MN_MM_NUM_SYNACT_GUD_CHAR[]

can be used to extend individual GUD blocks by additional channel-specific parameter areas of type CHAR.

The GUD blocks are differentiated by the field index:

MD18664 \$MN_MM_NUM_SYNACT_GUD_CHAR[0] = <value> -> extension of the SGUD block

MD18664 \$MN_MM_NUM_SYNACT_GUD_CHAR[1] = <value> -> extension of the MGUD block

MD18664 \$MN_MM_NUM_SYNACT_GUD_CHAR[2] = <value> -> extension of the UGUD block

MD18664 \$MN_MM_NUM_SYNACT_GUD_CHAR[3] = <value> -> extension of the GUD4 block

MD18664 \$MN_MM_NUM_SYNACT_GUD_CHAR[8] = <value> -> extension of the GUD9 block

In each case, fields with the following properties are created:

Data type CHAR

Field size corresponding to <value> of the relevant machine data

Predefined names:

SYG_CS[] -> Synact parameter of type CHAR in the SGUD block

SYG_CM[] -> Synact parameter of type CHAR in the MGUD block

SYG_CU[] -> Synact parameter of type CHAR in the UGUD block

SYG_C4[] -> Synact parameter of type CHAR in the GUD4 block

....

SYG_C9[] -> Synact parameter of type CHAR in the GUD9 block

The parameters can be read and written both by the part program and also via synchronous actions.

18665	MM_NUM_SYNACT_GUD_STRING			N02	-	
-	Configurable GUD variable of type STRING			DWORD	PowerOn	
-						
-	9	0, 0, 0, 0, 0, 0, 0, 0...	0	25	7/2	M

Description:

The MD18665 \$MN_MM_NUM_SYNACT_GUD_STRING[] can be

used to extend individual GUD blocks by additional channel-specific parameter areas of type STRING.

The GUD blocks are differentiated by the field index:

MD18665 \$MN_MM_NUM_SYNACT_GUD_STRING[0] = <value> -> extension of the SGUD block

MD18665 \$MN_MM_NUM_SYNACT_GUD_STRING[1] = <value> -> extension of the MGUD block

MD18665 \$MN_MM_NUM_SYNACT_GUD_STRING[2] = <value> -> extension of the UGUD block

MD18665 \$MN_MM_NUM_SYNACT_GUD_STRING[3] = <value> -> extension of the GUD4 block

MD18665 \$MN_MM_NUM_SYNACT_GUD_STRING[8] = <value> -> extension of the GUD9 block

In each case, fields with the following properties are created:

Data type STRING

Field size corresponding to <value> of the relevant machine data

The maximum length of a string is 31 characters.

Predefined names:

SYG_SS[] -> Synact parameter of type STRING in the SGUD block

SYG_SM[] -> Synact parameter of type STRING in the MGUD block

SYG_SU[] -> Synact parameter of type STRING in the UGUD block

SYG_S4[] -> Synact parameter of type STRING in the GUD4 block

....

SYG_S9[] -> Synact parameter of type STRING in the GUD9 block

The parameters can be read and written both by the part program

and also via synchronous actions.

18700	MM_SIZEOF_LINKVAR_DATA	N02	B3
-	Size of NCU-link variable memory	DWORD	PowerOn
LINK, -			
-	-	0	0
		1073741824	7/2
			M

Description:

Number of bytes of the NCK link memory for the variables \$A_DLx.

Note: If the number of addressable NCU link variables exceeds the value 32767, variables with an index greater than this limit cannot be visualized in the diagnostic display, etc. However they are still functionally available.

18710	MM_NUM_AN_TIMER	N02	-
-	Number of global time variable for synchronized actions	DWORD	PowerOn
-			
-	-	0	0
		10000	7/2
			M

Description:

Number of global time variables for motion-synchronous actions (DRAM)

18720	MM_SERVO_FIFO_SIZE	EXP, N01	B3
-	Setpoint value for buffer size between IPO and position control	DWORD	PowerOn
-			
-	-	2	2
		35	3/2
			M

Description:

The machine data determines the size of the setpoint value buffer between interpolator and position control, and has a direct effect on the dynamic user memory requirement.

That is normally 2. If several NCUs are connected via NCU link for e.g. rotary indexing machines, the value should be set to 3 on all NCUs. This will balance the transmission rates of the setpoint values via the link.

In a master value application (e.g. line shaft), the value should be set to 4, but only on the NCU that generates the master value. For all the other NCUs, the preset value should be maintained at 2.

Note:

In control loops that are connected via interpolator, every increase of the value generates a further dead-time.

When the IPO cycles of the NCUs within an NCU group are set to different values, the link communication will only run in the slowest IPO cycle. The MD must be increased in the ratio of the NCU IPO cycle to the slowest IPO cycle in the NCU group, in order to achieve a synchronized output of the setpoint values on the drive interface. The formula for this is as follows:

$$MM_SERVO_FIFO_SIZE = 2 * IPO \text{ cycle ratio} + 1$$

2.3 NC machine data

Example:

In an IPO cycle ratio of 4:1, the value on the fast NCU should be set to 9 instead of 3. On the slow NCU, the value must be set to 3.

18730	MM_MAXNUM_ALARM_ACTIONS			N02	-	
-	Length of the alarm action list			DWORD	PowerOn	
-						
-	-	500	100	2000	1/1	M

Description: Maximum number of alarm actions that are retained. This is the length of the alarm action list.

18780	MM_NCU_LINK_MASK			N01	B3	
-	Activation of NCU-link communication			UDWORD	PowerOn	
-						
-	-	0	0	0x7	3/2	M

Description: Activating NCU link communication
Bit-coded activation data. That is the NCU link communication can be activated in various forms.

Bit-coded activation data:

Bit 0 = 0x1: Link communication is to be activated.

Bit 1 = 0x2: reserved

Bit 2 = 0x4: Extended search for link SDBs

SDBs are additionally searched for in the following directories:

-/user/sinumerik/sdb/...

-/oem/sinumerik/sdb/...

-/addon/sinumerik/sdb/...

As usual it is first searched in the user, oem, addon directories and then in the siemens directory

(See description FAST_IPO_LINK)

Irrelevant for:

Systems without link modules

18781	NCU_LINK_CONNECTIONS			N01	B3	
-	Number of internal link connections			DWORD	PowerOn	
LINK, -						
-	-	0	0	32	3/1	M

Description: Value = 0
The software calculates the internal link connections itself.
Value > 0
Number of internal link connections from each NCU to each other NCU.
These link connections do not accommodate the non-cyclic messages.
Each of these connections can transfer 240 bytes of raw data.
Non-cyclic messages occur with alarms, container switches and link variablen.

18782	MM_LINK_NUM_OF_MODULES			N01, N02	B3	
-	Number of NCU-link modules			UDWORD	PowerOn	
-						
-	-	2	2	16	3/2	M

Description: LINK_NUM_OF_MODULES defines how many link modules can participate in the link communication.

18788	MM_CC_STATION_CHAN_MASK			N01	-	
-	Channel bit mask for allocating CC stations			UDWORD	PowerOn	
-						
-	3	1, 0, 0	0	0x7FFFFFFF	1/1	M

Description: Machine data for channel-specific creation of special additional software stations for compile cycles.

Enter a bit mask with the bits set for the channels, in which a compile cycle shall use the relevant station.

Meaning of the individual array elements:

MD18788 \$MN_MM_CC_STATION_CHAN_MASK[0]:

Creates a CC station at the end of the geometry preparation and prior to velocity planning in the preparation task. A compile cycle application can buffer the blocks there and manipulate their contents.

MD18788 \$MN_MM_CC_STATION_CHAN_MASK[1]:

Creates another CC-Station that is called directly after the first CC station (see above) and permits the internal block contents independently of this manipulation.

MD18788 \$MN_MM_CC_STATION_CHAN_MASK[2]:

Creates an additional CC station in the preparation task that is called directly prior to tool radius offset and allows manipulation of the internal block contents.

18790	MM_MAX_TRACE_LINK_POINTS			EXP, N02, N06	B3	
-	Trace data buffer size for NCU-Link			DWORD	PowerOn	
NBUP						
-	-	8	0	20000	2/2	M

Description: MM_MAX_TRACE_LINK_DATAPOINTS defines the size of an internal data buffer which contains the trace recordings for the NCU-link functionality.

The MD is only evaluated if bit 0 is set in MD18792 \$MN_MM_TRACE_LINK_DATA_FUNCTION.

Related to:

MD22708 \$MC_TRACE_SCOPE_MASK,

MD22712 \$MC_TRACE_VARIABLE_INDEX,

MD18792 \$MN_MM_TRACE_LINK_DATA_FUNCTION

18792	MM_TRACE_LINK_DATA_FUNCTION			EXP, N02, N06	B3	
-	Specifies the contents of the NCU-link-trace files			UDWORD	PowerOn	
NBUP						
-	-	0	0	0x7FFFFFFF	2/2	M

2.3 NC machine data

Description:

The NCK link sends and receives 32 buffers with a length of 240 bytes in each interpolation cycle.

These buffers are saved in a FIFO (first in-first out) memory of length MD18790 \$MN_MM_MAX_TRACE_LINK_POINTS and written to a file (ncsctr01.mpf for the 1st channel) if a "trigger event" occurs (e.g. Cancel Alarm button, see MD22704 \$MC_TRACE_STOPTRACE_EVENT and MD22700 \$MC_TRACE_STARTTRACE_EVENT).

The machine data should be interpreted as a bit mask and has the following meaning:

BIT0 = 1

Enables the NCU link trace file.

The others are only evaluated if this bit is set!

MD18790 \$MN_MM_MAX_TRACE_LINK_POINTS is only evaluated with this bit.

BIT1 = 1

The stored buffer content is analyzed according to its meaning and written to the file in plain text. This means setpoint transfer can be detected, for example, from the text items "desVal", actual value transfer from the identifiers "actVal" etc.

BIT1 = 0

The buffer content is displayed in HEX and is not analyzed.

BIT2 = 1

Only buffers that contain a sporadically occurring communication message (dynamic message) between the NCUs are recorded.

These include, for example, the following events:

- Set machine data
- Set link variables
- Alarms spanning NCUs
- Axis container rotation

BIT3 = 1

Every addition and deletion of a CLEARHIMSELF alarm transferred via LINK triggers the following action:

The internal receive tree is recorded before and after the action and the most recent values can be

found again in trace.

NOTICE: Very very time-consuming; please only use in an emergency.

18794	MM_TRACE_VDI_SIGNAL			EXP, N02, N06	-	
-	Trace specification of VDI signals			UDWORD	PowerOn	
NBUP						
-	-	0	0	0x7FFFFFFF	2/2	M

Description:

The NCK sends and receives PLC VDI signals. The Trace function stores the signals which have changed in each interpolation cycle in an FIFO memory (first in-first out) having a size of MM_MAX_TRACE_POINTS.

The FIFO is written to a file (for the 1st channel: ncsctr01.mpf) when a "trigger event" occurs (e.g. Cancel Alarm key, see MD22704 \$MC_TRACE_STOPTRACE_EVENT and MD22700 \$MC_TRACE_STARTTRACE_EVENT).

The machine data should be interpreted as bit mask. The corresponding VDI signals are recorded depending on which bit is set.

Bits 1.. 6 describe which axial VDI input signals are recorded in the trace

(see .. TRACE_DATA_FUNCTION).

18800	MM_EXTERN_LANGUAGE			N01, N12	K1	
-	Activation of external NC languages			UDWORD	PowerOn	
-						
-	-	0x0000	0x0000	0x0001	7/2	M

Description: The corresponding NC language must be activated to execute part programs of other control manufacturers. Only one external NC language can be selected. The range of instructions which is made available in each case is to be taken from the current documentation.

Bit 0 (LSB):

Execution of part programs ISO_2 or ISO_3.

See MD10880 \$MN_MM_EXTERN_CNC_SYSTEM for coding.

18860	MM_MAINTENANCE_MON			EXP, N01	W6	
-	Activation of maintenance data recording			BOOLEAN	PowerOn	
-						
-	-	FALSE	0	-	7/2	M

Description: Maintenance data is recorded when this MD has the value TRUE.
The axial MD33060 \$MA_MAINTENANCE_DATA sets which data are to be recorded.
Details are to be found in the service documentation.

18866	MM_NUM_KIN_TRAFOS			N02, N09	W1	
-	Maximum number of transformations that can be defined by kinematic chains.			DWORD	PowerOn	
-						
-	-	0	0	200	7/2	M

Description: This machine data defines the maximum number of transformations in the NCK that can be defined by kinematic chains.
It also defines the number of data sets (\$NT_...[1] to \$NT_...[\$MN_MM_NUM_KIN_TRAFOS] available for parameterizing these transformations. The data record with index 0 is locked.)
The kinematic transformations conventionally parameterized in machine data can exist irrespective of this.

18880	MM_MAXNUM_KIN_CHAIN_ELEM			EXP, N01	-	
-	Maximum number of elements in kinematic chains			DWORD	PowerOn	
-						
-	-	0	0	1000	7/2	I

Description: Maximum number of links in kinematic chains. If this MD has the value 0 (default value) then no kinematic chains at all are possible.

18882	MM_MAXNUM_KIN_SWITCHES			EXP, N01	-	
-	Maximum number of switches in the kinematic chains			DWORD	PowerOn	
-						
-	-	1	1	200	7/2	I

Description: Maximum number of switches in the kinematic description of a machine.
This machine data is only evaluated if the machine data MD18880 \$MN_MM_MAXNUM_KIN_CHAIN_ELEM is not equal to zero.

18890	MM_MAXNUM_3D_PROT_AREAS			EXP, N01	-	
-	Maximum number of 3D protection areas			DWORD	PowerOn	
-						
-	-	0	0	200	7/2	M

Description: Maximum number of protection areas. This MD must not be equal to 0 in order to activate the function "collision avoidance".

2.3 NC machine data

18891	MM_MAXNUM_3D_WPFX_PROT_ELEM			EXP, N01	-	
-	Maximum number of protection area elements for WORKPIECE and FIXTURE			DWORD	PowerOn	
-						
-	-	0	0	500	7/2	M

Description: Maximum number of protection area elements for the automatic generation of protection areas with the language commands WORKPIECE and FIXTURE.

18892	MM_MAXNUM_3D_PROT_AREA_ELEM			EXP, N01	-	
-	Max. number of protection zone elements			DWORD	PowerOn	
-						
-	-	0	0	1000	7/2	M

Description: Maximum number of protection zone elements. If this MD is 0 (default value), no protection zones are possible.

18893	MM_MAXNUM_3D_T_PROT_ELEM			EXP, N01	-	
-	Max. number of tool protection area elements			DWORD	PowerOn	
-						
-	-	0	0	500	7/2	M

Description: Maximum number of protection area elements for automatic creation of tool protection areas.

18894	MM_MAXNUM_3D_FACETS_INTERN			EXP, N01	-	
-	Max. number of protection zone facets ro variable protection zones			DWORD	PowerOn	
-						
-	-	0	0	5000	7/2	M

Description: Maximum number of facets permitted for all internally created protection zones.
Only applies if MAXNUM_3D_PROT_AREAS is greater than zero and bit 0 in PROT_AREA_TOOL_MASK is set.
Typical values would then be 1000 for milling machines with a modeled tool, and 5000 for lathes with various tool types in a turret.

18895	MM_MAXNUM_3D_FACETS			EXP, N01	-	
-	Max. number of protection area facets/primitives			DWORD	PowerOn	
-						
-	-	0	0	5000	7/2	M

Description: Maximum number of primitives and facets allowed for all protection areas.
Only applies if MAXNUM_3D_PROT_AREAS is greater than zero.

18896	MM_MAXNUM_3D_COLLISION			EXP, N01	-	
-	Max. number of the memory location for collision check			DWORD	PowerOn	
-						
-	-	-	0	50000	7/2	M

Description: Maximum size of a temporary memory area (in KB), which is required for the collision check of two protection zones.
If the contents of this machine data is 0, the required memory space is determined automatically from machine data MD18892 \$MN_MM_MAXNUM_3D_PROT_AREA_ELEM, MD18890 \$MN_MM_MAXNUM_3D_PROT_AREAS and MD18895 \$MN_MM_MAXNUM_3D_FACETS.
If the determined memory space is insufficient, it can be explicitly determined using this machine data.

18897	MM_MAXNUM_3D_INTERFACE_IN	EXP, N01	-
-	Max. no. of interf. bits for pre-activation of protection zones	DWORD	PowerOn
-			
-	-	16	0
-	-	64	7/2
-	-	-	M

Description: Defines how many input bits are available on the VDI interface for pre-activation of 3D protection zones.

It will influence the size of the memory space required for each NC block.

If this machine data has value n , a memory size of approximately $n * (n + 1) / 16$ bytes will be required per block.

This machine data will be evaluated and will cause reservation of memory space, only if MD18890 \$MN_MM_MAXNUM_3D_PROT_AREAS is unequal to 0.

18898	MM_MAXNUM_3D_COLL_PAIRS	EXP, N01	-
-	Maximum number of 3D collision pairs	DWORD	PowerOn
-			
-	-	0	0
-	-	100	7/2
-	-	-	M

Description: Maximum number of 3D collision pairs.

This machine data is only evaluated if MD18890 \$MN_MAX_NUM_3D_PROT_AREAS is not equal to zero.

If this machine data is zero and MD18890 \$MN_MAX_NUM_3D_PROT_AREAS is not equal to zero, memory space is automatically reserved for the maximum possible number of different 3D collision pairs ($\$MN_MAX_NUM_3D_PROT_AREAS * (\$MN_MAX_NUM_3D_PROT_AREAS - 1) / 2$).

If the content of this machine data is greater than the specified maximum value, then it is limited to this maximum value internally without an error message.

18899	PROT_AREA_TOOL_MASK	EXP	-
-	Controls the creation of automatically created tool protection areas	DWORD	NEW CONF
-			
-	-	0	-
-	-	-	7/3
-	-	-	U

Description: Controls the way tool protection areas are automatically created with collision detection active.

If bit 0 = 1, then in MD 18894 \$MN_MM_MAXNUM_3D_FACETS_INTERN memory space must be reserved.

This machine data is bit-coded.

Bit 0 (0x1) If no other data are available, create the tool protection area from the tool data (tool length and radius).

18930	COREFILE_NAME	EXP	-
-	Path for core file creation	STRING	PowerOn
NBUP			
-	-	-	-
-	-	-	7/1
-	-	-	M

Description: File name with path name under which a core file is created in the case of a control crash.

The core file is used for problem analysis by NCK development.

A core file will be created, if a valid file name is entered in this MD.

2.3 NC machine data

18960	POS_DYN_MODE			N01	K1	
-	Type of positioning axis dynamic response			BYTE	Reset	
-						
-	-	0	0	1	7/2	M

Description: The machine data determines the accelerations and jerks which are applied in the case of positioning axis motion.

Value 0:

The acceleration is taken from the first field entry in MD32300 \$MA_MAX_AX_ACCEL (value for DYNNORM).

With G75 and active jerk limitation (SOFT), the jerk is taken from the first field entry in MD32431 \$MA_MAX_AX_JERK (value for DYNNORM); without jerk limitation (BRISK) it is infinite.

The following applies for all other positioning axis movements:

If MD32420 \$MA_JOG_AND_POS_JERK_ENABLE is true, the jerk is taken from MD32430 \$MA_JOG_AND_POS_MAX_JERK; otherwise it is infinite (BRISK behavior).

Value 1:

The acceleration is taken from the second field entry in MD32300 \$MA_MAX_AX_ACCEL (value for DYNPOS).

The jerk is taken from the second field entry in MD32431 \$MA_MAX_AX_JERK (value for DYNPOS).

For BRISK behavior, enter very high values here.

18965	SIM_ENVIRONMENT			EXP	-	
-	Defining the simulation environment			UDWORD	PowerOn	
NBUP, NDLD						
-	-	0x0	0	0x7	ReadOnly	S

Description: Bit mask to define the simulation environment:

Bit no. Hexadec. Significance when the bit is set.

Value

Bit0: 0x1 Simulation runs on a SIMNCK

Bit1: 0x2 Simulation runs under the VNCK

Bit2: 0x4 Simulation runs under an HMI

19010	SYSTEM_INFO			N01	-

840dsl-721	-	4	0	31	3/3	I
840dsl-731	-	4	0	31	3/3	I

Description:

Number of simultaneously interpolating path axes

If more interpolating axes are programmed than are permitted in OD19110 \$ON_NUM_IPO_AXES,

an alarm is output and the corresponding block is not executed.

Note: The input range is restricted for systems not subject to an export restriction.

19120	NUM_SAFE_AXES			N01, N06	-	
-	SI axis/spindle, add. 1 axis/spindle			BYTE	PowerOn	
-						
-	-	1	0	31	3/3	I

Description:

Number of axes in which 'NC-based' safety functions can be activated.

19121	NUM_DRIVEBASED_SAFE_AXES	N01, N06	-
-	Safety Integrated - axis/spindle	BYTE	PowerOn
-			
-	-	0	0
		31	3/3
			U

Description: Number of axes in which drive-based safety functions can be activated.

19122	NUM_SPL_IO	N01, N06	-
-	SI, identifier for the number of ext. SPL_I/O	BYTE	PowerOn
-			
-	-	-	0
		2	3/3
			I

Description: The number of external SPL I/Os can be selected with the value in the option data:
 = 0 : The SPL has no external I/Os.
 = 1 : The SPL has a maximum of 4/4 external I/Os.
 = 2 : The SPL has a maximum of 64/64 external I/Os.
 = 3 : The SPL has a maximum of 192/192 external I/Os

19142	NUM_LEAD_LINK_AXES	N01	-
-	Number of supported lead-link axes	BYTE	PowerOn
-			
-	-	0	0
		32	3/3
			I

Description: Number of lead link axes supported by the software

			10
			3/3
			I

Description: Number of activatable channels
 If more channels are activated by the global MD \$MN_ASSIGN_CHAN_TO_MODE_GROUP than are permitted in OD19200 \$ON_NUM_CHANNELS and OD19210 \$ON_NUM_ADD_CHANNELS, a power-up alarm is triggered which prevents the NC start.

19220	NUM_MODE_GROUPS	N01	-
-	Additional 1 operation mode modul (BAG)	BYTE	PowerOn
-			
-	-	1	1
		10	3/3
			I

Description: Number of mode groups
 If more mode groups are activated by the global MD \$MN_ASSIGN_CHAN_TO_MODE_GROUP than are permitted in \$ON_MODE_GROUPS, then a power-up alarm is triggered which prevents the NC start.

2.3 NC machine data

19250	USER_MEM_BUFFERED	N01, N02	-
-	Additional CNC user memory	BYTE	Immediately
-			
-	-	-	0 3 3/3 I

Description: Option data for enabling the expansion levels of the nonvolatile user memory on the NC CPU.

Available memory = basic configuration + OD19250 \$ON_USER_MEM_BUFFERED * 2MB

OD19250 \$ON_USER_MEM_BUFFERED thus always indicates the part of the memory relative to the basic configuration.

19270	PLC_USER_MEM_SIZE			N01, N02, N03	-	
-	Additional PLC user memory			BYTE	PowerOn	
-						
-	-	4	1	12	3/3	I

Description: Option data for enabling the additional PLC user memory

1 Minimal configuration

...

4 Basic configuration (512 kB)

5 GA + 128 kB

6 GA + 256 kB

7 GA + 384 kB

... etc.

12 GA + 1MB (maximum configuration)

19280	PLC_C_USER_MEM_SIZE			N01, N02, N03	-	
-	Additional 64 KB for PLC C programming			BYTE	PowerOn	
-						
-	-	0	0	14	3/3	I

Description: Option data for enabling the memory configuration stages for C programming on the PLC. (Incrementation: 64KB)

0 = No memory

1 = 64KB

..

14 = 896KB

19300	COMP_MASK			N01	-

Description: Functional scope of collision avoidance

Bit 0 (LSB): collision avoidance

The NCK internal collision avoidance is available and is supported by HMI Operate

Bit 1: Collision avoidance ECO

The NCK internal collision avoidance ECO is available and is supported by HMI Operate

Bit 2: Collision avoidance ADVANCED

The external and NCK internal collision avoidance is available but is not supported in HMI Operate

Support by HMI Operate is activated by setting bit 0 and/or bit 1

Bit 3: Multichannel collision avoidance

2.3.2 Channel-specific machine data

20000	CHAN_NAME			C01, C10	B3, K1	
-	Channel name			STRING	PowerOn	
-						
-	-	CHAN1, CHAN2, CHAN3, CHAN4, CHAN5, CHAN6, CHAN7, CHAN8...	-	-	7/2	M

Description: The channel name can be defined in this MD. The channel name is only used for the display on the HMI.

20050	AXCONF_GEOAX_ASSIGN_TAB			C01, C10	TE7, TE8, M1, R2, K1, K2	
-	Assignment of geometry axis to channel axis			BYTE	PowerOn	
-						
-	3	1, 2, 3, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0...	0	20	7/2	M

Description: This MD is used to specify which channel axis the geometry axis is assigned to. Each geometry axis must be assigned to a specific channel. If a geometry axis is not assigned to a channel axis, then this geometry axis is not available, and cannot be programmed (with the name defined under MD20060 \$MC_AXCONF_GEOAX_NAME_TAB).

For example: Turning machine without transformation:

MD20050 \$MC_AXCONF_GEOAX_ASSIGN_TAB[0] = 1 ; 1st geometry axis = 1st channel axis

MD20050 \$MC_AXCONF_GEOAX_ASSIGN_TAB[1] = 0 ; 2nd geometry axis not defined

MD20050 \$MC_AXCONF_GEOAX_ASSIGN_TAB[2] = 2 ; 3rd geometry axis = 2nd channel axis

The assignment made here is valid if no transformation is active. With active transformation n, the transformation-specific assignment table MD24...

\$MC_TRAFO_GEOAX_ASSIGN_TAB... becomes active.

20060	AXCONF_GEOAX_NAME_TAB			C01, C11, C10	F2, V2, M1, K2	
-	Geometry axis name in channel			STRING	PowerOn	
-						
-	3	X, Y, Z, X, Y, Z, X, Y, Z, X, Y, Z, X, Y, Z, X, Y, Z, X, Y, Z, X...	-	-	7/2	M

Description: This MD is used to enter the names of the geometry axes separately for each channel. Geometry axes can be programmed in the part program using the names specified here.

Special cases:

- The geometry axis name entered must not conflict with the designations and assignments of the machine and channel axis names or other identifiers.

Names for Euler angles (MD10620 \$MN_EULER_ANGLE_NAME_TAB),

Names for direction vectors (MD10640 \$MN_DIR_VECTOR_NAME_TAB),

Names for intermediate circle point coordinates for CIP (MD10660 \$MN_INTERMEDIATE_POINT_NAME_TAB) and the

Names for interpolation parameters (MD10650 \$MN_IPO_PARAM_NAME_TAB) coincide.

- Related to:

```
(machine axis name [axis no.]
```

```
(channel axis name in the channel [channel axis no.] )
```

20070	AXCONF_MACHAX_USED			C01, C10	TE3, B3, K5, M1, K1, K2, P3 pl, P3 sl, S1	
-	Machine axis number valid in channel			BYTE	PowerOn	
-						
-	20	1, 2, 3, 0, 0	0	31	7/2	M

This MD is used to specify the machine axis which the channel axis/special axis is assigned to. Each channel axis has to be assigned to a specific channel. A machine axis that has not been assigned to a channel is inactive, i.e. the axis control is not computed, the axis is not shown on the screen, and it cannot be programmed in any channel.

From software version 5, a machine axis need not be assigned to a channel axis for reasons of uniform configuration. The MD for the machine axis is set to 0 in this case. At the same time, MD11640 \$MN_ENABLE_CHAN_AX_GAP must be set to 1 (channel axis gaps are permitted).

From software version 5, the machine data MD20070 \$MC_AXCONF_MACHAX_USED does not directly refer to the machine axes created with MD10000 \$MN_AXCONF_MACHAX_NAME_TAB, but to the logical machine axis map which is defined with MD10002 \$MN_AXCONF_LOGIC_MACHAX_TAB.

MD10002 \$MN AXCONF LOGIC MACHAX TAB refers:

- directly to a local machine axis on the NCU,
- to a machine axis of another NCU in the NCU grouping or
- indirectly to an axis container with local or remote machine axes.

If the default values AX1, AX2, ..., AX31 are entered with MD10002

\$MN_AXCONF_LOGIC_MACHAX_TAB, then the NCK behaves in the same way as up to software version 4, this means that machine data MD20070 \$MC_AXCONF_MACHAX_USED refers to the corresponding local machine axis.

Special cases:

- Each geometry axis must be assigned to a channel axis and a machine axis so that it can be programmed.
- If a machine axis is assigned to several channels by means of MD20070 `$MC_AXCONF_MACHAX_USED`, then the number of the channel from which the axis is to be programmed must be entered in MD30550 `$MA_AXCONF_ASSIGN_MASTER_CHAN`.
- Up to software version 4, the list of entries must not contain any gaps (as from software version 5 - see above). In contrast, the assignment of the machine axes used may contain gaps.

For example:

Permissible:

AXCONF_MACHAX_USED [0] = 3; 3rd MA is the 1st axis in the channel
 AXCONF_MACHAX_USED [1] = 1; 1st MA is the 2nd axis in the channel
 AXCONF_MACHAX_USED [2] = 5; 5th MA is the 3rd axis in the channel
 AXCONF_MACHAX_USED [3] = 0

Error for software version 4, permissible for version 5:

AXCONF_MACHAX_USED [0] = 1; 1st MA is the 1st axis in the channel
 AXCONF_MACHAX_USED [1] = 2; 2nd MA is the 2nd axis in the channel
 AXCONF_MACHAX_USED [2] = 0; gap in the list ...
 AXCONF_MACHAX_USED [3] = 3; ... of the channel axes

Axis identifiers must be defined in the corresponding list places of
 AXCONF_CHANAX_NAME_TAB for the axes activated in the channel.

MD30550 \$MA_AXCONF_ASSIGN_MASTER_CHAN

MD20080 \$MC_AXCONF_CHANAX_NAME_TAB

MD10002 \$MN_AXCONF_LOGIC_MACHAX_TAB

MD11640 \$MN_ENABLE_CHAN_AX_GAP

Reference:

Description of Functions B3.

20080	AXCONF_CHANAX_NAME_TAB			C01, C11, C10	F2, V2, M1, K2, V1	
-	Channel axis name in channel			STRING	PowerOn	
-						
-	20	X, Y, Z, A, B, C, U, V, X11, Y11,, X, Y, Z, A, B, ...	-	-	7/2	M

Description:

The name of the channel axis/special axis is entered in this MD. Normally the first three channel axes are assigned by the three assigned geometry axes

(see also MD20050 \$MC_AXCONF_GEOAX_ASSIGN_TAB)

The remaining channel axes are also called special axes. The channel axis/special axis on the screen in the WCS (workpiece coordinate system) is always displayed with the name entered in this MD.

Special cases:

- The specified channel axis name/special axis name must not conflict with the designation and assignment of the machine and geometry axis names or other identifiers.

Names for Euler angles (MD10620 \$MN_EULER_ANGLE_NAME_TAB),

Names for direction vectors (MD10640 \$MN_DIR_VECTOR_NAME_TAB),

Names for intermediate circle point coordinates for CIP (MD10660 \$MN_INTERMEDIATE_POINT_NAME_TAB)

and the names for interpolation parameters (MD10650 \$MN_IPO_PARAM_NAME_TAB) overlap.

- Axis identifiers that are not allowed are rejected with an alarm during runup.

Description:

Only valid axis identifiers, empty string and "NO_AXIS" may be entered in MD20082 \$MC_AXCONF_CHANAX_DEFAULT_NAME. "NO_AXIS" is used to indicate a non-initialized axis variable, empty string means previous behavior, i.e. each variable is initialized with the 1st geometry axis.

Description:

The spindle defined in this MD is also declared as the master spindle at program end and program cancelation.

20092	SPIND_ASSIGN_TAB_ENABLE	C01, C03, C10	S1
-	Enable/disable the spindle converter.	BYTE	Reset
-			
-	-	0, 0, 0, 0, 0, 0, 0, 0...	0 1 7/7 U

Description:

Value 0:

The spindle converter function is deactivated. The contents of SD42800 \$SC_SPIND_ASSIGN_TAB[...] are not evaluated.

Value 1:

The spindle converter is activated. Conversion from logical to physical spindle takes place. For more information, see SD42800 \$SC_SPIND_ASSIGN_TAB.

Note:

The spindle converter is deactivated after "Delete SRAM" (service switch in position "1").

20096	T_M_ADDRESS_EXT_IS_SPINO			C01, C04, C09	H2, W1	
-	Meaning of address extension at T, M tool change			BOOLEAN	PowerOn	
-						
-	-	FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE...	0	-	7/2	M

Description:

This MD is only significant if the functions 'Tool management'/'flat D numbers' are inactive.

FALSE

The contents of the address extensions of the NC addresses T and M 'tool change command number' are not evaluated by the NCK. The PLC decides on the significance of the programmed extension.

TRUE

The address extensions of the NC addresses T and M 'tool change command number' - 'tool change command number'=TOOL_CHANGE_M_CODE with 6 as the default value - are interpreted as spindle numbers.

NCK treats the extension in the same way as the active functions 'tool management' and 'flat D number management'.

That is, the programmed D number always refers to the T number of the programmed main spindle number.

20100	DIAMETER_AX_DEF			C01, C10	H1, M5, P1, V1, W1	
-	Geometry axis with transverse axis function			STRING	PowerOn	
-						
-	-	-	-	-	7/2	M

Description:

This MD is used to define a geometry axis as a transverse axis. Only one transverse axis can be defined here for each channel.

Further transverse axes for axis-specific diameter programming can be activated via MD30460 \$MA_BASE_FUNCTION_MASK, bit 2.

The axis identifier of an active geometry axis that has been defined in the channel-specific MD20050 \$MC_AXCONF_GEOAX_ASSIGN_TAB[n]

or MD24120 \$MC_TRAFO_AX_GEOAX_ASSIGN_TAB_1[n] (from SW 4) and

MD20060 \$MC_AXCONF_GEOAX_NAME_TAB[n] must be specified.

If space characters are entered or if an axis identifier is specified for an axis which is not defined as a geometry axis, this leads to the following alarms:

2.3 NC machine data

- during runup, to alarm 4032 "Channel %1 wrong identifier for transverse axis in %2", if the "Diameter programming" function (DIAMON) or constant cutting speed G96/G961/G962 is the switch-on setting.
- when the "Diameter programming (DIAMON)" function is activated, to alarm 16510 "Channel %1 block %2 No transverse axis available for diameter programming", if no axis has been permitted via DIAMCHANA[AX] for channel-specific diameter programming.
- when G96/G961/G962 has been programmed, to alarm 10870 "Channel %1 block %2 No transverse axis defined as reference axis for G96/G961/G962", if no geometry axis has been defined as the reference axis for G96/G961/G962 by the instruction SCC[ax].

Prog-Event after ramp-up causes block change despite read-in disable

Bit 4 = 1 :
Prog-Event after 1st start after search run causes block change despite read-in disable

Bit 5 = 1 :
Safety-Prog-Event during ramp-up causes block change despite read-in disable

Corresponds to:

MD20105 \$MC_PROG_EVENT_IGN_REFP_LOCK
MD20106 \$MC_PROG_EVENT_IGN_SINGLEBLOCK
MD20108 \$MC_PROG_EVENT_MASK
MD20192 \$MC_PROG_EVENT_IGN_PROG_STATE
MD20193 \$MC_PROG_EVENT_IGN_STOP

2.3 NC machine data

20108	PROG_EVENT_MASK			N01	TE3, K1	
-	Setting of event-driven programm calls			UDWORD	PowerOn	
-						
-	-	0x0, 0x0, 0x0, 0x0, 0x0, 0x0, 0x0, 0x0...	0	0x3F	7/2	M

Description:

Parameterization of the events with which the user program (default: `_N_PROG_EVENT_SPF`) set with MD11620 `$MN_PROG_EVENT_NAME` is implicitly called.

Parameterization of the events causing the safety program `_N_SAFE_SPF` to be called implicitly:

Bit 0 = 1 : Start of part program

Bit 1 = 1 : End of part program

Bit 2 = 1 : Operator panel reset

Bit 3 = 1 : Ramp-up

Bit 4 = 1 : Reserved

Bit 5 = 1 : Safety program booting

The user program is called via the following search path:

1. `/_N_CUS_DIR/_N_PROG_EVENT_SPF`

2. `/_N_CMA_DIR/_N_PROG_EVENT_SPF`

3. `/_N_CST_DIR/_N_PROG_EVENT_SPF`

The safety program has to be available in the following location:

1. `/_N_CST_DIR/_N_SAFE_SPF`

Furthermore, MD11450 `$MN_SEARCH_RUN_MODE` bit 1 also causes the user program set with MD11620 `$MN_PROG_EVENT_NAME` to be started up automatically after the action blocks, regardless of the settings in this machine data.

Related to:

MD20105 `$MC_PROG_EVENT_IGN_REFP_LOCK`

MD20106 `$MC_PROG_EVENT_IGN_SINGLEBLOCK`

MD20107 `$MC_PROG_EVENT_IGN_INHIBIT`

MD20192 `$MC_PROG_EVENT_IGN_PROG_STATE`

MD20193 `$MC_PROG_EVENT_IGN_STOP`

Note:

The Siemens cycle package includes the cycle `/_N_CST_DIR/_N_PROG_EVENT_SPF`, that should be used by default to process the event-driven program calls. It contains subroutine calls for the particular manufacturer and end user applications (For details see the documentation "Standard cycle PROG-EVENT.SPF").

20109	PROG_EVENT_MASK_PROPERTIES			N01	K1

-						
-	-	0x0, 0x0, 0x0, 0x0, 0x0, 0x0, 0x0, 0x0...	0	0x1	7/2	M

Description:

Parameterization of additional properties of the event-controlled program calls (in short, Prog-Event), that is, the MD20108 `$MC_PROG_EVENT_MASK` is further parameterized.

Bit 0 = 1 :

An ASUB started from channel status RESET does not result in a Prog-Event.

20110	RESET_MODE_MASK			C11, C03	F2, K6, M3, TE4, W5, B3, K5, M1, G2, K1, K2, P1, S1, W1, 2.4, 2.7	
-	Definition of basic control settings after reset/part program end			UDWORD	Reset	
-						
-	-	0x1, 0x1, 0x1, 0x1, 0x1, 0x1, 0x1, 0x1...	0	0x17FFFF	7/2	M

Description:

Definition of the initial setting of the control after ramp-up and at reset/end-of-part-program with regard to the G codes (in particular the active plane and the settable work offset), tool length offset and transformation by setting the following bits:

Bit 0: Reset mode

Bit 1: Suppress aux. funct. output on tool selection

Bit 2: Select reset response after power-on (e.g. tool offset)

Bit 3: Select reset response after end of test mode with regard to active tool offsets.

Bit 4: Reserved

Bit 5: Reserved

Bit 6: Reset response "Active tool length offset"

Bit 7: Reset response "Active kinematic transformation"

Bit 8: Reset response "Coupled-motion axes"

Bit 9: Reset response "Tangential correction"

Bit 10: Reset response "Synchronous spindle"

Bit 11: Reset response "Revolutional feedrate"

Bit 12: Reset response "Geo axis replacement"

Bit 13: Reset response "Master value coupling"

Bit 14: Reset response "Basis frame"

Bit 15: Reset response "Electronic gearbox"

Bit 16: Reset response "Master spindle"

Bit 17: Reset response "Master toolholder"

Bit 18: Reset response "Reference axis for G96/G961/G962"

Bit 19: Reserved "Adjustable software limit switch ineffective"

Bit 20: Reset response "\$P_USEKT"

Bits 4 to 11, 16 and 17 are only evaluated for bit 0 = 1.

Meaning of the individual bits:

Bit 0 (LSB) = 0: corresponds to the behavior of SW release 1, is only recommended for test mode

Initial setting after ramp-up:

- G codes according to MD20150 \$MC_GCODE_RESET_VALUES

- Tool length offset not active

- Transformation not active

- No coupled-motion axis groupings active

- No tangential correction active

- No axial revolutional feedrate active

- Path revolutional feedrate with master spindle (default))

Initial setting after reset or end of part program:

The current settings are retained.

When next part program is started, the following initial setting is effective:

- G codes according to MD20150 \$MC_GCODE_RESET_VALUES

- Tool length offset not active

2.3 NC machine data

- Transformation not active
 - No coupled-motion axis groupings active
 - No tangential correction active
 - No master value coupling active
 - No axial revolutionary feedrate active
 - Path revolutionary feedrate with master spindle (default)
- Bit 0 (LSB) = 1: Standard value for Powerline and Solutionline systems
- Initial setting after startup:
- G codes acc. to MD20150 \$MC_GCODE_RESET_VALUES
 - Tool length offset active acc. to MD20120 \$MC_TOOL_RESET_VALUE, MD20130 \$MC_CUTTING_EDGE_RESET_VALUE, and MD20132 \$MC_SUMCORR_RESET_VALUE
 - Transformation active acc. to MD20140 \$MC_TRAFO_RESET_VALUE
 - Geometry axis replacement acc. to MD20118 \$MC_GEOAX_CHANGE_RESET
 - No coupled-motion axis groupings active
 - No tangential correction active

Initial setting after reset or end of part program:

Depending on MD20152 \$MC_GCODE_RESET_MODE, the current settings are retained for the G groups or the initial settings stored in MD20150\$MC_GCODE_RESET_VALUES are set.

Initial setting after reset or end of part program

Depending on MD20110 \$MC_RESET_MODE_MASK bits 6 to 7, for

- Tool length offset
- Transformation

either the current settings are retained or the initial settings saved in the MDs are set.

Depending on bits 8 and 9, the current settings of coupled-motion axes or tangentially corrected axes are either deactivated or retained.

Configured synchronous spindle coupling:

The coupling is deselected depending on the setting in MD21330 \$MC_COUPLE_RESET_MODE_1.

Non-configured synchronous spindle coupling:

Depending on bit 10, the coupling is either deactivated or retained.

Depending on bit 14, the basic frame is either retained or deselected.

Bit 1 = 0:

Auxiliary function output (D,T,M) at the PLC for tool selection corresponding to machine data

MD20120 \$MC_TOOL_RESET_VALUE

MD20130 \$MC_CUTTING_EDGE_RESET_VALUE

MD20121 \$MC_TOOL_PRESEL_RESET_VALUE

MD22550 \$MC_TOOL_CHANGE_MODE

When magazine management is active, T, M are not output as auxiliary functions.

The function uses its own communication to output T, M to the PLC, for example.

Bit 1 = 1:

Suppress aux. funct. output to PLC on tool selection.

If tool management or magazine management is active, T, M are never output as auxiliary functions.

Bit 2 = 0:

If tool or magazine management is not active:

- No tool offset active after power-on. Active and programmed T depend on the subsequent settings of the machine data (bits 0, 6).

If tool or magazine management is active:

- No meaning.

Bit 2 = 1:

If tool or magazine management is not active:

- If bits 0 and 6 both = 1 (0x41), the tool offset of the last tool active in the NCK is active after the first reset after power-on.

(The value of the programmed tool depends on the value of machine data MD20121 \$MC_TOOL_PRESEL_RESET_VALUE.)

Notice: The NCK does not know the conditions at the machine.

For active tool or magazine management:

- No meaning

Bit 3 = 0:

With and without active tool management:

- End of test mode: "Retain current setting for active tool length offset" (bits 0 and 6 set) refers to the program that was active before test mode was activated.

Bit 3 = 1:

Relevant only if tool management is not active:

- End of test mode: "Retain current setting for active tool length offset" (bits 0 and 6 set) refers to the program that was active when test mode ended. (If tool management is active, the tool on the spindle is generally the active tool. Exception only for MD20270 \$MC_CUTTING_EDGE_DEFAULT = -2.)

Bit 4 = 0: Reserved

Bit 4 = 1: Reserved

Bit 5 = 0: Reserved

Bit 5 = 1: Reserved

Bit 6 = 0:

Initial setting for active tool length offset after reset/end of part program acc. to MD20120 \$MC_TOOL_RESET_VALUE, MD20130 \$MC_CUTTING_EDGE_RESET_VALUE, MD20123 \$MC_USEKT_RESET_VALUE and MD20132 \$MC_SUMCORR_RESET_VALUE.

If MD22550 \$MC_TOOL_CHANGE_MODE = 1, the tool specified in MD20121 \$MC_TOOL_PRESEL_RESET_VALUE is additionally preselected.

If tool or magazine management is active, MD20122 \$MC_TOOL_RESET_NAME is used instead of data MD20120 \$MC_TOOL_RESET_VALUE.

Bit 6 = 1:

The current setting for active tool length offset is retained after reset/end of part program.

If tool or magazine management is active, the tool currently on the master spindle (generally = master toolholder) is selected.

If the tool on the master spindle is disabled, the "disabled" status is ignored.

Please note that after a program ends or is terminated, either the most recent value for master spindle or master toolholder programmed in the program, or the value set in MD20090 \$MC_SPIND_DEF_MASTER_SPIND or MD20124 \$MC_TOOL_MANAGEMENT_TOOLHOLDER defines the master spindle or master toolholder.

(The selection is made in bit 16 or bit 17.)

For MD20270 \$MC_CUTTING_EDGE_DEFAULT = -2, the following applies specifically:

If a tool has been loaded into the spindle, but a new offset D has not yet been programmed, the previous tool is still active in the NCK.

If machining is canceled in this status (e.g. with the Reset key), the offset is defined with the smallest D number of the master spindle tool.

Bit 7 = 0:

Initial setting for active transformation after reset/end of part program according to MD20140 \$MC_TRAFO_RESET_VALUE.

Bit 7 = 1:

The current setting for active transformation is retained after reset/end of part program.

2.3 NC machine data

Bit 8 = 0:

Coupled-motion axis groups are ungrouped at reset/end of part program.

Bit 8 = 1:

Coupled-motion axis groups remain active after reset/end of part program.

Bit 9 = 0:

Tangential correction is deactivated at reset/end of part program.

Bit 9 = 1:

Tangential correction remains active after reset/end of part program.

Bit 10 = 0:

Non-configured synchronous spindle coupling is deactivated at reset/end of part program.

Bit 10 = 1:

Non-configured synchronous spindle coupling remains active after reset/end of part program.

Bit 11 = 0:

At reset/end of part program, the setting data SD43300 \$SA_ASSIGN_FEED_PER_REV_SOURCE is reset to 0 for all non-active axes/spindles, i.e. traversing at revolutionary feedrate is canceled and the setting for path and synchronous axes is reset to the master spindle (default).

Bit 11 = 1:

The current setting for revolutionary feedrate is retained after reset/end of part program. At the start of the part program, the setting data SD43300 \$SA_ASSIGN_FEED_PER_REV_SOURCE is reset to 0 for all non-active axes/spindles, i.e. traversing at revolutionary feedrate is canceled and the setting for path and synchronous axes is reset to the master spindle (default).

Bit 12 = 0:

If machine data MD20118 \$MC_GEOAX_CHANGE_RESET is set, a changed geometry axis assignment is canceled at reset/end of part program. The initial setting for the geometry axis assignment defined in the machine data becomes active.

Bit 12 = 1:

A changed geometry axis assignment remains active after reset/end of part program.

Bit 13 = 0:

Master value couplings are canceled at reset/end of part program.

Bit 13 = 1:

Master value couplings remain active after reset/end of part program.

Bit 14 = 0:

The basic frame is deselected.

Bit 14 = 1:

The current setting of the basic frame is retained.

Bit 15 = 0:

Active electronic gearboxes remain active at reset/end of part program.

Bit 15 = 1:

Active electronic gearboxes are canceled at reset/end of part program.

Bit 16 = 0:

Initial setting for the master spindle according to MD20090 \$MC_SPIND_DEF_MASTER_SPIND.

Bit 16 = 1:

The current setting of the master spindle (SETMS) is retained.

For MD20124 \$MC_TOOL_MANAGEMENT_TOOLHOLDER = 0, this bit also influences the behavior of bit 6.

Bit 17 = 0:

Initial setting for the master toolholder according to MD20124

\$MC_TOOL_MANAGEMENT_TOOLHOLDER.

Bit 17 = 1:

The current setting of the master toolholder (SETMTH) is retained.

(Bit17 is only relevant for active tool or magazine management MD20124

\$MC_TOOL_MANAGEMENT_TOOLHOLDER > 0. Otherwise, the setting is valid for master spindle bit 16, for active tool or magazine management. This bit also influences the behavior of bit6.)

Bit 18 = 0:

Reference axis for G96/G961/G962 acc. to MD 20100: \$MC_DIAMETER_AX_DEF.

When using SCC for your own spindle reset, bit 18 = 1 is recommended (see also MD 20112 \$MC_START_MODE_MASK, bit 18).

Bit 18 = 1:

Reference axis for G96/G961/G962 is retained.

Bit 19: Reserved!

Bit 19= 0:

The two adjustable software limit switches are deleted after reset and are no longer effective.

Bit 19 = 1:

The two adjustable software limit switches remain active after reset.

Bit 20: Reset response for \$P_USEKT (use kind of tool)

Bit 20= 0:

After the RESET, \$P_USEKT is set to \$MC_USEKT_RESET_VALUE (default=0).

Bit 20 = 1:

On RESET, \$P_USEKT is retained.

20112	START_MODE_MASK			C03	K6, M3, K5, M1, K1, K2, P1, S1, W1	
-	Definition of basic setting of control after part program start			UDWORD	Reset	
-						
-	-	0x400, 0x400, 0x400, 0x400, 0x400, 0x400, 0x400...	0	0x7FFFF	7/2	M

Description:

The initial setting of the control at the start of the part program with respect to G codes (in particular, current plane and settable work offset), tool length offset, transformation, and axis couplings is defined by setting the following bits:

Bit 0: Start mode

Bit 1: Suppress aux. funct. output on tool selection

Bit 2: Not assigned, but reserved (see corresponding bit in RESET_MODE_MASK)

Bit 3: Not assigned, but reserved (see corresponding bit in RESET_MODE_MASK)

Bit 4: Start response for G code "Current plane"

2.3 NC machine data

Bit 5: Start response for G code "Settable work offset"
 Bit 6: Start response for "Active tool length offset"
 Bit 7: Start response for "Active kinematic transformation"
 Bit 8: Start response for "Coupled-motion axes"
 Bit 9: Start response for "Tangential correction"
 Bit 10: Start response for "Synchronous spindle"
 Bit 11: Not assigned, but reserved (see corresponding bit in RESET_MODE_MASK)
 Bit 12: Start response for "Geo axis replacement"
 Bit 13: Start response for "Master value coupling"
 Bit 14: Not assigned, but reserved (see corresponding bit in RESET_MODE_MASK)
 Bit 15: Not assigned, but reserved (see corresponding bit in RESET_MODE_MASK)
 Bit 16: Start response for "Master spindle"
 Bit 17: Start response for "Master toolholder"
 Bit 18: Start response for "Reference axis for G96/G961/G962"
 Bit 19: Reserved "Adjustable software limit switch ineffective"
 Bit 20: Reserved "\$P_USEKT reset response"

Meaning of individual bits:

Bit 0 = 0:

The bits 8 (TRAIL), 10 (COUP), bit 13 (LEAD) and bit 15 (EG) are evaluated on part program start and event-driven program calls of the Progevent ASUB

Bit 0 = 1:

The bits 8 (TRAIL), 10 (COUP), bit 13 (LEAD) and bit 15 EG) are evaluated only on part program start

Bit 1 = 0:

Auxiliary function output (D, T, M, DL) to PLC on tool selection according to the following MDs: MD20120 \$MC_TOOL_RESET_VALUE, MD20130 \$MC_CUTTING_EDGE_RESET_VALUE, MD20121 \$MC_TOOL_PRESEL_RESET_VALUE, and MD22550 \$MC_TOOL_CHANGE_MODE.

Note:

If tool or magazine management is active, only auxiliary functions D and DL are output.

Bit 1 = 1:

Suppress auxiliary function output to PLC on tool selection.

Bit 1 is not relevant if tool or magazine management is active.

Bit 2 : Reserved (reset response after power-on)

Bit 3 : Reserved (end of test mode)

Bit 4 = 0:

The current setting for G code "current plane" is retained.

Bit 4 = 1:

Initial setting for G code "current plane" according to MD20150 \$MC_GCODE_RESET_VALUES

Bit 5 = 0:

The current setting for G code "settable work offset" is retained.

Bit 5 = 1:

Initial setting for G code "settable work offset" according to MD20150 \$MC_GCODE_RESET_VALUES

Bit 6 = 0:

The current setting for active tool length offset is retained.

If tool or magazine management is active, the tool currently on the active toolholder (spindle) is always selected.

If the tool that is currently on the spindle is disabled, it is automatically replaced by a suitable replacement tool.

If such a replacement tool does not exist, an alarm is output.

Bit 6 = 1:
Initial setting for active tool length offset according to MD20120 \$MC_TOOL_RESET_VALUE, MD20130 \$MC_CUTTING_EDGE_RESET_VALUE, MD20123 \$MC_USEKT_RESET_VALUE, and MD20132 \$MC_SUMCORR_RESET_VALUE.
If MD22550 \$MC_TOOL_CHANGE_MODE = 1, the tool selected via MD20121 \$MC_TOOL_PRESEL_RESET_VALUE is preselected in addition.
If tool or magazine management is active, MD20120 \$MC_TOOL_RESET_NAME is used instead of MD20122 \$MC_TOOL_RESET_VALUE.

Bit 7 = 0:
The current setting for the active transformation is retained.

Bit 7 = 1:
Initial setting for active transformation after reset/end of part program according to MD20140 \$MC_TRAFO_RESET_VALUE

Bit 8 = 0:
Coupled-motion axis groupings remain active.

Bit 8 = 1:
Coupled-motion axis groupings are deactivated.

Bit 9 = 0:
Tangential correction remains active.

Bit 9 = 1:
Tangential correction is deactivated.

Bit 10 = 0:
Non-configured synchronous spindle coupling remains active.

Bit 10 = 1:
Non-configured synchronous spindle coupling is deactivated.

Bit 11 : Reserved (revolutional feedrate)

Bit 12 = 0:
A changed geometry axis assignment remains active when the part program starts.

Bit 12 = 1:
If machine data MD20118 \$MC_GEOAX_CHANGE_RESET is set, a changed geometry axis assignment is deleted when the part program starts.

Bit 13 = 0:
Master value couplings remain active.

Bit 13 = 1:
Master value couplings are deactivated.

Bit 14 : Reserved (basic frame)

Bit 15 = 0:
Active electronic gearboxes remain active.

Bit 15 = 1:
Active electronic gearboxes are deactivated.

Bit 16 = 0:
The current setting of the master spindle (SETMS) is retained.

Bit 16 = 1:
Initial setting for the master spindle according to MD20090 \$MC_SPIND_DEF_MASTER_SPIND

Bit 17 = 0:
The current setting of the master toolholder (SETMTH) is retained (relevant only if tool or magazine management is active)

Bit 17 = 1:
Only if MD20124 \$MC_TOOL_MANAGEMENT_TOOLHOLDER > 0: Initial setting for the master toolholder according to MD20124 \$MC_TOOL_MANAGEMENT_TOOLHOLDER.
Otherwise, the setting for the master spindle applies.

2.3 NC machine data

Bit 18 = 0:

Reference axis for G96/G961/G962 according to MD20100 \$MC_DIAMETER_AX_DEF.

When using SCC with its own spindle reset, setting bit 18 = 1 is recommended (see also MD20110: \$MC_RESET_MODE_MASK, bit 18).

Bit 18 = 1:

Reference axis for G96/G961/G962 is retained.

20114	MODESWITCH_MASK			C03	K1	
-	Interruption MDI by mode change			UDWORD	Reset	
-						
-	-	0x0, 0x0, 0x0, 0x0, 0x0, 0x0, 0x0, 0x0...	0	0xFFFF	7/2	M

Description:

After program interruption in MDI mode (e.g. in order to carry out a measurement on the workpiece and to correct the tool wear values or after tool breakage) the tool can be manually withdrawn from the contour by changing into JOG mode.

In this case, the control stores the coordinates of the position of the interruption and indicates the path differences traversed by the axes in JOG mode as "Repos offset". When MDI mode is selected again, the axis is repositioned on the contour. This response can be canceled by means of this machine data.

Bit 0 (LSB) = 0:

When MDI (JOG, JOGREF, JOGREPOS, MDIREF and MDIREPOS) are deselected in stopped status, the system ASUB Repos is selected.

Bit 0 (LSB) = 1:

When MDI (JOG, JOGREF, JOGREPOS, MDIREF and MDIREPOS) are deselected in stopped status, the system ASUB Repos is not selected.

Bit 1 (LSB) = 0:

If the NCK stops at a part program block in the program execution in which repositioning is not possible, alarm 16916 is generated if an attempt is made to switch to manual mode.

Bit 1 (LSB) = 1:

If the NCK stops at a part program block in the program execution in which repositioning is not possible, no alarm is generated if an attempt is made to switch to manual mode.

2.3 NC machine data

20124	TOOL_MANAGEMENT_TOOLHOLDER			C03	H2, K1	
-	Tool holder number			DWORD	PowerOn	
-						
-	-	0, 0, 0, 0, 0, 0, 0, 0...	0	20	7/2	M

Description:

This MD is only relevant with tool management active.

The TM must know on which tool holder a tool has to be loaded.

The data is only evaluated if the value is greater than zero.

Then, the numbers \$TC_MPP5 are no longer regarded as spindle numbers but as tool holder numbers.

The automatic address extension of T and M=6 is then the value of this machine data, and no longer the value of MD20090 \$MC_SPIND_DEF_MASTER_SPIND.

The MD defines the master tool holder number to which a tool preparation or a tool change refers.

Reference is also made to this value for the determination of the tool on the tool holder for the setting 'retain old offset' of MD20110 \$MC_RESET_MODE_MASK.

If a machine has several tool holders but no defined master spindle, then the MD serves as a default value for determining the tool holder on which the tool is to be loaded during a tool change (reset, start, T='identifier', M6).

When defining the magazine locations of internal magazines (see documentation for TM), locations of the type 'SPINDLE' - \$TC_MPP1=2 = spindle location can be given a 'location kind index' (\$TC_MPP5). This assigns the location to a specific tool holder.

The tool holder with the number n can be declared the master tool holder with the language command SETMTH(n). That is, the offsets of a tool, which is loaded in a provisional buffer storage location of the type 'SPINDLE', correct the tool path with the value \$TC_MPP5=n.

Tool changes on 'SPINDLE' locations with \$TC_MPP5 unequal to the number of the master tool holder do not influence the path.

The tool holder defined in the MD is again declared as the master tool holder with SETMTH.

Description of Functions: Coordinate Systems (K2)

20125	CUTMOD_ERR			C08	-	
-	Error handling for function CUTMOD			UDWORD	Immediately	
-						
-	-	0, 0, 0, 0, 0, 0, 0, 0...	0	0x7FFFFFFF	7/7	U

Description:

When function CUTMOD becomes active (through explicit call or tool selection), various error conditions may occur. For any of these error conditions it is possible to use this machine data to set whether the error shall trigger an alarm and, if so, whether such an alarm shall only be displayed (warning) or whether the interpretation of the part program shall be canceled.

Two machine data bits are assigned to each error condition (also see the description of alarm 14162).

The 2nd bit, which can be used in the case of an error to set that the part program interpretation should be interrupted, is only effective, if the associated 1st bit (display) of an alarm is also set.

Bit Hex. Meaning

Value

0	0x1	Display error "Invalid cutting direction."
1	0x2	Program stop after error "Invalid cutting direction".
2	0x4	Display error "Undefined cutting edge angle".
3	0x8	Program stop after error "Undefined cutting edge angle".
4	0x10	Display error "Invalid clearance angle."
5	0x20	Program stop after error "Invalid clearance angle".
6	0x40	Display error "Invalid holder angle".
7	0x80	Program stop after error "Invalid holder angle".
8	0x100	Display error "Invalid insert angle."
9	0x200	Program stop after error "Invalid tool angle".
10	0x400	Program stop after error "Invalid insert angle".
11	0x800	Program stop after error "Invalid combination of cutting edge position and holder angle".
12	0x1000	Display error "Cutting edge plane deviates too significantly from machining plane".
13	0x2000	Program stop after error "Cutting edge plane deviates too significantly from machining plane".
14	0x4000	Error "Invalid angle ALPHA".
15	0x8000	Program stop after error "Invalid angle ALPHA".

20126	TOOL_CARRIER_RESET_VALUE			C03	W1	
-	Active tool holder on RESET			DWORD	Reset	
-						
-	-	0, 0, 0, 0, 0, 0, 0, 0...	0	-	7/7	M

Description: Definition of the tool holder for which tool length compensation is selected during runup or on reset or part program end as a function of MD20110 \$MC_RESET_MODE_MASK and as a function of MD20112 \$MC_START_MODE_MASK on part program start.

This data is valid without tool management.

20127	CUTMOD_INIT			C08	K1, W1	
-	Initialize CUTMOD after power ON			DWORD	PowerOn	
-						
-	-	0, 0, 0, 0, 0, 0, 0, 0...	-2	999999999	7/2	M

Description: The value programmable with NC command CUTMOD is initialized automatically on power ON with the value stored in this machine data. If the value of the machine data equals -2, CUTMOD will be set to the value included in MD20126 \$MC_TOOL_CARRIER_VALUE.

20128	COLLECT_TOOL_CHANGE			C04	-	
-	Tool change commands to PLC after search run			DWORD	PowerOn	
-						
-	-	1, 1, 1, 1, 1, 1, 1, 1...	-	-	1/1	M

Description: This MD is only relevant with active magazine management (MD18080 \$MN_MM_TOOL_MANAGEMENT_MASK, MD20310 \$MC_TOOL_MANAGEMENT_MASK). It defines whether or not tool change commands, tool preparation commands (tool change commands in general) are output to the PLC after block search with calculation.

2.3 NC machine data

1: Tool change commands, tool preparation commands are collected and, after reaching the search target, output to the PLC with program start.

0: All tool/magazine-specific commands that have been collected during the block search are not output to the PLC with the subsequent program start! This means that programmed POSM, TCI, TCA commands are not output either.

Note 1:

Without active magazine management, the tool change M code is not collected if it is not assigned to an auxiliary function group. With active magazine management, this corresponds to MD value = 0.

Note 2:

Value = 0 is appropriate if, for example, after reaching of the search target, the collected tool change commands are output to the PLC in an ASUB by means of the GETSELT, GETEXET commands.

MD22560 \$MC_TOOL_CHANGE_M_CODE

20130	CUTTING_EDGE_RESET_VALUE			C03	-	
-	Tool edge with length compens. during runup (reset/part program end)			DWORD	Reset	
-						
-	-	0, 0, 0, 0, 0, 0, 0, 0...	0	32000	7/2	M

Description:

Definition of the tool edge for which tool length compensation is selected during runup or on reset or part program end as a function of MD20110 \$MC_RESET_MODE_MASK, and as a function of MD20112 \$MC_START_MODE_MASK on part program start.

With active tool management and with bit 0 and bit 6 set in MD20110 \$MC_RESET_MODE_MASK at selection, the last offset of the tool active at power OFF - as a rule the tool on the spindle - is effective after runup.

Related to:

MD20110 \$MC_RESET_MODE_MASK

MD20112 \$MC_START_MODE_MASK

20132	SUMCORR_RESET_VALUE			C03	-	
-	Effective resulting offset on RESET			DWORD	Reset	
-						
-	-	0, 0, 0, 0, 0, 0, 0, 0...	0	6	7/2	M

Description:

Definition of the total offset with which the tool length compensation is selected in the runup and on reset or part program end as a function of MD20110 \$MC_RESET_MODE_MASK and as a function of MD20112 \$MC_START_MODE_MASK on part program start.

MD18110 \$MN_MM_MAX_SUMCORR_PER_CUTTEDGE determines the maximum useful value which can be entered.

20140	TRAFO_RESET_VALUE			C03	F2, TE4, M1	
-	Transformation data block during runup (reset/part program end)			BYTE	Reset	
-						
-	-	0, 0, 0, 0, 0, 0, 0, 0...	0	20	7/2	M

Description:

Definition of the transformation data block which is selected during runup and on reset or part program end as a function of MD20110 \$MC_RESET_MODE_MASK, and as a function of MD20112 \$MC_START_MODE_MASK on part program start.

Related to:

MD20110 \$MC_RESET_MODE_MASK

MD20112 \$MC_START_MODE_MASK

20142	TRAFO_RESET_NAME				C03	K1	
-	Transformation during runup (reset/part program end)				STRING	Reset	
-							
-	-	-	-	-	7/2	M	

Description: Specifies the name of a transformation (\$NT_NAME[n]) defined with the aid of kinematic chains, which is selected during power on or on reset/part program end as a function of MD 20110: \$MC_RESET_MODE_MASK and, on part program start, as a function of MD 20112: \$MC_START_MODE_MASK.

If this machine data is not empty, machine data MD20140 \$MC_TRAFO_RESET_VALUE is ignored. This means that MD20142 \$MC_TRAFO_RESET_NAME has priority over MD20140 \$MC_TRAFO_RESET_VALUE.

Not relevant:

MD20110 \$MC_RESET_MODE_MASK, bit 0 = 0

20144	TRAFO_MODE_MASK			C07	M1	
-	Function selection of kinematic transformation			UBYTE	Reset	
-						
-	-	0x0, 0x0, 0x0, 0x0, 0x0, 0x0, 0x0, 0x0...	0	0x03	7/2	M

Description: The specific functionality of the kinematic transformation is selected by setting the following bits:

Bit 0 = 0:

Default behavior.

Bit 0 = 1:

The transformation as defined in MD20140 \$MC_TRAFO_RESET_VALUE is persistent. That is, it is also selected with TRAFOOF and not shown in the display. This requires that the transformation defined in MD20140 \$MC_TRAFO_RESET_VALUE is selected automatically after RESET and START via MD20110 \$MC_RESET_MODE_MASK and MD20112 \$MC_START_MODE_MASK. This means that:

MD20110 \$MC_RESET_MODE_MASK bit 0 = 1 and bit 7 = 0,

MD20112 \$MC_START_MODE_MASK bit 7 = 1

MD20118 \$MC_GEOAX_CHANGE_RESET = TRUE

Bit 1 = 0:

Default behavior.

Bit 1 = 1:

The last active transformation is selected again after control power on. MD20110 \$MC_RESET_MODE_MASK Bit 0 = 1 and Bit 7 = 1 also have to be set.

20147	ZERO_CHAIN_ELEM_NAME				EXP, N01	K1	
-	Name of the kinematic chain element for defining the machine zero point				STRING	Reset	
-							
-	-	-	-	-	7/2	M	

Description: Specifies the name of a kinematic chain element that defines the machine zero point. This zero point is required, for example, to specify the position of a workpiece defined by the language command WORKPIECE, if its position is not specified relative to a kinematic chain in the language command itself.

2.3 NC machine data

20150	GCODE_RESET_VALUES			C11, C03	F2, TE4, K3, M1, M5, K1, K2, P1, V1	
-	Initial setting of G groups			BYTE	Reset	
-						
-	70	2, 0, 0, 1, 0, 1, 1, 1, 0, 1, 0, 1, 2, 1, 2, 1, 1, 1, 1, 1, 1, ...	0	-	7/2	M

Description:

Definition of the G codes, which are active when powering up and reset and/or end of part program depending on MD20152 \$MC_GCODE_RESET_MODE and for the start of part program depending on MD20112 \$MC_START_MODE_MASK.

The index of the G codes in the respective groups must be programmed as the default value.

For a list of the G groups and their G functions, please refer to References:

:	:	:
GCODE_RESET_VALUES[69]	70	1 (not defined)

20152	GCODE_RESET_MODE			C03	M1, K1, K2, P1	
-	Reset response of G groups			BYTE	Reset	
-						
-	70	0, 0,, ...	0	1	7/2	M

Description:

This MD is only evaluated if bit 0 is set in MD20110 \$MC_RESET_MODE_MASK.

For each entry in MD20150 \$MC_GCODE_RESET_VALUES (that is for each G group), this MD is used to determine whether, on reset/part program end, the setting in MD20150 \$MC_GCODE_RESET_VALUES is used again (MD = 0) or the current setting is retained (MD = 1).

Example 1:

Here, the basic setting for the 6th G group (current plane) is read from MD20150 \$MC_GCODE_RESET_VALUES at each reset / part program end:

MD20150 \$MC_GCODE_RESET_VALUES[5]=1 ; reset value of the 6th G group is G17

MD20152\$MC_GCODE_RESET_MODE[5]=0 ; after reset / part program end, the basic setting for 6th G group corresponds to MD20150 \$MC_GCODE_RESET_VALUES[5]

2.3 NC machine data

However, if the current setting for the 6th G group (current plane) is to be retained after reset / part program end, then the following setting results:

MD20150 \$MC_GCODE_RESET_VALUES[5]=1 ; reset value of the 6th G group is G17

MD20152 \$MC_GCODE_RESET_MODE[5]=1 ; current setting for the 6th G group

; is retained even after reset / part program end.

Example 2:

Here, the basic setting for the 8th G group (work offset) is read from MD20150

\$MC_GCODE_RESET_VALUES at each reset / part program end

MD20150 \$MC_GCODE_RESET_VALUES[7]=2 ; reset value of the 8th G group is G54

MD20152 \$MC_GCODE_RESET_MODE[7]=0 after reset / part program end, the basic setting for the 8th G group corresponds to MD20150 \$MC_GCODE_RESET_VALUES[7]

If G54 was already active, especially at the time of reset, the values of the corresponding data handling frame at the time of reset are activated.

However, if the current setting for the 8th G group (work offset) is to be retained after reset / part program end, then the following setting results:

MD20152 \$MC_GCODE_RESET_MODE[7]=1 ; if a work offset (e.g. G54) was active at the time of reset, then the values of the corresponding data handling frame at the time of reset are activated (that is UIFR[1] with G54)

The changing of the initial setting of individual G groups can be disabled for specific systems.

Related to:

MD20110 \$MC_RESET_MODE_MASK

MD20112 \$MC_START_MODE_MASK

20154	EXTERN_GCODE_RESET_VALUES			C11, C03	-	
-	Initial setting of G groups in ISO mode			BYTE	Reset	
-						
-	31	1, 1, 1, 2, 1, 1, 1, 3, 4, 1, 1, 2, 2, 1, 3, 2, 1, 0, 1, 1, 1,, ...	0	-	2/2	M

Description:

When an external NC programming language is used, the G codes which become active on runup and reset or at part program end are defined as a function of MD20110

\$MC_RESET_MODE_MASK and at part program start as a function of MD20112

\$MC_START_MODE_MASK.

The following external programming languages are possible:

ISO mode Milling

ISO mode Turning

The G group division that is to be used is stated in the current SINUMERIK documentation.

The following groups within MD20154 \$MC_EXTERN_GCODE_RESET_VALUES can be written:

ISO mode M:

G group 2: G17/G18/G19

G group 3: G90/G91

G group 5: G94/G95

G group 6: G20/G21

G group 13: G96/G97

G group 14: G54-G59

ISO mode T:

G group 2: G96/G97

G group 3: G90/G91

G group 5: G94/G95

G group 6: G20/G21

G group 16: G17/G18/G19

20156	EXTERN_GCODE_RESET_MODE			C03	-	
-	Reset response of external G groups			BYTE	Reset	
-						
-	31	0, 0,, ...	0	1	7/2	M

Description: This MD is evaluated only if bit0 is set in MD20110 \$MC_RESET_MODE_MASK (see there). For each entry in MD20154 \$MC_EXTERN_GCODE_RESET_VALUES (that is for each G group), this MD is used to determine whether, on reset/part program end, the setting in MD20154 \$MC_EXTERN_GCODE_RESET_VALUES is used again (MD = 0) or the current setting is retained (MD = 1).

Example for ISO mode M:

Here, the basic setting for the 14th G group (settable work offset) is read from MD20154 \$MC_EXTERN_GCODE_RESET_VALUES at each reset / part program end:

```
MD20154 $MC_EXTERN_GCODE_RESET_VALUES[13]=1 ; the reset value for the 14th G group
;is G54

MD20156 $MC_EXTERN_GCODE_RESET_MODE[13]=0 ; the basic setting for the 14th G group
;after reset / part program end is defined
by
;MD20154 $MC_EXTERN_GCODE_RESET_VALUES[13]
;

However, if the current setting for the 14th G group is to be retained beyond reset /
part program end, this results in the following setting:
MD20154 $MC_EXTERN_GCODE_RESET_VALUES[13]=1 ;reset value for the 14th G group
;is G54

MD20156 $MC_EXTERN_GCODE_RESET_MODE[13]=1 ;current setting for the 14th
;G group is retained even after
;reset / part program end
```

20160	CUBIC_SPLINE_BLOCKS			EXP, C09	-	
-	Number of blocks for C spline			BYTE	PowerOn	
-						
-	-	8, 8, 8, 8, 8, 8, 8, 8...	4	9	7/2	M

Description: Number of motion blocks across which a spline section is calculated with the cubic spline (CSPLINE) function.

The larger the value, the closer the generated contour is to the ideal mathematical cubic spline, which in the boundary condition CUBIC_SPLINE_BLOCKS = reaches infinity. However, the higher the value, the longer the block search calculation time.

MD33100 \$MA_COMPRESS_POS_TOL (maximum deviation with compression)

References:

/PA/, Programming Guide: Fundamentals

20171	SURF_BLOCK_PATH_LIMIT			C09	-	
mm	Maximum traverse length of an NC block for the COMPSURF function			DOUBLE	NEW CONF	
-						
-	-	0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0...	0.0	1.0E+301	7/2	M

Description:

The machine data defines the maximum traverse length of a block that is still regarded as compressible. Longer blocks interrupt the smoothing and are traversed normally.

If the value 0 is entered, then the maximum traverse length in the control is determined by the specified tolerance.

20172	COMPRESS_VELO_TOL			C09	B1, V1	
mm/min	Max. permissible deviation of path feedrate with compression			DOUBLE	PowerOn	
-						
-	-	60000.0, 60000.0, 60000.0, 60000.0, 60000.0, 60000.0, 60000.0, 6...	0.0	1.0E+301	7/2	M

Description:

The value indicates the maximum permissible deviation for the compression for the path feedrate. The larger the value, the more short blocks can be compressed into one long block. The maximum number of compressible blocks is limited by the size of the spline buffer.

In this way, the the compressors COMPON and COMPCURV may limit the compression of the path axes.

Compressor COMPCAD acts differently: It ignores changes to the F word as long as they lie below the threshold defined by COMPRESS_VELO_TOL. If the feed programmed in a block changes more than COMPRESS_VELO_TOL, COMPCAD interrupts the compression at this block transition so that the feed change takes place at exactly the desired position.

20196	TOCARR_ROTAX_MODE			C07	W1	
-	ToolCarrier: rotary axis setting with axis positions not defined			UDWORD	Immediately	
-						
-	-	2, 2, 2, 2, 2, 2, 2...	0	0x7	7/3	U

Description:

The MD is bit-coded. Bit 0 applies to orientable tool holders with one axis, bit 1 for those with 2 axes.

When the axis positions of an orientable tool holder are determined from a specified frame, it may happen that the required orientation is achieved at any position of a rotary axis.

This MD specifies how the rotary axis position is defined in these cases:

If the relevant bit is 0, the position of the rotary axis will be 0; a possibly necessary rotation is performed through the specified frame.

If the relevant bit is 1, the rotation is performed by means of the rotary axis of the orientable tool holder. The resulting frame will no longer include a rotation.

Example:

A tool in its basic position points into the Z direction, and an axis of the orientable tool holder rotates the workpiece around Z (C_Axis). If the tool is to be oriented parallel to the Z axis of a rotating frame, and if the frame only rotates around the Z axis, the tool orientation will not be changed if the C axis is rotated. The condition stating that the tool is to point in the direction of the Z axis defined by the frame is therefore fulfilled for any position of the Z axis.

Bit 2: If this bit is set, the value 1 is output in the system variable \$P_TCSOL as the number of solutions in a singular position for which there is one unique solution because of the alignment with the vertical coordinate axes perpendicular to the orientation. If this bit is not set, two solutions are output (the angles around the orientation axis differ by 180 degrees). This variant is required for compatibility with older software versions.

20200	CHFRND_MAXNUM_DUMMY_BLOCKS			EXP, C02, C06, C09	V1	
-	Empty blocks with chamfer/radii			BYTE	PowerOn	
-						
-	-	3, 3, 3, 3, 3, 3, 3...	0	15	7/2	M

Description:

Indicates the maximum number of blocks without traversing information in the compensation plane (dummy blocks) that can be programmed between two blocks with traversing information when chamfer/rounding are active.

20201	CHFRND_MODE_MASK			C09	V1	
-	Chamfer/rounding behavior			UDWORD	Reset	
-						
-	-	0x0, 0x0, 0x0, 0x0, 0x0, 0x0, 0x0, 0x0...	0	0xFFFF	7/2	M

Description: Determination of the chamfer/rounding behavior

Bit 0: (LSB) Assignment of the chamfer/rounding to the preceding or following block.

This influences:

- The technology of the chamfer/rounding (feed, type of feed, M commands ...)
- The execution of the blocks without movement in the active plane (e.g. M commands, movement in the applicate) before or after a modal rounding (RNDM)

Bit 1: free

Meaning of the individual bits:

Bit 0 = 0

Chamfer/rounding is derived from the following block (default value).

The technology of the chamfer/rounding is determined by the following block. Blocks without movement (M commands) or movement only in the applicate between two motion blocks in the plane are executed before the modal rounding.

Bit 0 = 1:

Chamfer/rounding is derived from the preceding block.

The technology of the chamfer/rounding is determined by the preceding block. Blocks without movement (M commands) or movement only in the applicate between two motion blocks in the plane are executed after the modal rounding.

20202	WAB_MAXNUM_DUMMY_BLOCKS			C02, C06	W1	
-	Maximum number of blocks w/o traversing movement with SAR			BYTE	Reset	
-						
-	-	5, 5, 5, 5, 5, 5, 5...	0	10	7/2	M

Description: Maximum number of blocks which can appear between the SAR (soft approach and retraction) block and the traversing block which determines the direction of the approach or retraction tangent.

20204	WAB_CLEARANCE_TOLERANCE			C06	W1	
mm	Change of direction with SAR			DOUBLE	PowerOn	
-						
-	-	0.01, 0.01, 0.01, 0.01, 0.01, 0.01, 0.01, 0.01...	0.0	1.0E+301	7/2	M

Description: In the case of smooth approach and retraction, the point defined with DISCL, from which, in the case of infeed from the initial plane, traversing is carried out at lower speed (G341) or the point in which the actual approach movement begins (G 340), must lie between the initial plane and the approach plane.

If this point lies outside this interval and the deviation is less than or equal to this machine data, it is assumed that the point lies in the approach or retraction plane.

If the deviation is greater, then alarm 10741 is output.

Example:

An approach is made from position Z = 20. The SAR plane is at Z = 0. The point defined by DISCL must therefore lie between these two values. If it lies between 20.000 and 20.010 or between 0 and -0.010, it is assumed that the value 20.0 or 0.0 was programmed (under the condition that the MD has the value 0.010). The alarm is output if the position is greater than 20.010 or less than -0.010.

2.3 NC machine data

20210	CUTCOM_CORNER_LIMIT			C08, C06	W1	
degrees	Maximum angle f. compensation blocks in tool radius compensation			DOUBLE	Reset	
-						
-	-	100., 100., 100., 100., 100., 100., 100., 100....	0.0	150.	7/2	M

Description: Where outer corners are very pointed, G451 can result in long idle paths. The system therefore switches automatically from G451 (intersection) to G450 (transition circle, with DISC where appropriate) when the outer corners are very pointed. The contour angle which can be traversed following this automatic switchover (intersection ---> transition circle) can be defined in CUTCOM_CORNER_LIMIT.

20212	CUTCOM_CUSP_LIMIT			C08, C06	W1	
degrees	Maximum angle for path overlap with tool radius compensation			DOUBLE	Reset	
-						
-	-	0.3, 0.3, 0.3, 0.3, 0.3, 0.3, 0.3, 0.3...	0.0	2.	7/2	M

Description: Owing to rounding errors (limited resolution of the positions in the NC program), very sharp outside corners (near 180 degrees) may lead to overlapping at the reversal point of the path. This means that block transitions that should actually be outside corners are regarded mathematically as inside corners.

This machine data can be used to set the deviation from 180 degrees at which an inside corner is to be treated as an outside corner.

20220	CUTCOM_MAX_DISC			C08, C06	W1	
-	Maximum value for DISC			DOUBLE	Reset	
-						
-	-	50.0, 50.0, 50.0, 50.0, 50.0, 50.0, 50.0, 50.0...	0.0	75.0	7/2	M

Description: The G450 transition circle cannot produce sharp outer contour corners, because the path of the tool center point through the transition circle is controlled so that the cutting edge stops at the outer corner (programmed position).

Where sharp outer corners are to be machined with G450, the DISC instruction can be used in the program to program an overshoot. This transforms the transition circle into a conic section and the cutting edge lifts off from the outer corner.

The value range of the DISC instruction extends from 0 to theoretically 100 in steps of 1.

DISC = 0 ...Overshoot disabled, transition circle active

DISC = 100 ...Overshoot large enough to theoretically produce a response similar to intersection (G451).

Programmed values of DISC which are higher than those stored in CUTCOM_MAX_DISC are limited to this maximum value without output of a message. A severely non-linear alteration in the path velocity can thus be avoided.

Special cases:

It is not generally meaningful to enter values higher than 50 in DISC.

It is therefore not possible to enter values > 75.

20230	CUTCOM_CURVE_INSERT_LIMIT			C08, C06	W1	
-	Maximum angle for calculation of intersection with TRC			DOUBLE	Reset	
-						
-	-	10., 10., 10., 10., 10., 10., 10., 10....	0.0	150.	7/2	M

Description: Where outer corners are very flat, G450 (transition circle) and G451 (intersection) approximate each other more and more. In such a case, it is no longer useful to insert a transition circle. Especially with 5-axis machining, it is not allowed to insert a transition circle at these outer corners, as this might lead to losses in velocity during continuous-path mode (G64).

That is why the system switches automatically from G450 (transition circle, possibly with DISC) to G451 (intersection) in the case of very flat outer corners. The contour angle (in degrees), as of which the automatic switchover (transition circle ---> intersection) is to be carried out, can be specified in CUTCOM_CURVE_INSERT_LIMIT.

20240	CUTCOM_MAXNUM_CHECK_BLOCKS	C08, C02	W1
-	Blocks for look-ahead contour calculation with TRC	DWORD	PowerOn
-			
-	-	4, 4, 4, 4, 4, 4, 4, 4...	2 10000 7/2 M

Description: Indicates the maximum number of blocks with traversing information at the offset plane that are considered simultaneously for collision detection with active radius compensation.

20250	CUTCOM_MAXNUM_DUMMY_BLOCKS	C08, C02	W1
-	Maximum number of blocks without traversing motion in TRC	DWORD	PowerOn
-			
-	-	3, 3, 3, 3, 3, 3, 3, 3...	0 1000 7/2 M

Description: During active TRC only program blocks with movements of geometry axes perpendicular to the current tool orientation are normally programmed. Nevertheless, individual intermediate blocks that do not contain such path information may also be programmed during active TRC. For example:

- Movements in the direction of tool orientation
- Movements in axes that are not geometry axes
- Auxiliary functions
- In general: Blocks that are taken over into the main run and executed there

The maximum number of intermediate blocks is defined with this MD. If the value is exceeded, alarm 10762 "Too many empty blocks between 2 traversing blocks during active tool radius compensation" is output.

Note:

Comment blocks, arithmetic blocks and empty blocks are not intermediate blocks in the sense of this MD and can therefore be programmed in any number (without an alarm being triggered).

20252	CUTCOM_MAXNUM_SUPPR_BLOCKS	EXP, C01, C08, C02	W1
-	Maximum number of blocks with compensation suppression	DWORD	PowerOn
-			
-	-	5, 5, 5, 5, 5, 5, 5, 5...	0 1000 7/2 M

Description: Indicates the maximum number of blocks for active tool radius compensation, in which the function "Keep radius offset constant" (CUTCONON or reprogramming of G41 / G42 during active TRC) may be active.

Note:

The restriction of the number of blocks with active CUTONON is necessary in order to carry out repositioning in this situation too. Increasing this value for the machine data can lead to an increased memory requirement for NC blocks.

2.3 NC machine data

20254	ONLINE_CUTCOM_ENABLE			EXP, C01, C08	-	
-	Real-time tool radius compensation enabled			BOOLEAN	PowerOn	
-						
-	-	FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE...	0	-	7/2	M

Description: This data enables online tool radius compensation. When the function is enabled, the control reserves the necessary memory space required for online tool radius compensation after POWER ON.

ONLINE_CUTCOM_ENABLE = 0:

Online tool radius compensation can be used

ONLINE_CUTCOM_ENABLE = 1:

Online tool radius compensation cannot be used

20256	CUTCOM_INTERS_POLY_ENABLE			C09	W1	
-	Intersection procedure for polynomials is possible			BOOLEAN	PowerOn	
-						
-	-	TRUE, TRUE, TRUE, TRUE, TRUE, TRUE, TRUE, TRUE...	0	-	7/2	M

Description: If this machine data is TRUE and tool radius compensation active, the transitions at outer corners where polynomials (splines) are involved can be treated with the intersection mode. If the machine data is FALSE, conic sections (circles) are always inserted in this case.

If the machine data is FALSE, the response is identical to that of software releases older than 4.0.

20262	SPLINE_FEED_PRECISION			EXP, C09, C05	-	
-	Permissible rel. error of path velocity for spline			DOUBLE	PowerOn	
-						
-	-	0.001, 0.001, 0.001, 0.001, 0.001, 0.001, 0.001, 0.001...	0.000001	1.0	7/2	M

Description: This machine data is evaluated only if MD28540 \$MC_MM_ARCLENGTH_SEGMENTS is greater than 0.

The factor indicates how large the relative error of the path velocity may be for splines, compressor and polynomial interpolation. The smaller the factor the more computing time is required for preprocessing.

Furthermore, more memory is required to display the arc length function (see 28540 \$MC_MM_ARCLENGTH_SEGMENTS).

Example:

SPLINE_FEED_PRECISION=0.1, programmed path velocity=1000 mm/min.

The actual path velocity for polynomial and spline interpolations may then vary within the range between 900 and 1100 mm/min.

20270	CUTTING_EDGE_DEFAULT			C11, C03	H2, W1	
-	Initial position of tool cutting edge without programming			DWORD	PowerOn	
-						
-	-	1, 1, 1, 1, 1, 1, 1...	-2	32000	7/2	M

Description: Default cutting edge after tool change

If no cutting edge has been programmed after a tool change, the default cutting edge number set in MD20270 \$MC_CUTTING_EDGE_DEFAULT is used.

Value

:= 0

Initially, no cutting edge is active after a tool change.

The cutting edge is not selected until D programming.

:= 1

MD_SLMAXCUTTINGEDGENUMBER

No. of cutting edge (MD_SLMAXCUTTINGEDGENUMBER=9 is valid up to P4)

:= -1

Cutting edge number of old tool also applies to new tool.

:= -2

Cutting edge (correction) of old tool remains active until D is programmed. This means that the old tool remains the active tool until D is programmed. In other words, the tool on the spindle remains the programmed tool until D is programmed.

Example:

MD20270 \$MC_CUTTING_EDGE_DEFAULT = 1;

After a tool change, the first cutting edge is active if no other cutting edge has been programmed.

20272	SUMCORR_DEFAULT			C03	H2, W1	
-	Initial position resulting offset without program			DWORD	PowerOn	
-						
-	-	0, 0, 0, 0, 0, 0, 0, 0...	-1	6	7/2	M

Description: The number of the total offset of the cutting edge which becomes active when a new cutting edge compensation is activated without a programmed DL value being available.

MD18110 \$MN_MM_MAX_SUMCORR_PER_CUTTEDGE

defines the maximum useful value which can be entered.

Value Meaning

> 0 Number of the total offset

= 0 No total offset active with D programming

= 1 The total offset number for the previously programmed D is used.

Related to:

MD20270 \$MC_CUTTING_EDGE_DEFAULT.

20274	MULTITOOLLOC_DEFAULT			N09	-	
-	Number of the multitool location, whose tool is selected for T= location.			DWORD	Immediately	
-						
-	-	0, 0, 0, 0, 0, 0, 0, 0...	0	72	7/3	U

Description: Only of significance when the 'Multitool' function is active plus 'T= location' programming: Multitool location number of the location in the multitool, whose tool is selected for a tool change programmed with 'T= location'. If the tool is not ready for use, with the appropriate configuration, an attempt is made to select a replacement tool.

If the tool at the magazine location programmed with 'T= location' is not a multitool, then MD20274 has no effect.

The value zero signifies that when programming 'T= location' the multitool location number is used, which corresponds to the multitool position.

Entering the MD can be suppressed by explicitly programming the multitool location number with the MTL command.

2.3 NC machine data

The value entered in MD20274 must correspond at the time of programming to the location of the multitool, located in the magazine location, which was programmed with 'T= location'.

Example:

```
MD20274 $MC_MULTITOOLOC_DEFAULT = 2;
```

T=5 ; 5 is a magazine location with a multitool. Select the tool that is located at location 2 of this multitool.

T=5 MTL=1 ; 5 is a magazine location with a multitool. Select the tool that is located at location 1 of this multitool. Programming MTL suppresses the setting of this MD

20280	LIMIT_CHECK_MODE			EXP	-	
-	Type of limit position check			DWORD	Reset	
-						
-	-	1, 1, 1, 1, 1, 1, 1...	0	1	1/1	M

Description: This MD can be used to set the mode of operation for the software limit position check.
The following options are available:
0: The limit positions are checked in real time on active transformation
1: The limit positions are checked in a preparative manner on active transformation

20310	TOOL_MANAGEMENT_MASK			C09	P3 pl, P3 sl	
-	Activation of tool management functions			UDWORD	PowerOn	
-						
-	-	0x2, 0x2, 0x2, 0x2, 0x2, 0x2, 0x2, 0x2...	0	0xFFFFFFFF	7/2	M

Description: MD = 0: Tool management inactive
Bit 0 to bit4
Bit 0=1: Tool management active
Tool management functions are enabled for the current channel.
Bit 1=1: Tool monitoring function active
The functions for monitoring the tools (tool life and quantity) are enabled.
Bit 2=1: OEM functions active
The memory for user data can be used (see also MD18090 \$MN_MM_NUM_CC_MAGAZINE_PARAM to MD18098 \$MN_MM_NUM_CC_MON_PARAM)
Bit 3=1: Consider adjacent location active
Bit 0 to bit 3 must be set as in MD18080 \$MN_MM_TOOL_MANAGEMENT_MASK.
Bit 4=1: The PLC has the option of requesting a T preparation again with changed parameters.
The acknowledgment states "2", "7" und "103" are enabled with this bit. The tool selection is then recalculated in the NCK.
Note: Bit4=1 (PLC can reject tool) and Bit23=1 (interpreter selects tool) are mutually exclusive.
Bit 5 to bit 8
Bit 5 and bit 7 refer to the main spindle
Bit 6 und bit 8 refer to secondary spindles
Bit 5 = 1: The command is regarded as output when the internal transport acknowledgment + the transport acknowledgment are present, that is, when the command has been accepted by the basic PLC program.
(Bit 19=1 also allows the block change to be prevented (main run) until the required acknowledgments have been received.)
Bit 7 = 1: The output of the command is not regarded as being completed until the end acknowledgment has been received from the PLC. That is, the command has been acknowledged by the PLC user program with status "1".

(Bit 19=1 also allows the block change to be prevented (main run) until the required acknowledgments have been received.)

Bit 5 and bit 7 (alternatively bit 6 and bit 8) are mutually exclusive.

Only the following combinations are permissible:

Bit 5: ...0...1...0

Bit 7: ...0...0...1

With the default setting, that is bits 5 to 8 = 0, synchronization takes place in the block in which a cutting edge is selected for the first time.

Setting these bits delays the block processing.

Bit 9 to bit 11

Bit 9: Reserved for test purposes

It can also be used by machine manufacturers during the test phase, provided that the PLC program does not yet control the tool change.

Bit 10=1: M06 is delayed until the preparation has been accepted by the PLC user program.

The change command is not output until the preparation acknowledgment has been received. That can be, for example, status "1" or "105".

Bit 10=0: The change command is output without delay, directly after the preparation command.

Bit 11=1: The tool preparation command (PLC command numbers=2, 4, 5) is also executed if the same tool preparation command has already been executed. (Commands 4, 5 contain the tool preparation)

Example: (Tool changed with M6 (PLC command no.= 3):

T="Tool1"; tool preparation

M6; tool change

T="Tool2" ; 1st tool preparation after M6 (for same tool holder)

; is always output to PLC.

T="Tool2"; 2nd tool preparation is only output as a command to the PLC if bit 11 = 1.

; This tool preparation counts as the first if the state of the tool has changed since the previous tool preparation such that it would no longer be serviceable.

That might be, for example, an asynchronous unloading of the tool. This tool preparation then attempts to select a replacement tool.

Bit 11=0: The preparation command can only be output once for any one tool.

Bit 12 to bit 14

Bit 12=1: The preparation command (PLC command numbers = 2, 4, 5) is also executed when the tool is already in the spindle/tool holder.

T="Tool1" ; tool preparation

M6; tool change

T="Tool1"; tool is already in the tool holder

; 1st tool preparation after M6 (for the same tool holder)

; is only output to the PLC if bit 12 = 1.

; An unserviceable tool (e.g. disabled because of tool monitoring.) on the tool holder does not count as being on the tool holder. This tool preparation then attempts to select a replacement tool.

T="Tool2" ; 2nd tool preparation - the rules of bit 11 apply to the output.

Bit 12=0: The preparation command is not executed if the tool is already in the spindle.

Bit 13=1: On reset, the commands are retrieved from the diagnostics buffer and stored in the passive file system (TCTRAxx.MPF under part program) This file is required by the Hotline.

The tool sequences are only recorded in the diagnostics buffers of systems that have adequate memory (NCU572, NCU573)).

Bit 14=1: Reset mode

2.3 NC machine data

Tool and offset selection correspond to the settings in MD20110 \$MC_RESET_MODE_MASK and MD20112 \$MC_START_MODE_MASK.

Bit 14=0: No reset mode

Bit 15 to bit 19

Bit 15=1: No return transport of the tool if there are multiple preparation commands (Tx->Tx).

Bit 15=0: Return transport of the tool from any defined buffers.

Bit 16=1: T = location number is active

Bit 16=0: T="Tool name"

Bit 17=1: Tool life decrementation can be started and stopped via the PLC in channel DB 2.1...DBx 1.3.

Bit 18=1: Activation of monitoring of "Last tool in the tool group"

Bit 18 Lengthens the search for a suitable tool, above all, when there are a large number of disabled replacement tools.

Bit 18=0: No monitoring of "Last tool in the tool group"

Bit 19=1: The synchronizations determined by bits 5...8 refer to the main run block. This means that the block change is delayed until the required acknowledgments have been received.

Bit 19, in conjunction with set bits 5, 6, 7, 8, delays block processing.

Bit 19=0: The synchronizations determined by bits 5...8 refer to the tool command output. This means that the block change is not delayed.

Bit 20 to bit 24

Bit 20=0: If the PLC signal "Program test active" is present, then the commands generated are not output to the PLC. The NCK acknowledges the commands itself. The magazine and tool data are not changed.

Bit 20=1: If the PLC signal "Program test active" is present, then the commands generated are output to the PLC. Depending upon the type of acknowledgment, tool/magazine data can be changed in the NCK. If the acknowledgment parameters for the "target magazine" are given the values of the "source magazine", then there is no tool transport, and thus also no data change in the NCK.

Bit 21=0: Default setting: Ignore the tool state "W" during tool selection.

Bit 21=1: Tools in the state "W" cannot be selected by another tool change/tool preparation command.

Bit 22=1: Function "Tool subgroups"

\$TC_TP11[x] is the grouping or selection parameter

Bit 23=0: Default setting

The tool management selects the tool optimally and safely in the main run. This means that the interpreter may have to wait until the end of the tool selection for the offset selection.

Bit 23=1: For simple applications

The interpreter selects the tool itself. This means synchronization with the main run is not required for the offset selection. (However, an uncorrectable alarm may be issued if a tool becomes unserviceable after selection but before loading.)

Note: Bit4=1 (PLC can reject tool) and Bit23=1 (interpreter selects tool) are mutually exclusive.

Bit 24=0: Default setting

If the PLC commands 8 and 9 (asynchronous transfer) want to move a tool to a location reserved for another tool, then this is rejected with an alarm.

Bit 24=1: If the PLC commands 8 and 9 want to move a tool to a location reserved for another tool with "Reserved for tool from buffer" (bit value= "H4"), then this is possible. This location reservation is removed before execution of the motion ("Reserved for new tool to be loaded" (bit value= "H8") remains effective).

-			
-	-	0x0, 0x0, 0x0, 0x0, 0x0, 0x0, 0x0, 0x0...	0 0x7FFFFFFF 7/2 M

Description: Definition of the effects of tool parameters.
Bit no. meaning when bit is set

Bit 0: (LSB):
For turning and grinding tools, the wear parameter of the transverse axis is included in the calculation as a diameter value.
Bit 1:
For turning and grinding tools, the tool length component of the transverse axis is included in the calculation as a diameter value.
Bit 2:
If a tool length correction is included in the calculation as a diameter value, the tool may only be used in the plane that was active when the tool was selected. If this bit is set, a plane change leads to an alarm.
Bit 3:
Work offsets in frames in the transverse axis are included in the calculation as diameter values.
Bit 4:
PRESET value is included in the calculation as a diameter value
Bit 5:

2.3 NC machine data

Include the external work offset in the transverse axis in the calculation as a diameter value

Bit 6:

Read actual values of the transverse axis as diameter values (AA_IW, AA_IEN, AA_IBN, AA_IB. Notice: Not AA_IM.)

Bit 7:

Display all actual values of the transverse axis as diameter values, irrespective of the G code of group 29 (DIAMON / DIAMOF)

Bit 8:

Always display the distance-to-go as a radius in the Work (WCS)

Bit 9:

During DRF handwheel travel of a transverse axis, only half the distance of the specified increment is traveled (on condition that MD11346 \$MN_HANDWH_TRUE_DISTANCE = 1).

Bit10:

Activate the tool component of an active, orientable tool holder even if no tool is active.

Bit11:

The tool parameter \$TC_DP6 is not interpreted as a tool radius but as a tool diameter.

Bit12:

The tool parameter \$TC_DP15 is not interpreted as wear of the tool radius but as wear of the tool diameter.

Bit13:

During JOG of circles, the circle center coordinate is always a radius value, see D42690 \$SC_JOG_CIRCLE_CENTRE.

Bit14:

Absolute values of the transverse axis with cycle screenforms in the radius

Bit15:

Incremental values of the transverse axis with cycle screenforms as diameter

Bit16:

For GWPS (GWPSON/TMON), the tool parameters, tool length, wear and base dimension, are interpreted as diameter values

Bit17:

With cutting edge position compensation (CUTMOD) for turning and grinding tools, the cutting plane for calculating the compensation values is rotated into the machining plane. If this bit is not set, the cutting edge is projected into the machining plane instead.

Bit18:

With cutting edge position compensation (CUTMOD) for turning and grinding tools, always use the active plane (G17 - G19). If this bit is not set, the plane specified by setting data SD42940 \$SC_TOOL_LENGTH_CONST has priority over the plane specified by the G code group 6 (plane selection, G17 - G19).

Bit19:

The tool orientation change caused by an orientable tool holder becomes effective even if no tool is active. This bit is only effective if bit 10 is also set.

Bit20:

If this bit is zero, and if the tool parameter \$TC_DP10 (holder angle) and/or \$TC_DP24 (clearance angle) contain the value 0, the following default values are used as the basis for the function CUTMOD to calculate the modified cutting-edge position and the modified cutting-edge direction:

Holder angle 112.5 degrees for cutting-edge positions 1 - 4

Holder angle 67.5 degrees for cutting-edge positions 5 - 8

Clearance angle 22.5 degrees for cutting edge positions 1 - 4

Clearance angle 67.5 degrees for cutting-edge positions 5 - 8

If this bit is set, an alarm is output in the cases mentioned. This bit is used to establish compatibility with older software releases.

Bit21:

If this bit is zero, any existing rotation in the part proportion of the tool carrier is taken into account for CUTMOD with tool carrier when modifying the cutting edge position. Frames are ignored.

If this bit is 1, in the place of the part proportion of the tool carrier, the active total frame is taken into account with CUTMOD with tool carrier with modification of the cutting edge position. The total frame can also contain a part proportion of the tool carrier.

Bit22:

If this bit is zero, with an active kinematic transformation, a wear component of the tool that cannot be transformed (see SD42935 \$SC_WEAR_TRANSFORM) is taken into account statically with the position of the transformation that was valid at the time of the tool selection.

If this bit is 1, with an active kinematic transformation, a wear component of the tool that cannot be transformed (see SD42935 \$SC_WEAR_TRANSFORM) is taken into account in real-time with the relevant current position of the transformation.

20370	SHAPED_TOOL_TYPE_NO			C01, C08	-	
-	Tool type number for contour tools			DWORD	Immediately	
-						
-	4	0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0...	-	-	7/2	M

Description:

Indicates for each channel max. two number ranges for tool types that are treated as forming tools. Therefore individual ranges are possible both for grinding and for turning tools.

The first range is specified by the first and the second number, the second range by the third and fourth number.

If the first number is not smaller than the second one (the same applies for the third and fourth number), no range will be defined, but two individual numbers will be specified instead.

The numbers 400 through 599 are permissible (tool type numbers for turning and grinding tools), and also value 0 (no tool type number defined).

Examples:

400 405 590 596 : Tool types 400-405 and 590-596 are contour tools

410 400 590 596 : tool types 400, 410 and 590-596 are contour tools

450 0 420 430 : Tool types 450 and 420-430 are contour tools

20372	SHAPED_TOOL_CHECKSUM			C01, C08	-	
-	Checksum test for contour tools			BOOLEAN	Immediately	
-						
-	-	FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE...	0	-	7/5	U

Description:

Indicates for each channel whether for completion of the contour tool definition an edge must be available that includes the negative sums of tool length components and tool radius of the previous edges.

2.3 NC machine data

20380	TOOL_CORR_MODE_G43G44			C01, C08, C11	-	
-	Treatment of tool length compensation with G43 / G44			BYTE	Reset	
-						
-	-	0, 0, 0, 0, 0, 0, 0, 0...	0	2	7/2	M

Description:

This machine data determines in ISO mode M (G43 / G44) the way in which length compensations programmed with H are processed.

0: Mode A

Tool length H always acts on the third geometry axis (usually Z)

1: Mode B

Tool length H acts, depending on the active plane, on one of the three geometry axes. This means with

G17 on the 3rd geometry axis (usually Z)

G18 on the 2nd geometry axis (usually Y)

G19 on the 1st geometry axis (usually X)

In this mode, compensations in all three geometry axes can be configured through multiple programming, i.e. through the activation of one component, the length compensation possibly active in another axis is not deleted.

2: Mode C

The tool length acts, independent of the active plane, on the axis that has simultaneously been programmed with H. Otherwise, the response is the same as with mode B.

20382	TOOL_CORR_MOVE_MODE			C01, C08	-	
-	Traversing of tool length compensation			BOOLEAN	Reset	
-						
-	-	FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE...	0	-	7/2	M

Description:

This machine data determines how the tool length compensations are traversed.

0: A tool length compensation is only traversed if the associated axis has been programmed (behavior as in previous software versions)

1: Tool lengths are always traversed independently of whether the associated axes are programmed or not.

20384	TOOL_CORR_MULTIPLE_AXES			C01, C08, C11	-	
-	Tool length compensation in several axes simultaneously			BOOLEAN	Reset	
-						
-	-	TRUE, TRUE, TRUE, TRUE, TRUE, TRUE, TRUE, TRUE...	0	-	7/2	M

Description:

This machine data determines for tool length compensation in ISO mode M (ISO2) (G43 / G44), whether the compensation shall be allowed in mode C (selection of the axis on which the compensation is acting by specifying the corresponding axis letter) to act on several axes simultaneously.

If this machine data is 1, this type of programming is allowed; otherwise it is rejected with an alarm.

20390	TOOL_TEMP_COMP_ON			C01, C08	K3, W1	
-	Activation of temperature compensation for tool length			BOOLEAN	Reset	
-						
-	-	FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE...	0	-	7/2	M

Description: This machine data activates the temperature compensation in tool direction (see also SD42960 \$SC_TOOL_TEMP_COMP)

20392	TOOL_TEMP_COMP_LIMIT			C01, C08	W1	
mm	Max. temperature compensation for tool length			DOUBLE	Reset	
-						
-	3	1.0, 1.0 , 1.0, 1.0, 1.0 , 1.0, 1.0, 1.0 , 1.0, 1.0, 1.0 , 1.0, ...	0.0	1.0E+301	7/7	U

Description: With temperature compensation, this machine data indicates the maximum permissible value for the tool length for each geometry axis.
If a temperature compensation value larger than this limit value is entered, it will be limited without an alarm.

20396	TOOL_OFFSET_DRF_ON			C01, C08	-	
-	Handwheel override in tool direction			BOOLEAN	Reset	
-						
-	-	FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE...	0	-	7/2	M

Description: This machine data activates the handwheel override in tool direction.
When this machine data is set, a handwheel override is active in the axis that is assigned to length L1 of the active tool, in the direction defined by tool orientation.
Example:
G17 is active; the tool is a milling tool; tool length L1 is therefore assigned to the Z axis (the 3rd geometry axis).
When the tool (e.g. with active 5-axis transformation) is turned around the Y axis by 90 degrees, so that it shows in X direction, a handwheel override becomes active in the 3rd axis in the X axis.

20400	LOOKAH_USE_VELO_NEXT_BLOCK			EXP, C05	B1	
-	LookAhead following block velocity			BOOLEAN	PowerOn	
-						
-	-	TRUE, TRUE, TRUE, TRUE, TRUE, TRUE, TRUE. TRUE...	0	-	7/2	M

Description: For SW-internal function optimization.

20430	LOOKAH_NUM_OVR_POINTS			EXP, C02, C05	B1	
-	Number of override characteristics for LookAhead			DWORD	PowerOn	
-						
-	-	1, 1, 1, 1, 1, 1, 1...	0	2	7/2	M

Description: For SW-internal function optimization.

Description:	For SW-internal function optimization.
---------------------	--

Description:	The MD specifies for which technology groups the extended LookAhead is active. Value 0: Default LookAhead Value 1: Extended LookAhead Value 2: reserved E.g. MD20443 \$MC_LOOKAH_FFORM[4]=1; i.e. activation for DYNFINISH. Entry for all dynamic G code groups. When changing between default LookAhead and extended LookAhead or vice versa, the continuous-path mode is interrupted by an interpolatory stop.
---------------------	---

Description:	Block change problems occur for the following reason: The traversing length of the NC blocks to be processed is so short that the Look Ahead function has to reduce the machine velocity to provide enough time for block preparation. In this situation, constant decelerations and accelerations of the path motion can occur. This machine data defines the extent to which such velocity fluctuations are to be smoothed. Special cases: Values up to approx. 1.0 are appropriate. The value 0.0 means that the function is deactivated.
---------------------	--

Description:	Look Ahead special functions: Bit 0 = 1: The Safety Integrated setpoint limitation is already taken into account in Look Ahead. It is used to calculate a block-wide limitation of the path velocity which acts in addition to the other limitations (e.g. override). Bit 1 = 1:
---------------------	--

The function of bit 0 is extended so that, from the Safety Integrated setpoint limitation, various limits of the path velocity are calculated for various areas of the block. In comparison to the functionality of bit 0, this enables the axis velocity to run nearer (but still below) the Safety Integrated setpoint limitation.

Bit 2 = 1:

Reserved

20463	FIFOCTRL_ADAPTION	EXP, C05	-
-	Adaptation of the IPO buffer control	DOUBLE	NEW CONF
-			
-	-	0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0...	0.0 1.0 1/1 M

Description: The MD defines how significantly the IPO buffer control (FIFOCTRL) should influence the path feedrate with the buffer full.

0.0 means that the IPO buffer control, for a full IPO buffer stops limiting the path feedrate. This shortens the machining time, but it can increase the risk of the IPO buffer running empty.

1.0 means that the IPO buffer control, with full IPO buffer continues to control the path feedrate, and therefore avoids the IPO buffer becoming empty faster. This results in minor fluctuations of the IPO buffer fill level. However, a longer machining time must be expected.

Values between 0.0 and 1.0 permit a smooth, seamless transition from the old to the new response.

Corresponds with:

FIFOCTRL

20464	PATH_MODE_MASK	EXP, C05	-
-	Path behavior	UDWORD	Reset
-			
-	-	0, 0, 0, 0, 0, 0, 0, 0, 0...	0 0xffff 7/2 M

Description: This machine data is used to influence the path action

Bit0:

If only rotary axes are traversed in the block as path axes with active G700, the programmed rotary axis velocity corresponds to

0: [degrees/min]

1: [25.4*degrees/min]

20470	CPREC_WITH_FFW	EXP, C06, C05	K6
-	Programmable contour accuracy	BYTE	NEW CONF
-			
-	-	0, 0, 0, 0, 0, 0, 0, 0, 0...	0 5 7/2 M

Description: This machine data defines the behaviour of the programmable function CPRECON.

0: The CPRECON function is inactive when feedforward control is activated simultaneously.

1: CPRECON is also active with feedforward control.

2: As 1, but the function is parameterised with MD32415 \$MA_EQUIV_CPREC_TIME.

3: As 2, but any contour accuracy programmed with CTOL has priority over SD42450 \$SC_CONTPREC.

2.3 NC machine data

4: CPRECON is active independently of the feedforward control and jerk filter. Only MD32415 \$MA_EQUIV_CPREC_TIME is taken into account in the calculation of the contour error. All time constants that have effects on the contour error must be summated and entered MD32415 \$MA_EQUIV_CPREC_TIME.

5: As 4, but a contour accuracy that may have been programmed with CTOL has priority over SD42450 \$SC_CONTPREC.

The values 0 and 1 are no longer recommended. They only provide compatibility with older software versions.

Related to:

SD42450 \$SC_CONTPREC

SD42460 \$SC_MINFEED

MD32415 \$MA_EQUIV_CPREC_TIME

20476	ORISON_STEP_LENGTH			EXP	F2	
mm	Path length for block division with ORISON			DOUBLE	NEW CONF	
-						
-	-	0.5, 0.5, 0.5, 0.5, 0.5, 0.5, 0.5, 0.5...	0.001	1.0E+301	1/1	M

Description:

The path lengths of the part blocks are set with this MD as they are formed with orientation smoothing with ORISON.

For this data to be active, the division of blocks with ORISON must be enabled with MD20478 \$MC_ORISON_MODE

(Value 100).

If a length is set for this MD that is significantly shorter than the default length of 0.5 mm, problems may occur with the performance and effectiveness of the orientation smoothing with large tolerances. If this length is reduced, the block buffer for the orientation smoothing (MD28590 \$MC_MM_ORISON_BLOCKS) usually also has to be increased, so that the orientation smoothing can still act over an adequately long path length.

20478	ORISON_MODE			EXP	F2	
-	Mode of orientation smoothing			DWORD	NEW CONF	
-						
-	-	100, 100, 100, 100, 100, 100, 100, 100...	0	3232	7/7	U

Description:

The mode of operation of orientation smoothing with ORISON can be set with this MD.

The units, tens, hundreds and thousands digits have different meanings.

The following possibilities are available:

The units digits of this data define the type of smoothing: rotary axis or vector smoothing.

xx0: The type of smoothing is defined by the active G code of the 51st G code group:

ORIAXES active: rotary axis smoothing, ORIAXES inactive (e.g. ORIVECT): vector smoothing.

xx1: Vector smoothing irrespective of the active G code of the 51st G code group

xx2: Rotary axis smoothing irrespective of the active G code of the 51st G code group

The tens digits can change the effect of the smoothing:

x0x: Smoothing takes place along the entire path length.

x1x: Smoothing takes place homogeneously along the traversing length of the orientation axes.

x2x: Tolerance changes become active block-synchronously. In the other case, a change of tolerance becomes active incrementally over a defined path length. As a rule, this leads to a more homogeneous progression of the orientation. This setting option only plays a role if the blocks are subdivided (hundreds digit of this machine data 1xx). If the blocks are not subdivided, any tolerance change always becomes active block-synchronously.

The hundreds digits can be used to set whether the smoothing works on the programmed original blocks or on suitably split blocks:

0xx: The programmed blocks are not subdivided. The effect of the orientation smoothing is very dependent on the programmed block structure.

1xx: The programmed blocks are subdivided so that the orientation smoothing can generate a homogeneous progression of the orientation.

Only those blocks are subdivided, in which a compressor (COMPCAD, COMPCURV, COMPON) is active.

2xx: The programmed blocks are subdivided so that the orientation smoothing can generate a homogeneous progression of the orientation.

All program blocks are subdivided, irrespective of whether a compressor (COMPCAD, COMPCURV, COMPON) is active in it or not.

The thousands digit can be used to set how the tolerance is specified for the orientation smoothing:

0xxx: The tolerance is specified according to the usual rules. This means that when OTOL = <...> is programmed, the value thus programmed becomes active, otherwise the value of SD \$SC_ORISON_TOL becomes active. The G0 tolerance factor is always

calculated in (value of MD20560 \$MC_G0_TOLERANCE_FACTOR or the value programmed with STOLF = <...>).

1xxx: The tolerance is always specified with SD42678 \$SC_ORISON_TOL, irrespective of whether OTOL = <...> was programmed.

2xxx: The G0 tolerance factor is not included in the calculation. This is the case both for the tolerance specified with OTOL = <...> as well as with SD42678 \$SC_ORISON_TOL.

The two numerical values can be combined with one another.

20480	SMOOTHING_MODE			EXP	B1	
-	Behavior of smoothing with G64x			DWORD	NEW CONF	
-						
-	-	0, 0, 0, 0, 0, 0, 0, 0...	0	75744	7/7	U

Description:

Configuration of smoothing with G641 and G642 or G643.

The MD is decimal-coded. The units digits define the response with G643, and the tens digits the response with G642. The hundreds digit can define whether, with G641 or G642, the axes may be accelerated within the smoothing range or traversed at constant velocity. The thousands and ten-thousands digits are used to configure smoothing with G644.

x0: G643 uses axis-specific tolerances; these are set with the axis-specific MD33100 \$MA_COMPRESS_POS_TOL.

x1: G643 uses the contour tolerance SD42465 \$SC_SMOOTH_CONTUR_TOL for smoothing the geometry axes. The axis-specific tolerances in MD33100 \$MA_COMPRESS_POS_TOL are used for smoothing all other axes.

x2: The angular tolerance SD42466 \$SC_SMOOTH_ORI_TOL is used for smoothing the orientation movement. The axis-specific tolerances in MD33100 \$MA_COMPRESS_POS_TOL are used for all other axes.

x3: Combination of the two options 01 and 02. This means that G643 uses the tolerances SD42465 \$SC_SMOOTH_CONTUR_TOL and SD42466 \$SC_SMOOTH_ORI_TOL. All other axes are smoothed with an axis-specific tolerance.

x4: G643 uses the smoothing length programmed with ADIS= or ADISPOS=. The specification of possible axis-specific tolerances or contour and orientation tolerances is ignored.

2.3 NC machine data

0x: G642 uses axis-specific tolerances; these are set with the axis-specific MD33100 \$MA_COMPRESS_POS_TOL.

1x: G642 uses the contour tolerance for smoothing the geometry axes. The axis-specific tolerances in MD33100 \$MA_COMPRESS_POS_TOL are used for smoothing all other axes.

2x: The orientation movement with G642 is smoothed using the angular tolerance SD42466 \$SC_SMOOTH_ORI_TOL. The axis-specific tolerances in MD33100 \$MA_COMPRESS_POS_TOL are used for smoothing all other axes.

3x: Combination of both options 10 and 20. This means that G642 uses the tolerances SD42465 \$SC_SMOOTH_CONTUR_TOL and SD42466 \$SC_SMOOTH_ORI_TOL. Other axes are smoothed with an axis-specific tolerance.

4x: G642 uses the smoothing length programmed with ADIS= or ADISPOS=. The specification of possible axis-specific tolerances or contour and orientation tolerances is ignored.

Possible values of the hundreds digit (specification of path velocity for smoothing):

0xx: A profile of the limit velocity is calculated within the smoothing range from the specified maximum values for acceleration and jerk of the axes or path involved. This can lead to an increase in

path velocity in the smoothing range and consequently to an acceleration of the axes involved.

1xx: A profile of the limit velocity is not calculated for smoothing blocks with G641. Only a constant limit velocity is specified. In the case of smoothing with G641/G642, this prevents the axes involved accelerating in the

smoothing range. However, this setting may lead to smoothing blocks being traversed at a velocity that is too low, especially in the case of long smoothing ranges.

2xx: No velocity profile for G642 and G645 (see the above scenario for description).

4xx: The "effective" path velocity in a smoothing block will remain constant, if possible, as long as the dynamic response of the axes permits this. Unlike the default setting, the smoothing blocks are also interpolated as a path with this setting.

Possible values for the thousands digit (configuration of G644):

0xxx:

When smoothing with G644, the maximum deviations of each axis specified in MD COMPRESS_POS_TOL are adhered to. If the dynamic response of the axis allows, the specified tolerance may not be fully utilized.

1xxx:

When smoothing with G644, the smoothing distance is specified.

2xxx:

When smoothing with G644, the maximum frequency at which the smoothing movement of each axis occurs is limited. The maximum frequency is specified in MD32440 \$MA_LOOKAH_FREQUENCY.

3xxx:

When smoothing with G644, neither the tolerance nor the smoothing distance is monitored. Each axis traverses around a corner with the maximum possible dynamic response. With SOFT, both the maximum acceleration and the maximum jerk of each axis are observed. With BRISK, the jerk is not limited; instead, each axis traverses with the maximum possible acceleration.

4xxx:

When smoothing with G644, the maximum deviations of each axis specified in MD COMPRESS_POS_TOL are adhered to. In contrast to the value 0xxx, the specified tolerance is fully utilized where possible. The axis then does not reach its maximum possible dynamic response.

5xxx:

When smoothing with G644, the smoothing distance is specified (ADIS or ADISPOS). In contrast to the value lxxx, the specified smoothing distance is also fully utilized where possible. The axes involved then might not reach their maximum dynamic response. Possible values for the ten-thousands digit (various special setting options for G641/G642/G645):

0xxxx:

The velocity profiles of the axes in the smoothing range are defined without jerk limitation when BRISK is active, and with jerk limitation when SOFT is active.

1xxxx:

The velocity profiles of the axes in the smoothing range are always defined with jerk limitation no matter whether BRISK or SOFT is active.

2xxxx: When smoothing tangential block transitions with G645, "counter motion" may occur when moving along the contour. This can be avoided if circles are involved. If this function is activated, the circles involved are reduced by the set tolerance. As a consequence, the smoothed contour runs on the inner side of the tolerance band and "counter motion" is avoided.

4xxxx: When smoothing with G641/G642 and G645, the smoothing movements of the orientation axes are made with vector interpolation if possible, this is conditional upon vector interpolation being active in both the blocks involved and the active orientation transformation permitting this (e.g. by pole handling).

By default, the orientation axes are always smoothed by means of rotary axis interpolation.

The values of the units, tens, hundreds and ten-thousands digits are added.

The values of the thousands digit are interpreted individually.

MD33100 \$MA_COMPRESS_POS_TOL,

SD42465 \$SC_SMOOTH_CONTUR_TOL,

SD42466 \$SC_SMOOTH_ORI_TOL

20481	ORISMOOTHING_MODE			EXP	B1	
-	Behavior of smoothing of orientations with OST/OSD			DWORD	NEW CONF	
-						
-	-	1, 1, 1, 1, 1, 1, 1, 1...	0	12	7/7	U

Description:

Settings for the behavior of smoothing of orientation motions with OST/OSD.

It can be set how block transitions are smoothed if additional rotary axes are participating in a path motion which do not act as orientation axes in a transformation. If the value of this MD is zero, for OST/OSD at a block transition, only rotary axes that act as orientation axes in a transformation are smoothed. For values <> 0, any existing additional rotary axes are also smoothed, depending on the situation.

Meaning of the unit position:

x0: Additional rotary axes are not smoothed.

x1: Additional rotary axes are only smoothed if rotary axis interpolation is active for orientation.

x2: Additional rotary axes are smoothed even if vector interpolation is active. In this case, in both blocks it is switched to rotary axis interpolation. Depending on machine kinematics and situation, the switchover can cause undesired rotary axis movements (orientation changes).

Meaning of the decade:

0x: If no orientation transformation is active, rotary axis motions with OST/OSD are not smoothed.

1x: Even without active transformation, rotary axis motions are smoothed. This permits the active smoothing of rotary axes with OST/OSD even without active orientation transformation.

2.3 NC machine data

20482	COMPRESSOR_MODE	EXP	F2
-	Mode of compressor	DWORD	NEW CONF
-			
-	-	0, 0, 0, 0, 0, 0, 0, 0...	0 1333 7/7 U

Description:

This MD is used to set the compressor operating mode.

The units digits, the tens digits and the hundreds digits have different meanings.

The following options are available:

Units digits:

0: With the compressor, the tolerances specified with MD33100 \$MA_COMPRESS_POS_TOL are met for all axes (geometry and orientation axes).

1: With the compressor, the contour tolerances specified with SD42475 \$SC_COMPRESS_CONTUR_TOL are active for the geometry axes.

For the orientation axes, the axis-specific tolerances MD33100 \$MA_COMPRESS_POS_TOL are active.

2: With the compressor, the axis-specific tolerances MD33100 \$MA_COMPRESS_POS_TOL become active for the geometry axes. The orientation movement is compressed in compliance with the maximum angular deviations specified with SD42476 \$SC_COMPRESS_ORI_TOL or SD42477 \$SC_COMPRESS_ORI_ROT_TOL.

3: With the compressor, the contour tolerance SD42475 \$SC_COMPRESS_CONTUR_TOL becomes active for the geometry axes and the maximum angular deviation SD42476 \$SC_COMPRESS_ORI_TOL or SD42477 \$SC_COMPRESS_ORI_ROT_TOL becomes active for the orientation axes.

Tens digits:

The tens digits of this MD can be used to set a compressor response that is compatible with previous software releases (< SW 6.3).

0x: All blocks with orientations and value assignments are compressed.

This is the default setting.

Notice: This response is incompatible with previous software releases!

1x: Blocks with value assignments are not compressed (e.g. X=100 ..., etc.)

2x: Blocks with a programmed tool orientation are not compressed.

(e.g. A3= B3= C3=).

3x: All blocks with value assignments and/or programmed tool orientation are not compressed. With this setting, the response is fully compatible with previous software releases (< 6.3).

Hundreds digits:

The hundreds digit can be used to set which blocks in addition to G01 blocks are to be compressed or not:

0xx: Circular blocks and G00 blocks are not compressed. Is compatible with previous releases.

1xx: Circular blocks are linearized and compressed by COMPCAD.

2xx: G00 blocks are compressed; a different tolerance may be applied here (see MD 20560 \$MC_G0_TOLERANCE_FACTOR).

3xx: Combination of the two previous options: Both circular blocks and G00 blocks are compressed.

The thousands digits optimize the compressor for different machine types:

0xxx: Optimization for a good surface quality in tool and mold building.

1xxx: Optimization for soft and fast traversing in special applications.

Description: This MD is used to determine the settings for spline interpolation. The allocation of the spline segments to the NC blocks can thus be influenced. With spline interpolation, the spline blocks are combined, if possible, in such a way, that there are no blocks that are too short and could lead to a reduction in the possible path velocity.
Bit 0: With BSPLINE, blocks that are too short are avoided.
Bit 1: With BSPLINE/ORICURVE, blocks that are too short are avoided.
Bit 2: With CSPLINE, blocks that are too short are avoided.

20490	IGNORE_OVL_FACTOR_FOR_ADIS			EXP	B1	
-	G64x independent of overload factor			BOOLEAN	NEW CONF	
-						
-	-	FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE...	0	-	7/7	U

2.3 NC machine data

Description:

A block transition is normally only smoothed with G64x when the path velocity at block transition is reduced by the overload factor set in MD32310 \$MA_MAX_ACCEL_OVL_FACTOR. When SOFT is active, the maximum jerk occurring at block transitions is also limited by MD32432 \$MA_PATH_TRANS_JERK_LIM. This means that the effect of smoothing with G64x depends on the values set for the overload factor and possibly for the maximum jerk.

By setting MD20490 \$MC_IGNORE_OVL_FACTOR_FOR_ADIS = TRUE, a block transition can be smoothed with G64x, irrespectively of the values set for the overload factor.

20500	CONST_VELO_MIN_TIME			EXP, C05	B2	
s	Minimum time with constant velocity			DOUBLE	PowerOn	
-						
-	-	0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0...	0.0	0.1	7/2	M

Description:

Defines the minimum time for constant velocity during transition from acceleration to deceleration in short blocks in which the set velocity cannot be reached. Entering a time of at least several IPO cycles prevents a direct transition from the acceleration to the deceleration phase and thus reduces the acceleration jump to half. This acceleration limitation is only active with the acceleration profile BRISK.

MD irrelevant for:

Look Ahead does not take account of this function.

20550	EXACT_POS_MODE			EXP	B1	
-	Exact stop conditions on G00/G01.			BYTE	NEW CONF	
-						
-	-	0, 0, 0, 0, 0, 0, 0, 0...	0	33	7/2	M

Description:

Configuration of the exact stop conditions for G00 and other G codes of the 1st G code group.

The MD is decimal-coded. The units digits define the behavior at G00 (infeed motion) and the tens digits the behavior of all the other G codes of the 1st group ("machining G codes").

x0: At G00, the relevant programmed exact stop conditions become active.

x1: At G00, G601 (fine positioning window) becomes active independent of the programmed exact stop condition.

x2: At G00, G602 (coarse positioning window) becomes active independent of the programmed exact stop condition.

x3: At G00, G603 (setpoint value reached) becomes active independent of the programmed exact stop condition.

0x: At the machining G codes, the relevant programmed exact stop conditions become active.

1x: At the machining G codes, G601 (fine positioning window) becomes active independent of the programmed exact stop condition.

2x: At the machining G codes, G602 (coarse positioning window) becomes active independent of the programmed exact stop condition.

3x: At the machining G codes, G603 (setpoint value reached) becomes active independent of the programmed exact stop condition.

The values of the units digits and tens digits are added.

For example, the value of EXACT_POS_MODE = 2 means that the exact stop condition G602 is always activated automatically at G00, independently of which exact stop condition was programmed. At all other G codes of group 1, the programmed exact stop condition becomes active.

20552	EXACT_POS_MODE_G0_TO_G1	EXP	B1
-	Exact stop condition at G00-G01 transition	BYTE	NEW CONF
-			
-	-	0, 0, 0, 0, 0, 0, 0, 0...	0 5 7/2 M

Description:

Configuration of a stop at transition from G00 to a different G code of the 1st G code group, and also vice versa, at transition from non-G00 to G00 in continuous-path mode.

In exact-stop mode, the positioning window programmed or set in MD20550 \$MC_EXACT_POS_MODE is used.

The following applies:

- 0: No additional stop, no control of exact stop
- 1: Behavior active as with G601 (positioning window, fine).
- 2: Behavior active as with G602 (positioning window, coarse).
- 3: Behavior active as with G603 (setpoint reached).
- 4: As 0, no stop at block transition.

At block change from G0 to non-G0 in the G0 block in continuous-path mode, LookAhead takes account of the current value of the feedrate override of the following non-G0 block. Depending on the axis dynamics and the path length of the current block, the block change takes place with the exact or best possibly adapted velocity of the following block.

- 5: As 0, no stop at block transition.

At block change from G0 to non-G0 and non-G0 to G0 in continuous path mode, LookAhead takes account of the current value of the feedrate override (G0 to non-G0) or rapid traverse override (non-G0 to G0) of the following block. Depending on the axis dynamics and the path length of the current block, the block change takes place with the exact or best possibly adapted velocity of the following block.

The following applies to the velocity override of the path:

> 0: Limitation of the size of the selected increment
(MD11330 \$MN_JOG_INCR_SIZE [<increment/VDI signal>] or
SD41010 \$SN_JOG_VAR_INCR_SIZE) / 1000*IPO sampling time
= 0: No limitation

20623	HANDWH_ORIAX_MAX_INCR_VSIZE	C08, C06, C05	-
rev/min	Orientation velocity overlay	DOUBLE	PowerOn
-			
-	-	0.1, 0.1, 0.1, 0.1, 0.1, 0.1, 0.1, 0.1...	0.0
		1.0E+301	7/2
			M

Description:

For the orientation velocity overlay:

> 0: Limitation of the size of the selected increment
(MD11330 \$MN_JOG_INCR_SIZE [< increment/VDI signal>] or
SD41010 \$SN_JOG_VAR_INCR_SIZE) / 1000 * IPO sampling time
= 0: No limitation

20624	HANDWH_CHAN_STOP_COND	EXP, C09	H1, P1
-	Definition of response of handwheel travel, channel-specific	UDWORD	PowerOn
-			
-	-	0x13FF, 0x13FF, 0x13FF, 0x13FF, 0x13FF, 0x13FF, 0x13FF, 0x13FF...	0
		0x1FFFF	7/2
			M

Description:

Definition of the response for handwheel travel to channel-specific VDI interface signals (bit 0 to bit 7) or CP-SW limit stop or stop by an OEM application (bit 7):

Bit = 0:

Interruption or collection of the displacements entered via the handwheel.

Bit = 1:

Traversing canceled and no collecting.

Bit assignment:

Bit 0: Mode group stop

Bit 1: Mode group stop, axes plus spindle

Bit 2: NC stop

Bit 3: NC stop, axes plus spindles

Bit 4: Feedrate disable (exception for MD30460 \$MA_BASE_FUNCTION_MASK bit6)

For bit 4 feed disable, it must be taken into account that a PLC-controlled axis, for which MD30460 \$MA_BASE_FUNCTION_MASK bit 6 = 1, is not stopped by the feed disable, and that no interruption and no cancellation are triggered here.

Bit 5: Feedrate override

Bit 6: Rapid traverse override

Bit 7: Feedrate stop, geometry axis or CP-SW limit stop or stop by an OEM application

Bit 8 = 0:

The maximum feedrate for handwheel travel of geometry axes is that specified in machine data JOG_AX_VELO for the corresponding machine axis/axes.

Bit 8 = 1:

The maximum feedrate for handwheel travel of geometry axes is that specified in machine data MAX_AX_VELO for the corresponding machine axis/axes.

Bit 9 = 0:

The override is active during handwheel travel of geometry axes.

Bit 9 = 1:

2.3 NC machine data

During handwheel travel of geometry axes, the override is assumed to be 100% irrespective of the position of the override switch.

Exception: override 0, which is always active.

Bit 10 = 0:

MD11310 \$MN_HANDWH_REVERSE is not active for DRF, i.e. handwheel travel with DRF is carried out as if MD11310 \$MN_HANDWH_REVERSE = 0.

Bit 10 = 1:

MD11310 \$MN_HANDWH_REVERSE is active for DRF.

Bit 11 = 0:

When the contour handwheel is deselected, program processing is continued automatically.

Bit 11 = 1:

When the contour handwheel is deselected, an NCSTOP is triggered automatically. Program processing is not continued until NCSTART is entered.

Bit 12 = 0:

NC start has no effect on handwheel travel.

Bit 12 = 1:

The previously collected paths are rejected at NC start.

Bit 13 = 0:

For DRF, bits 0 - 3 and bit 12: bit = 0 / bit = 1 are active (see above).

Bit 13 = 1:

For DRF, bits 0 - 3 and bit 12 are NOT active: the DRF motion is not interrupted by a stop, and a DRF motion can take place even in "Automatic interrupted" state (achieved by NC Stop).

Note:

If an alarm leads to an axis stop and if such an alarm is pending, no DRF motion can take place.

Bit 14 = 0:

The maximum feedrate for handwheel travel of geometry axes is that specified in SD41120 \$SN_JOG_REV_SET_VELO or in MD32050 \$MA_JOG_REV_VELO (for revolutionary feedrate) or in MD32040 \$MA_JOG_REV_VELO_RAPID (for rapid traverse) for the corresponding machine axis, the spindle or rotary axis feedrate is included in the calculation.

Bit 14 = 1:

The maximum rotational feedrate for handwheel travel of geometry axes is the feedrate specified in MD32000 \$MA_MAX_AX_VELO for the corresponding machine axis (see also bit 6).

Bit 15 = 0:

If an axis with active diameter programming is traversed in the channel, only half the distance of the specified increment is traveled during handwheel travel (MD11346 \$MN_HANDWH_TRUE_DISTANCE = 1 or 3).

Bit 15 = 1:

If an axis with active diameter programming is traversed in the channel, the specified increment is fully traveled during handwheel travel (MD11346 \$MN_HANDWH_TRUE_DISTANCE = 1 or 3).

Bit 16 = 0:

Return traveling is possible to the start of the block.

Bit 16 = 1:

Return traveling is not possible (response as at start of block, i.e. pulses are ignored).

20700	REFP_NC_START_LOCK	C01, C03	D1, R1, Z1
-	NC start disable without reference point	BYTE	Reset
-			
-	-	1, 1, 1, 1, 1, 1, 1, 1...	0 2 7/2 M

Description:

0: The NC/PLC interface signal DB21-30 DBX7.1 (NC start) for starting part programs or part program blocks (MDI and overstore) is active even if one or all axes of the channel have not yet been referenced.

To ensure that the axes nevertheless reach the correct position after NC startup, the work (workpiece coordinate system = work) must be set to the correct value by means of other methods (scratch method, automatic work offset determination etc.).

1: Axes for which the axial MD34110 \$MA_REFP_CYCLE_NR specifies that a reference point is mandatory (value > -1), must be referenced for NC startup to be enabled.

2: Advanced form of setting 1 in that the axis state "Position restored" (instead of "referenced") is sufficient for NC startup in MDI or overstore.

20730	G0_LINEAR_MODE	C09	P2
-	G0 interpolation mode	BOOLEAN	PowerOn
-			
-	-	TRUE, TRUE, TRUE, TRUE, TRUE, TRUE, TRUE, TRUE...	0 - 7/2 M

Description:

This machine data defines the interpolation behavior of G0:

0: Non-linear interpolation (RTLIOF): Each path axis interpolates as an individual axis (positioning axis), independently of the other axes, at the rapid traverse velocity of the axis (MD32000 \$MA_MAX_AX_VELO).

However, this is possible only in simple cases:

- No transformation active (TRAORI, TRANSMIT etc.).
- G60 active (stop at end of block).
- No compressor active (COMPOF).
- No tool radius compensation active (G40).
- No contour handwheel selected.
- No nibbling active.

If one of these conditions is not fulfilled, linear interpolation takes place with the value 1 (RTLION).

1: Linear interpolation (RTLION): The path axes are interpolated jointly.

20734	EXTERN_FUNCTION_MASK	N12	-
-	Function mask for external language	UDWORD	Reset
-			
-	-	0, 0, 0, 0, 0, 0, 0, 0...	0 0x7FFFFFFF 7/2 M

Description:

This machine data is used to influence functions in ISO mode.

Bit0: 0:

ISO mode T: "A" and "C" are interpreted as axes. If contour definition has been programmed, "A" or "C" must be preceded by a comma.

1:

"A" and "C" in the part program are always interpreted as a contour definition. An axis "A" or "C" is not allowed.

Bit1: 0:

ISO mode T: G10 P < 100 tool geometry
P > 100 tool wear

1:

2.3 NC machine data

```

G10 P < 10000 tool geometry
    P > 10000 tool wear

Bit2: 0:
G04 dwell time: always [s] or [ms]
    1:
If G95 is active, in spindle revolutions
Bit3: 0:
Errors in ISO mode lead to an alarm
    1:
Errors in ISO mode are not output, the block is translated in Siemens mode.
Bit4: 0:
G00 is traversed with the current exact stop - continuous-path mode G code
    1:
G00 is always traversed with G09
Bit5: 0:
Modulo rotary axis is positioned at the shortest possible distance
    1:
Direction of rotation of modulo rotary axis depends on sign
Bit6: 0:
Only 4-digit program number allowed.
    1:
8-digit program number allowed. If the program number has less than 4 digits, it is
expanded to 4 digits with 0.
Bit7: 0:
Axis programming for geometry axis exchange/parallel axes is compatible with ISO mode.
    1:
Axis programming for geometry axis exchange/parallel axes in ISO mode is compatible
with Siemens mode.
Bit8: 0:
With cycles, the F value transferred is always interpreted as a feedrate.
    1:
With threading cycles, the F value transferred is interpreted as a pitch.
Bit9: 0:
Multiplication with 0.01mm / 0.0001inch is carried out in ISO mode T for G84, G88 and
in standard mode F for G95.
    1:
Multiplication with 0.001mm / 0.00001inch is carried out in ISO mode T for G84, G88
and in standard mode F for G95.
Bit10: 0:
With M96 Pxx, the program programmed with Pxx is always called in the case of an
interrupt
    1:
With M96 Pxx, CYCLE396.spf is always called in the case of an interrupt
Bit11: 0:
With G54 Pxx, only G54.1 is displayed
    1:
With G54 Pxx, the programmed program is displayed after the point, e.g. G54.48
Bit12: 0:
When the subroutine defined with M96 Pxx is called, $P_ISO_STACK is not modified
    1:

```

When the subroutine defined with M96 Pxx is called, \$P_ISO_STACK is incremented

Bit13: 0:

G10 is executed without internal STOPRE

1:

G10 is executed with internal STOPRE

Bit14: 0:

ISO mode T: No alarm if a cutting edge has been programmed in the T command.

1:

ISO mode T: Alarm 14185 if a cutting edge has not been programmed in the T command.

Bit 15: 0:

ISO mode M: G51 Scale, the axial scale factors I, J, K work with 'pocket calculator notation' as programmed.

1:

ISO mode M: G51 Scale, the axial scale factors I, J, K with 'pocket calculator notation', are multiplied by the value in MD22910 \$MC_WEIGHTING_FACTOR_FOR_SCALE.

Bit 16: 0:

In circular-path programming with radius R, there is no replacement of missing geometry axes of the selected plane. This corresponds to the behavior in Siemens mode

1:

In circular-path programming with radius R, missing geometry axes of the selected plane are supplemented by incremental distance 0

20750	ALLOW_G0_IN_G96			C09, C05	P2, V1	
-	G0 logic with G96, G961			BOOLEAN	PowerOn	
-						
-	-	TRUE, TRUE, TRUE, TRUE, TRUE, TRUE, TRUE, TRUE...	0	-	7/2	M

Description:

This machine data defines the speed regulation characteristic of the spindle in G0 blocks with constant cutting speed (G96, G961) selected .

1: In a G0 block, the spindle speed is kept constant at the last value of the previous block that was unequal G0.

Prior to a subsequent block that does not contain G0, the spindle speed is increased to a value that belongs to the transverse axis position of the subsequent block.

0: In a G0 block, the spindle speed changes against the transverse axis position.

20800	SPF_END_TO_VDI			C04, C03	H2, K1	
-	End of subroutine to PLC			BYTE	PowerOn	
-						
-	-	1, 1, 1, 1, 1, 1, 1, 1...	-	-	7/2	M

Description:

Bit 0 = 1:

The M functions for subroutine end (M17 and/or M2/M30) are transferred to the PLC interface.

Bit 0 = 0:

The M functions for subroutine end (M17 and/or M2/M30) are not transferred to the PLC interface.

Note:

To prevent stopping in continuous-path mode, M17 must not be programmed alone in a block.

Example of a subroutine: G64 F2000 G91 Y10 X10

X10 Z10 M17

2.3 NC machine data

Bit 1 = 0:

M01:

conditional program stop is always output to PLC, irrespective of whether the M01 signal is active or not.

Fast auxiliary function output M=QU(1) is inactive because M01 is assigned to the 1st M function group and thus is always output at block end.

Bit 1 = 1:

M01:

conditional program stop is only output to PLC, if M01 is also active.

This thus enables optimal run-time processing of the part program.

With fast auxiliary function output M=QU(1), M1 is output during the movement; thus it is possible to traverse blocks in continuous-path mode with programmed M01 as long as M01 is not active.

The request of the M01 signal with M=QU(1) no longer occurs at block end but during the movement.

20850	SPOS_TO_VDI			C04, C03	S1	
-	Output of M19 to PLC on SPOS/SPOSA			BYTE	PowerOn	
-						
-	-	0, 0, 0, 0, 0, 0, 0, 0...	-	-	7/2	M

Description:

Bit 0 = 0:

When bit 19 is also set to '0' in MD35035 \$MA_SPIND_FUNCTION_MASK, auxiliary function M19 is not generated with SPOS and SPOSA. This also eliminates the acknowledgment time for the auxiliary function, which can cause faults with very short blocks.

Bit 0 = 1:

When SPOS and SPOSA are programmed in the part program, auxiliary function M19 is generated and output to the PLC. The address extension corresponds to the spindle number.

Related to:

SPIND_FUNCTION_MASK

20900	CTAB_ENABLE_NO_LEADMOTION			EXP	M3	
-	Curve tables with jump of slave axis			BYTE	Reset	
-						
-	-	0, 0, 0, 0, 0, 0, 0, 0...	0	2	7/2	M

Description:

This MD is used to configure the way jumps of the slave axis are processed in curve tables. A jump of the slave axis results from the presence of a movement of the slave axis in a segment of the curve table with no corresponding movement of the master axis. The jumps of the slave axis may be programmed directly, or they are created internally in the control.

These segments may be created especially if a curve table with active tool radius compensation is generated.

The following configurations are possible:

0: No curve tables are created that contain a jump of the slave axis. If a jump of the slave axis occurs, alarm 10949 (CTAB_NO_LEADMOTION) is issued and program processing is terminated. This setting is compatible with previous software versions.

1: Curve tables containing a jump of the slave axis may be implemented. If a jump of the slave axis occurs, alarm 10955 (CTAB_NO_LEADMOTIONWARNING) is issued without terminating program processing.

2: Curve tables with jumps of the slave axis are implemented without issuing an alarm or a note.

20905	CTAB_DEFAULT_MEMORY_TYPE			EXP	M3	
-	Default memory type for curve tables			BYTE	Reset	
-						
-	-	0, 0, 0, 0, 0, 0, 0, 0...	0	1	7/2	M

Description: This machine data defines the memory (SRAM or DRAM) in which the curve tables are created by default.

This MD is only relevant if no memory type was specified when defining a curve table using CTABDEF().

The following settings can be selected:

0: By default, curve tables are created in the SRAM.

1: By default, curve tables are created in the DRAM.

21000	CIRCLE_ERROR_CONST			C06	-	
mm	Circle end point monitoring constant			DOUBLE	NEW CONF	
-						
-	-	0.01, 0.01, 0.01, 0.01, 0.01, 0.01, 0.01, 0.01...	0.0	1.0E+301	7/2	M

Description: This machine data is used to specify the permissible absolute circle error [mm].

When a circle is programmed, both conditions (that the distances from the programmed center point to the start and end points (circle radius) must be the same and that the center point of the circle must be located on the perpendicular bisector of the straight line connecting the start and end points (perpendicular bisector of the circular plane)) apply.

The fact that the circular parameters can be freely programmed means that these conditions are not usually met exactly in the case of circle programming with I, J, and K (the circle is "overdefined").

The maximum permissible difference between the two radii that is accepted without an alarm, as well as the distance between the programmed center point of the circle and the perpendicular bisector described above, is defined by the larger value in the following data:

- MD21000 \$MC_CIRCLE_ERROR_CONST
- Start radius multiplied by MD21010 \$MC_CIRCLE_ERROR_FACTOR

This means that for small circles the tolerance is a fixed value (MD21000 \$MC_CIRCLE_ERROR_CONST), and for large circles it is proportional to the start radius.

Related to:

MD21010 \$MC_CIRCLE_ERROR_FACTOR
(circle end point monitoring factor)

In the context of the predefined tolerances, conflicting circle data is compensated essentially by moving the center point of the circle. Please note that the deviation between the programmed center point and the actual center point can reach the order of magnitude set with machine data MD21000 \$MC_CIRCLE_ERROR_CONST and/or MD21010 \$MC_CIRCLE_ERROR_FACTOR. In the case of circles which are almost full circles in particular, this can also lead to contour deviations of the same order of magnitude.

21010	CIRCLE_ERROR_FACTOR			C06	-	
-	Circle end point monitoring factor			DOUBLE	NEW CONF	
-						
-	-	0.001, 0.001, 0.001, 0.001, 0.001, 0.001, 0.001, 0.001...	0.0	1.0E+301	7/2	M

Description: Factor for permissible radius difference.

2.3 NC machine data

Defines the factor for large circles by which the starting radius and end radius may deviate from each other

(see also MD21000 \$MC_CIRCLE_ERROR_CONST (circle end point monitoring constant)).

When a circle is programmed, both conditions (that the distances from the programmed center point to the start and end points (circle radius) must be the same and that the center point of the circle must be located on the perpendicular bisector of the straight line connecting the start and end points (perpendicular bisector of the circular plane)) apply.

The fact that the circular parameters can be freely programmed means that these conditions are not usually met exactly in the case of circle programming with I, J, and K (the circle is "overdefined").

The maximum permissible difference between the two radii that is accepted without an alarm, as well as the distance between the programmed center point of the circle and the perpendicular bisector described above, is defined by the larger value in the following data:

- MD21000 \$MC_CIRCLE_ERROR_CONST
- Start radius multiplied by MD21010 \$MC_CIRCLE_ERROR_FACTOR

This means that for small circles the tolerance is a fixed value (MD21000 \$MC_CIRCLE_ERROR_CONST), and for large circles it is proportional to the start radius.

Related to:

MD21000 \$MC_CIRCLE_ERROR_CO'NST

(circle end point monitoring factor)

In the context of the predefined tolerances, conflicting circle data is compensated essentially by moving the center point of the circle. Please note that the deviation between the programmed center point and the actual center point can reach the order of magnitude set with machine data MD21000 \$MC_CIRCLE_ERROR_CONST and/or MD21010 \$MC_CIRCLE_ERROR_FACTOR. In the case of circles which are almost full circles in particular, this can also lead to contour deviations of the same order of magnitude.

21015	INVOLUTE_RADIUS_DELTA			C06	A2	
mm	Involute end point monitoring			DOUBLE	PowerOn	
-						
-	-	0.01, 0.01, 0.01, 0.01, 0.01, 0.01, 0.01, 0.01...	0.0	1.0E+301	7/2	M

Description:

Permissible absolute difference of radius at involute interpolation [mm].

At involute interpolation, the radius of the basic circle determined by the end point may differ from the programmed radius.

This data is used to limit the permissible maximum difference between start radius and end radius.

21016	INVOLUTE_AUTO_ANGLE_LIMIT			C06	A2	
-	Automatic angle limitation during involute interpolation			BOOLEAN	PowerOn	
-						
-	-	FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE...	0	-	7/2	M

Description:

If the angle of rotation is programmed for an involute (AR=angle), the maximum angle of rotation is limited in case the involute is travelling towards the basic circle (AR < 0). The maximum angle of rotation is reached when the involute touches the basic circle.

Normally, if an angle larger than the maximum angle is programmed, an alarm is issued and the NC program canceled.

If this MD is set to TRUE any angle is accepted without an alarm for programming. If required, this angle is limited automatically.

21020	WORKAREA_WITH_TOOL_RADIUS			C03, C06	A3	
-	Consideration of tool radius for working area limitation			BOOLEAN	Reset	
-						
-	-	FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE...	0	-	7/2	M

Description: This machine data indicates whether the tool radius is taken into account in the working area limitation.

0: It is checked whether the tool center lies within the working area limits.

1: The tool radius is taken into account when the working area limitation is checked. This means that the working area is reduced by the tool radius.

21050	CONTOUR_TUNNEL_TOL			C06	K6	
mm	Response threshold for contour tunnel monitoring			DOUBLE	NEW CONF	
-						
-	-	0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0...	0.0	1.0E+301	7/2	M

Description: Response threshold for contour tunnel monitoring. Defines the radius of the "tunnel" around the path of the tool tip.

If three geometry axes are defined, the tunnel can be regarded as a tube through the center of which the path of the tool tip travels.

If only two geometry axes are defined, this tube can be regarded as squashed flat in the plane of the two geometry axes.

Monitoring is only active if:

- option contour tunnel monitoring is present and
- MD21050 \$MC_CONTOUR_TUNNEL_TOL is larger than 0.0 and
- at least two and at most three geometry axes are defined.

Related to:

MD21060 \$MC_CONTOUR_TUNNEL_REACTION,

MD21070 \$MC_CONTOUR_ASSIGN_FASTOUT,

MD36500 \$MA_ENC_CHANGE_TOL

21060	CONTOUR_TUNNEL_REACTION			C06	K6	
-	Reaction when contour tunnel monitoring responds			BYTE	PowerOn	
-						
-	-	1, 1, 1, 1, 1, 1, 1...	0	2	7/2	M

Description: Reaction to response of the alarm

0: Only display alarm, continue machining

1: Ramp stop

2: Rapid stop

MD irrelevant:

If the contour tunnel monitoring option is not available

Related to:

MD21050 \$MC_CONTOUR_TUNNEL_TOL, MD21070 \$MC_CONTOUR_ASSIGN_FASTOUT

21070	CONTOUR_ASSIGN_FASTOUT			C01, C06	K6	
-	Assignment of an analog output for the output of contour error			BYTE	PowerOn	
-						
-	-	0, 0, 0, 0, 0, 0, 0, 0...	0	8	7/2	M

2.3 NC machine data

Description: Assignment of an analog output on which the calculated contour error can be output.

0: No output
 1: Output on output 1
 2: Output on output 2
 etc.
 8: Output on output 8

An error as large as the response threshold MD21050 \$MC_CONTOUR_TUNNEL_TOL appears on the output as a voltage of 10V.

Multiple assignment of the same output by other signals is checked automatically.

MD irrelevant:

If the contour tunnel monitoring option is available

Related to:

MD21050 \$MC_CONTOUR_TUNNEL_TOL, MD21060 \$MC_CONTOUR_TUNNEL_REACTION

21080	CUTCOM_PARALLEL_ORI_LIMIT			C08, C06	-	
degrees	Minimum angle (path tangent / tool orientation) in 3D TRC			DOUBLE	Reset	
-						
-	-	3., 3., 3., 3., 3., 3., 3., 3....	0.1	89.	7/2	M

Description: With 3D tool radius compensation, the angle between the path tangent and the tool orientation may not drop below a certain limit angle. This machine data specifies this angle (in degrees).

Generally speaking, the lower the value entered in this machine data, the greater the computing capacity required to check that the above conditions are fulfilled.

Linear blocks with constant orientation are an exception.

21082	CUTCOM_PLANE_ORI_LIMIT			C08, C06	-	
degrees	Minimum angle between surface normal vector and tool orientation			DOUBLE	Reset	
-						
-	-	3., 3., 3., 3., 3., 3., 3., 3....	1.0	89.	7/2	M

Description: This machine data applies to 3D face milling operations and specifies the minimum angle that must exist between the surface normal vector and the tool orientation on every point of the path if the applied lateral angle is not equal to zero and the tool is not a ball mill. Otherwise, machining is canceled with an alarm if the angle is smaller than the value set here.

Generally speaking, the lower the value entered in this machine data, the greater the computing capacity required to check that the above conditions are fulfilled. This data has no effect in linear blocks with constant orientation. The angle between the surface normal vector and tool orientation may be as small as desired in such cases, even if the lateral angle is not equal to zero.

21084	CUTCOM_PLANE_PATH_LIMIT			C08, C06	W5	
degrees	Min. angle betw. surface normal vector and path tangent vector			DOUBLE	Reset	
-						
-	-	3., 3., 3., 3., 3., 3., 3., 3., 3....	1.0	89.	7/2	M

Description: This machine data applies to 3D face milling operations and specifies the minimum angle that must exist between the surface normal vector and the path tangent vector on every point of the path. Otherwise machining is canceled with an alarm if the angle is smaller than the value set here.

Generally speaking, the lower the value entered in this machine data, the greater the computing capacity required to check that the above conditions are fulfilled.

21090	MAX_LEAD_ANGLE	C08, C09	M1
degrees	Maximum value of permitted lead angle for orientation progr.	DOUBLE	NEW CONF
-			
-	-	80., 80., 80., 80., 80., 80., 80., 80....	0. 80. 7/7 U

Description: Maximum permissible value of the lead angle in degrees.

21092	MAX_TILT_ANGLE	C08, C09	M1
degrees	Maximum value of permitted side angle for orientation progr.	DOUBLE	NEW CONF
-			
-	-	180., 180., 180., 180., 180., 180., 180., 180....	-180. 180. 7/7 U

Description: Maximum permissible value of the tilt angle in degrees.

21094	ORIPATH_MODE	C02	F2
-	Setting for ORIPATH path-relative orientation	DWORD	NEW CONF
-			
-	-	0, 0, 0, 0, 0, 0, 0, 0...	0 11241 7/7 U

Description: This MD is used to set the response for ORIPATH, i.e. path-relative interpolation of tool orientation.

The various digits of this machine data are used to activate different functions for ORIPATH.

The tens digit of this MD enables the specification of the way in which the programmed LEAD and TILT angles are to be interpreted.

This setting option is also significant without active ORIPATH if offsets have been programmed for the LEAD and TILT angles

(with \$P_OFF_LEAD and \$P_OFF_TILT or \$AC_OFF_LEAD and \$AC_OFF_TILT).

Meaning of the units digit: Activation of "true" path-relative orientation interpolation

xxx0:

The tool orientation has the relation to the path tangent and the normal vector programmed with LEAD and TILT only at the end of the block; within the block, the orientation does not follow the path tangent. This corresponds to the response in SW release 6.xx.

xxx1:

The tool orientation relation to the path tangent and the surface normal vector programmed with LEAD/TILT is retained throughout the block. Meaning of the tens digit: Interpretation of the TILT angle.

Meaning of the tens digit: Interpretation of the LEAD and TILT angles. This applies both to the angles programmed with LEAD and TILT with path-relative orientation interpolation (ORIPATH),

as well as to offsets of the LEAD and TILT angles, which can also be programmed without ORIPATH by means of \$P_OFF_LEAD and \$P_OFF_TILT or \$AC_OFF_LEAD and \$AC_OFF_TILT.

With path-relative orientation, the coordinate system is formed by the two vectors path tangent and normal vector. If an offset is applied to a programmed orientation, the current orientation itself takes over the role of the normal vector. A plane is then formed by the current orientation and the path tangent, in which the rotation is made perpendicularly with the LEAD angle or the TILT angle.

xx0x:

2.3 NC machine data

The angles programmed with LEAD and TILT are evaluated in the following rotation sequence:

1. LEAD = Rotation around direction vertical to tangent and normal vector/orientation vector (forward angle)
2. TILT = Rotation of orientation around normal vector

This is the interpretation of the LEAD/TILT angles in SW releases < 7.2

xx1x:

The angles programmed with LEAD and TILT are evaluated in the following rotation sequence:

1. LEAD = Rotation around direction vertical to tangent and normal vector/orientation vector (forward angle)
2. TILT = Rotation of orientation around vector in direction of tangent (tilt angle)

xx2x:

The angles programmed with LEAD and TILT are evaluated in the following rotation sequence:

1. LEAD = Rotation around direction vertical to tangent and normal vector/orientation vector (forward angle)
2. TILT = Rotation of orientation around vector in direction of rotated (new) tangent (tilt angle)

xx3x:

The angles programmed with LEAD and TILT are evaluated in the following rotation sequence:

1. TILT = Rotation of orientation around vector in direction of tangent (tilt angle)
2. LEAD = Rotation around direction vertical to tangent and normal vector/orientation vector (forward angle)

xx4x:

The angles programmed with LEAD and TILT are evaluated in the following rotation sequence:

1. TILT = Rotation of orientation around vector in direction of tangent (tilt angle)
2. LEAD = Rotation around direction vertical to tangent and rotated (new) normal vector/orientation vector (forward angle)

Meaning of hundreds digit: Activation of a retract movement in the case of reorientation.

0xx:

In the case of reorientation with ORIPATH, a retract movement is not executed.

1xx:

In the case of reorientation with active ORIPATH, a retract movement in the direction of the programmed vector is executed. The programmed vector for the direction of the retract movement refers to the coordinate system defined by the current tool direction (z coordinate) and the change in orientation (x coordinate).

2xx:

In the case of reorientation with active ORIPATH, a retract movement in the direction of the programmed vector is executed. The programmed vector for the direction of the retract movement refers to the coordinate system defined by the current surface normal vector (z coordinate) and the change in orientation (x coordinate).

A retract movement is possible only with a "true" path-relative orientation interpolation, i.e. if the units digit of this MD has a value of one.

Meaning of the thousands digit: Response of path-relative orientation on activation / deactivation of tool offset.

0xxx:

The path-relative orientation is also retained in activation / deactivation blocks associated with tool offset.

1xxx:

The path-relative orientation is not retained in activation / deactivation blocks associated with tool offset. In these blocks, the tool orientation usually remains constant. However, tool orientation can be programmed in these blocks and then traversed there, although any orientation has to be programmed with vectors (the programming of rotary axis positions is not permitted).

21100	ORIENTATION_IS_EULER			C01, C09	F2, TE4, M1	
-	Angle definition for orientation programming			BOOLEAN	NEW CONF	
-						
-	-	TRUE, TRUE, TRUE, TRUE, TRUE, TRUE, TRUE, TRUE...	0	-	7/7	U

Description:

This data is only active for MD21102 \$MC_ORI_DEF_WITH_G_CODE = 0

MD = 0 (FALSE):

The values programmed with A2, B2, C2 during orientation programming are interpreted as an RPY angle (in degrees).

The orientation vector is produced by rotating a vector in direction Z first by C2 around the Z axis, then by B2 around the new Y axis and finally by A2 around the new X axis. In contrast to Euler angle programming, all three values influence the orientation vector in this case.

MD = 1 (TRUE):

The values programmed with A2, B2, C2 during orientation programming are interpreted as Euler angles (in degrees).

The orientation vector is produced by rotating a vector in direction Z first by A2 around the Z axis, then by B2 around the new X axis and finally by C2 around the new Z axis. This means that the value of C2 is meaningless.

21102	ORI_DEF_WITH_G_CODE			C01, C07	F2

-	Coordinate systems for Cartesian JOG			UDWORD	PowerOn	
-						
-	-	0, 0, 0, 0, 0, 0, 0, 0...	0	7	7/2	M

Description: This machine data has two meanings. First, it is used to activate the "Cartesian manual traverse" function. Second, it is used to determine the reference systems between which a switchover can be performed.
 The meaning of the individual bits is determined as follows:
 Bit 0 : Basic coordinate system
 Bit 1 : Workpiece coordinate system
 Bit 2 : Tool coordinate system

2.3 NC machine data

21108	POLE_ORI_MODE	C07	F2
-	Response with vector interpolation in pole position	DWORD	NEW CONF
-			
-	-	0, 0, 0, 0, 0, 0, 0, 0...	0
		11122	7/7
			U

Description:

This MD defines how the change in orientation in the case of vector interpolation is treated if the orientation runs through the pole taper, which is defined by MD24540, 24640, 25240, 35340 \$MC_TRAFO5_POLE_LIMIT_1, 2, 3, 4.

Vector interpolation is present, if tool orientation is interpolated independent of the kinematics, e.g. by means of large circle interpolation (orientation is swiveled in a plane), taper interpolation or through interpolation of a 2nd reference point on the tool (ORICURVE), and not directly the orientation axes.

In the pole, the pole axis can have any position. For large circle interpolation, however, this axis requires a certain orientation.

If the start orientation is equal or close to the pole orientation and the end orientation of the block lies outside the tolerance circle defined by machine data TRAF05_POLE_LIMIT_n, the pole axis can be moved to a position suitable to ensure that the subsequent vector interpolation can be carried out. This is set via the units and tens digits of this machine data.

The units digits can have the following values (active if start orientation is equal to pole orientation):

0: The interpolation is carried out as an axis interpolation. The specified orientation path (large circle) is followed only if the pole axis (coincidentally) has the right position and the basic orientation is perpendicular to the 2nd rotary axis.

1: A block, that positions the pole axis such that large circle interpolation can be carried out in the subsequent block, is inserted before the block where the described situation occurs.

2: If the block preceding the block, in which the described situation occurs, contains a geometry axis movement but no orientation movement, the required positioning movement of the pole axis is additionally carried out in this previous block.

If one of the two conditions is not fulfilled (block does not contain a geometry axis movement or block contains an orientation movement), the pole axis movement is carried out in a separate block (same behavior as under 1.)

The tens digits can have the following values (active if the start orientation differs from the pole orientation, but lies within the tolerance circle defined by TRAF05_POLE_LIMIT_n):

00: The interpolation is carried out as an axis interpolation. The specified orientation path (large circle) is followed only if the pole axis (coincidentally) has the right position and the basic orientation is perpendicular to the 2nd rotary axis.

10: A block that positions the two rotary axes to the point where the programmed large circle interpolation intersects with the tolerance circle defined by TRAF05_POLE_LIMIT_n is inserted before the block where the described situation occurs. In the original block, large circle interpolation is applied as of this point.

20: If the block preceding the block in which the described situation occurs contains a geometry axis movement but no orientation movement, the necessary positioning movements of the two rotary axes are additionally carried out in this previous block. The residual movement in the original block is the same as that of value 10 of this machine data.

If one of the two conditions is not fulfilled (block does not contain a geometry axis movement or block contains an orientation movement), the pole axis movement is carried out in a separate block (same behavior as under 10.)

The hundreds digit of this MD is used to set the behavior in case the orientation runs through the pole taper or ends within the pole taper.

The hundreds digit can have the following values:

000: A block with the orientation running within the pole taper is subdivided only if the start orientation is equal to the pole orientation (with POLE_ORI_MODE = 1) or is close to the pole orientation (with POLE_ORI_MODE = 10). If the pole orientation occurs at an arbitrary point in the block, the whole change in orientation is traversed by means of rotary axis interpolation. In general, this leads to a more or less significant deviation from the programmed orientation path.

100: If the programmed orientation path runs through the pole taper, the block is subdivided in up to 3 parts, so that there is a deviation from the orientation path only within the pole taper. Outside the pole taper, the orientation is interpolated exactly on the programmed orientation path.

The pole handling behavior with active ORIANGLE (interpolation of orientation in virtual axis angles) is set with the thousands digit of the MD.

0xxx: With this setting, the normal pole behavior is active even if ORIANGLE is active. If the transformation causes a switchover to axis interpolation due to a pole, orientation is interpolated by means of the real rotary axes. This can result in considerable deviations from the programmed orientation path. Any different settings of the MD \$MC_POLE_ORI_MODE are also effective. This means, for example, that by means of the setting MD21108 \$MC_POLE_ORI_MODE = 100, this behavior can be changed such that deviations from the programmed orientation path only occur within the pole taper.

1xxx: If ORIANGLE is active, there is never a switchover to the interpolation of the orientation by means of real rotary axes. The orientation is always interpolated with virtual axis angles (e.g. Euler angle or RPY angle). Different settings of the MD21108 \$MC_POLE_ORI_MODE do not become effective. For example, with MD21108 \$MC_POLE_ORI_MODE = 1100 the division of the orientation movement, which was activated by the value 100, does not become effective. Therefore, if MD21108 \$MC_POLE_ORI_MODE = 1xxx, the units, tens and hundreds digits are ignored.

Using the ten thousands digit, it is possible to set whether for the generic 5/6 axis transformation, alarm 14112 should be output, if the intermediate orientations do not lie in the orientation range of the kinematics but final orientation of the block is possible:

0xxxx: The intermediate orientations are checked, as to whether these can be reached. If an orientation characteristic is programmed which goes through the range that cannot be reached, alarm 14112 (program orientation path not possible) is output.

1xxxx: The intermediate orientations are checked as to whether these can be reached. However, no alarm is output if the orientation runs through the range that cannot be reached, instead, the orientation change is performed using the rotary axis interpolation. This can result in significant deviations in orientation from the programmed orientation characteristic.

The values of the units, tens, hundreds and thousands digits are added. If the thousands digit = 1, the remaining decimals of the MD are not evaluated (with the exception of the ten thousands digit).

21110	X_AXIS_IN_OLD_X_Z_PLANE			EXP, C01, C09	M1, K2	
-	Coordinate system for automatic frame definition			BOOLEAN	NEW CONF	
-						
-	-	TRUE, TRUE, TRUE, TRUE, TRUE, TRUE, TRUE, TRUE...	0	-	7/7	M

Description:

1 = With automatic definition of a frame (TOFRAME), the Z direction of which equals the current tool orientation, the new coordinate system is additionally rotated around the new Z axis so that the new X axis is in the old Z-X plane.

0 = With automatic definition of a frame (TOFRAME), the Z direction of which equals the current tool orientation, the new coordinate system is maintained as it results from the kinematics of the machine, i.e. it is assumed that the coordinate system is fixed to the tool and rotates with the tool (orientation).

From SW 5.3:

2.3 NC machine data

This machine data is only effective when the three lowest value decimal positions (units, tens, hundreds) of SD42980 \$SC_TOFRAME_MODE) equal zero. Otherwise the frame definition is specified by SD42980 \$SC_TOFRAME_MODE.

-								
-	3	.05, .05, .05, .05, .05, .05, .05, .05, .05, .05, .05, .05, .05, .05, .05, ...	0.0	1.0E+301	7/2	M		

Description: Acceleration for orientation axes in the channel

21180	ROT_AX_SWL_CHECK_MODE			C07	F2	
-	Check of software limits for orientation axes			DWORD	NEW CONF	
-						
-	-	0, 0, 0, 0, 0, 0, 0, 0...	0	1112	7/7	U

Description: This machine data is evaluated only with the generic 5-axis transformation.

0x: The orientation axes travel simultaneously to their possible end positions. There may be larger or smaller deviations from the original orientation path.

1x: If possible, the orientation is first rotated in the pole direction. In the pole position, the pole axis is then positioned so that the final orientation can be approached by rotating the orientation from the pole position into the programmed direction. The originally programmed orientation path is then followed.

Meaning of the hundreds digit:

0xx: The range of the non-pole axis is determined by its software limits or working area limitations.

1xx: The range of the non-pole axis is limited either in the positive or negative travel range. The possible range is limited by the larger of the absolute positive and negative values.

Examples:

1. MD36100 \$MA_POS_LIMIT_MINUS[AX5] = -5.0 and MD36110 \$MA_POS_LIMIT_PLUS[AX5] = 135.0, the possible range of axis AX5 is 0 ... 135.0
2. MD36100 \$MA_POS_LIMIT_MINUS[AX5] = -100.0 and MD36110 \$MA_POS_LIMIT_PLUS[AX5] = 10.0, the possible range of axis AX5 is -100.0 ... 0.0
3. MD36100 \$MA_POS_LIMIT_MINUS[AX5] = 5.0 und MD36110 \$MA_POS_LIMIT_PLUS[AX5] = 120.0, the possible range is 5.0 ... 120.0, there is no automatic limitation of the travel range.

Meaning of the thousands digit: Reserved.

21186	TOCARR_ROT_OFFSET_FROM_FR			C01, C07	F2	
-	Offset of TOCARR rotary axes from WO			BOOLEAN	Immediately	
-						
-	-	FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE...	0	-	7/2	M

Description: Rotary axes offset for the orientable tool holder is automatically accepted from the work offset activated on activation of the orientable tool holder for the rotary axes.

21190	TOFF_MODE			C08	F2, 2.4	
-	Mode of correction in tool direction			UDWORD	Reset	
-						
-	-	0, 0, 0, 0, 0, 0, 0, 0...	0	0x7FF	7/2	M

Description: This machine data specifies the online correction mode in tool direction via \$AA_TOFF[].

Bit 0: Behavior of \$AA_TOFF in case of a RESET

0: \$AA_TOFF is deselected on a RESET

1: \$AA_TOFF is retained beyond a RESET

Bit 1: Effect of the value assigned to the 1st component of \$AA_TOFF[]

0: Absolute value

1: Incremental value (integrator)

Bit 2: Effect of the value assigned to the 2nd component of \$AA_TOFF[]

0: Absolute value

1: Incremental value (integrator)

Bit 3: Effect of the value assigned to the 3rd component of \$AA_TOFF[]

0: Absolute value

1: Incremental value (integrator)

Bit 4: Response of \$AA_TOFF motion on NC stop

0: Motion is interrupted on NC stop

1: Motion remains active on NC stop

Bit 5: Response of \$AA_TOFF motion on RESET and end of program

2.3 NC machine data

0: Motion is interrupted on RESET or end of program
 1: Motion remains active on RESET or end of program
 Bit 6: Effect of the setting data \$SC_TOFF_LIMIT_MINUS
 0: The lower limit \$SC_TOFF_LIMIT_MINUS has no effect. -\$SC_TOFF_LIMIT is taken as the lower limit.
 1: The lower limit \$SC_TOFF_LIMIT_MINUS is effective.
 Bit 7: Blockwise suppression of TOFF with SUPA
 0: TOFF is not suppressed block-by-block with SUPA.
 1: TOFF is suppressed block-by-block with SUPA.
 Bit 8: Response of the TOFF handwheel travel at TOFF_LIMIT / TOFF_LIMIT_MINUS
 0: Interruption, that means collection of the distances preset via the handwheel
 1: Abortion of the traversing movement, that means no collection
 Bit 9: \$AA_TOFF handwheel override possible without activation by TOFFON.
 0: \$AA_TOFF handwheel override possible only after activation of the \$AA_TOFF function by TOFFON.
 1: \$AA_TOFF handwheel override possible without activation of the \$AA_TOFF function by TOFFON.
 Bit 10: Axis assignment of the TOFF components on plane change.
 0: The axis components are exchanged cyclically on plane change from G17 to G18 or G19. This means that all three axes of the rotated coordinate system point in the positive axis directions of the initial coordinate system.
 1: The coordinate system is rotated -90 degrees around the X axis on plane change from G17 to G18, and 90 degrees around the Y axis on plane change from G17 to G18.

In both cases, the rotated Z axis points in the same direction as when bit 10 is not set.

The other two axes are exchanged in comparison to the setting with bit 10 not set, and one of the two axes points in the negative direction.

This setting should only be used if compatibility with older software versions is required (SW 4.5 and older). This setting is not recommended for new developments.

21194	TOFF_VELO			C08	F2, 2.4	
mm/min	Feedrate for online correction in tool direction			DOUBLE	NEW CONF	
-

Description: Feedrate for online correction in tool direction [mm/min] via \$AA_TOFF[]

21196	TOFF_ACCEL			C08	2.4	
m/s²	Acceleration for online correction in tool direction			DOUBLE	NEW CONF	
-						
-	3	100., 100., 100., 100., 100., 100., 100., 100., 100., 100., 100....	1.0e-6	1.0E+301	7/2	M

Description: Acceleration for online correction in tool direction [m/s**2] via \$AA_TOFF[]

21198	ORI_TRAFO_ONLINE_CHECK_LIM			C07	F2	
mm	Activation limit of the realtime dynamic monitoring			DOUBLE	NEW CONF	
-						
-	-	1.0, 1.0, 1.0, 1.0, 1.0, 1.0, 1.0, 1.0...	0.0	1.0E+301	7/2	M

Description: If, in the case of an orientation transformation, the effective BCS position or the effective tool length deviates from the values applied in preprocessing by more than the value defined in this machine data (e.g. due to superimposed movement or the activation of online tool length offset), real-time limiting of the dynamic response is activated.

21199	ORI_TRAFO_ONLINE_CHECK_LIMR			C07	F2	
degrees	Activation limit for real-time monitoring of dynamic response, rotary axes			DOUBLE	NEW CONF	
-						
-	-	1.0, 1.0, 1.0, 1.0, 1.0, 1.0, 1.0, 1.0...	0.0	1.0E+301	7/2	M

Description: If, in the case of an orientation transformation, the effective BCS position of one of the rotary axes involved in the transformation deviates from the values applied in preprocessing by more than the value defined in this machine data (e.g. due to superimposed movement), real-time limiting of the dynamic response is activated.

21200	LIFTFAST_DIST			C09	K1, V1, 2.6, 6.1	
mm	Traversing distance on rapid lift from contour			DOUBLE	PowerOn	
-						
-	-	0.1, 0.1, 0.1, 0.1, 0.1, 0.1, 0.1, 0.1...	0.0	1.0E+301	7/2	M

Description: The machine data determines the absolute value of the traverse movement for rapid lift. The direction of the traverse movement is defined in the part program by the command ALF.

References:

/PA/, Programming Guide: Fundamentals

21202	LIFTFAST_WITH_MIRROR			C09	K1	
-	Rapid retract with mirroring			BOOLEAN	PowerOn	
-						
-	-	FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE...	0	-	7/2	M

Description: 1: When determining the retraction direction, if mirroring of the contour is active then the retraction direction is also mirrored. Mirroring of the retraction direction only refers to the directional components vertical to the tool direction.

0: Mirroring of the contour is NOT taken into account when determining the retraction direction.

21203	LIFTFAST_MODE_MASK			C09	K1	
-	Settings for fast retraction			UDWORD	PowerOn	
-						
-	-	0x0, 0x0, 0x0, 0x0, 0x0, 0x0, 0x0, 0x0...	0x0	0x1	7/2	M

Description: Bit0: Behavior of LFWP with active frame
 =0 If the retraction direction is defined with LFWP, the active frame is not effective.
 =1 If the retraction direction is defined with LFWP, the active frame is effective. In this case MD21202 \$MC_LIFTFAST_WITH_MIRROR has no effect.

2.3 NC machine data

21204	LIFTFAST_STOP_COND	C09	M3
-	Stop behavior with fast retraction	UDWORD	NEW CONF
-			
-	-	0, 0, 0, 0, 0, 0, 0, 0...	0 0x7FFFFFFF 7/2 M

Description: Specifies the stop behavior of the liftfast motion under different stop conditions

Bit0: Axial NC/PLC interface signal DB31, ... DBX4.3 (Axial feed stop / Spindle stop) or CP-SW limit stop or a stop by an OEM application

=0 Stop of the retraction motion in case of an axial feed stop or CP-SW limit stop or stop by an OEM application

=1 No stop of the retraction motion in case of an axial feedstop or CP-SW limit stop or stop by an OEM application

Bit1: Feed disable in channel NC/PLC interface signal DB21-30 DBX6.0 (Feed stop)

=0 Stop of the retraction motion in case of a feed stop in the channel

=1 No stop of the retraction motion in case of a feed stop in the channel

21210	SETINT_ASSIGN_FASTIN	C01, C09	-
-	HW assignment of ext. NC input byte for NC progr. interrupts	UDWORD	PowerOn
-			
-	-	1, 1, 1, 1, 1, 1, 1, 1...	0 0x7FFFFFFF 7/2 M

Description: Assignment of input bytes for processing user interrupts in NC programs (SETINT)

Bit 0 ... 7: Number of the input byte (see below)

Bit 16 ... 23: Selection screen for the signals that are NOT evaluated in the channel

Bit 24 to 31: Selection screen for the signals that are evaluated in the channel in INVERTED form

Bit x = 0: Interrupt triggered by rising edge

Bit x = 1: Interrupt triggered by falling edge.

Input bytes:

Byte 1: On-board inputs of the NCU module (DB)

Bytes 2 - 5: External digital inputs (fast NCK I/Os or default via NC/PLC interface)

Bytes 128 - 129: Comparator byte (result from fast analogue inputs or default via NC/PLC interface)

21220	MULTFEED_ASSIGN_FASTIN	C01, C09	A4, V1
-	Assignment of the NC I/Os for 'several feedrates in the block'	UDWORD	PowerOn
-			
-	-	0, 0, 0, 0, 0, 0, 0, 0...	0 0x7FFFFFFF 7/2 M

Description: In MD21220 \$MC_MULTFEED_ASSIGN_FASTIN (assignment of the input bytes of the NC I/Os for "Multiple feeds in one block"), at most two digital input bytes or comparator input bytes of the NC I/Os can be assigned to the input byte for the "Multiple feeds in one block" function.

Furthermore, the assigned input signals can be inverted with the machine data.

The MD is coded as follows:

Bit 0-7:

No. of 1st digital input byte or comparator input byte used

Bit 8 - 15:

No. of 2nd digital input byte or comparator input byte used

Bit 16 - 23:

Inversion mask for describing the 1st byte

Bit 24 - 31:

Inversion mask for describing the 2nd byte

Bit=0: do not invert

Bit=1: invert

The number for the digital inputs should be specified as follows:

1: for the on-board byte

2 - 5: for external bytes

The number for a comparator input byte should be specified as follows:

128: for comparator 1 (corresponds to 80Hex)

129: for comparator 2 (corresponds to 81Hex)

21230	MULTFEED_STORE_MASK	C01, C09	V1
-	Memory response for 'several feedrates in the block'	UBYTE	PowerOn
-			
-	-	0, 0, 0, 0, 0, 0, 0, 0...	0 - 7/2 M

Description:

The priority of the signals for feeds F2 - F7 of the "Multiple feeds in one block" function decreases as the bit number increases in the input byte. The highest priority signal determines the current feed.

The MD21230 \$MC_MULTFEED_STORE_MASK (store input signals of the "Multiple feeds in one block" function) can be used to specify the response when the highest priority input drops out:

Set bit 2 - 7 has the effect that the associated feed (F2 to F7) that has been selected by the highest priority input signal in each case is retained, even if the input signal drops out and a lower priority is present.

The MD is coded as follows:

Bit 0 - 1: No significance

Bit 2 - 7: Storage response of the feed signals

21240	PREVENT_SYNACT_LOCK_CHAN	C01, C09	-
-	Protected synchronized actions	DWORD	PowerOn
-			
-	2	-1, -1, -1, -1, -1, -1, -1, -1 -1, -1, -1, -1, -1, -1, -1, -1 -1, -1...	-1 1399 7/2 M

Description:

The machine data specifies a range of synchronized action IDs.

Synchronized actions with IDs in this range cannot be overwritten, canceled or locked via synchronized actions.

With 0.0, there is no range of protected synchronized actions. The values are read as absolute values; the upper value and the lower value can be indicated in any order.

If a value is configured with -1, the configuration of the general machine data becomes active.

Note:

During the creation of protected static synchronized actions, the protection should be canceled; otherwise, a power ON would be necessary for each change in order to be able to redefine the logic.

21300	COUPLE_AXIS_1	C09	S3
-	Synchron. spindle pair def, mach. axis no: follow. spindle [0], lead.sp [1]	BYTE	PowerOn
-			
-	2	0, 0, 0, 0, 0, 0, 0, 0, 0, 0 0, 0, 0, 0, 0, 0...	0 31 7/2 M

Description:

One pair of synchronous spindles per NC channel can be defined in a fixed configuration with this machine data.

2.3 NC machine data

The machine axis numbers (channel-specific MD20070 \$MC_AXCONF_MACHAX_USED) applicable in the NC channel must be entered for the following spindle [n=0] and the leading spindle [n=1].

The coupling is not regarded as configured if values of "0" are entered, thus leaving 2 couplings to be configured freely via the NC part program.

MD irrelevant for:

User-defined coupling

Related to:

Channel-specific MD21310 \$MC_COUPLING_MODE_1

(type of coupling in synchronous spindle mode)

Channel-specific MD21340 \$MC_COUPLE_IS_WRITE_PROT_1

(coupling parameters cannot be changed)

Channel-specific MD21330 \$MC_COUPLE_RESET_MODE_1

(coupling cancelation response)

Channel-specific MD21320 \$MC_COUPLE_BLOCK_CHANGE_CTRL_1

(block change response in synchronous spindle mode)

SD42300 \$SC_COUPLE_RATIO_1

(speed ratio parameters for synchronous spindle mode)

21310	COUPLING_MODE_1			C03, C09	S3	
-	Type of coupling in synchronous spindle operation			BYTE	PowerOn	
-						
-	-	1, 1, 1, 1, 1, 1, 1, 1...	0	2	7/2	M

Description:

This machine data determines the type of coupling for the fixed coupling configuration defined with machine data COUPLE_AXIS_1[n].

1: Setpoint coupling activated.

With a setpoint coupling, the reference variable for the following spindle is calculated from the position setpoint of the leading spindle, thus allowing the setpoints for the FS and LS to be input simultaneously. This has a particularly positive effect on the spindle synchronism during acceleration and deceleration processes.

A setpoint coupling thus achieves better command behavior than an actual-value coupling.

When a setpoint coupling is used, the following conditions must be fulfilled before synchronous mode is activated:

- The LS must be assigned to the same NC channel as the FS
- The FS and LS must be in position control mode (SPCON)
- The FS and LS must have the same dynamic control response

0: Actual-value coupling activated.

With an actual-value coupling, the command variable for the following spindle is calculated from the actual position value of the leading spindle. With this type of coupling, the following drive must be significantly more dynamic than the leading drive, but never vice versa.

The actual-value coupling can be used, for example, in the following cases:

- The LS must be assigned to a different NC channel than the FS.
- For leading spindles which are not suitable for position control.
- In cases where the dynamic control response of the leading spindle is considerably slower than that of the following spindle. As soon as the actual-value coupling is active, the NC/PLC interface signal DB31, ... DBX98.2 (Actual-value coupling) for the FS is set to "1-signal".

2: Speed coupling activated.

Internally, the speed coupling is a setpoint coupling. Lower dynamic requirements are placed on the FS and LS. A defined relation between the positions of the FS and LS cannot be established.

A speed coupling is used in the following cases:

- LS and/or FS are not in position control.
- There are no measuring systems present.

The coupling type can be altered in the NC part program when the coupling is deactivated by means of language instruction COUPDEF provided this option has not been inhibited by the channel-specific MD21340 \$MC_COUPLE_IS_WRITE_PROT_1. However, the parameterized value of channel-specific MD21310 \$MC_COUPLING_MODE_1 remains unchanged.

MD irrelevant to:

User-defined coupling

Related to:

Channel-specific MD21300 \$MC_COUPLE_AXIS_1

(definition of pair of synchronous spindles)

Channel-specific MD21340 \$MC_COUPLE_IS_WRITE_PROT_1

(write-protection for configured coupling parameters)

NC/PLC interface signal DB31, ... DBX98.2 (Actual-value coupling)

21320	COUPLE_BLOCK_CHANGE_CTRL_1			C09	S3	
-	Block change behavior in synchronous spindle operation			BYTE	PowerOn	
-						
-	-	3, 3, 3, 3, 3, 3, 3...	0	3	7/2	M

Description:

This machine data determines the condition under which a block change has to be executed when synchronous mode is activated for the fixed coupling configuration defined in the channel-specific machine data COUPLE_AXIS_ [n].

The following options are available:

- 0: Block change is enabled immediately
- 1: Block change in response to "Fine synchronization"
- 2: Block change in response to "Coarse synchronization"
- 3: Block change in response to IPOSTOP (i.e. after setpoint-based synchronization)

The block change response can be altered in the NC part program with language instruction COUPDEF provided this option is not inhibited by the channel-specific MD21340 \$MC_COUPLE_IS_WRITE_PROT_1. However, the parameterized value of the channel-specific MD21320 \$MC_COUPLE_BLOCK_CHANGE_CTRL_1 remains unchanged.

The selected block change response remains valid even when the velocity ratio is changed or a defined angular offset is programmed while the coupling is active.

MD irrelevant for:

User-defined coupling

\$MA_COUPLE_VELO_TOL_COARSE

(threshold value for coarse synchronization)

Channel-specific MD37210 \$MA_COUPLE_POS_TOL_FINE or MD37230 \$MA_COUPLE_VELO_TOL_FINE

(threshold value for fine synchronization)

2.3 NC machine data

21330	COUPLE_RESET_MODE_1			C03, C09	S3, K1	
-	Coupling cancelation behavior			UDWORD	PowerOn	
-						
-	-	1, 1, 1, 1, 1, 1, 1, 1...	0	0x3FF	7/2	M

Description:

This machine data defines the behavior of the synchronous mode for the pair of synchronous spindles configured with machine data COUPLE_AXIS_1[n].

Bit 0=0:

Synchronous mode remains active with a new program start and, as long as the control remains switched on, can be canceled only with COUPOF.

Bit 0=1:

Synchronous mode is canceled with program start (from the reset condition).

Bit 1=0:

Synchronous mode remains active even with program end and reset and, as long as the control remains switched on, can be canceled only with COUPOF.

Bit 1=1:

Synchronous mode is canceled with program end or RESET.

Bit 5=1:

The configured data are activated with program start.

Bit 6=1:

The configured data are activated with program end or RESET.

Bit 9=1:

Synchronous mode is switched on with program start.

Note:

Synchronous mode is not deselected with NC Start after NC Stop.

MD irrelevant to:

User-defined coupling

Related to:

Channel-specific MD21300 \$MC_COUPLE_AXIS_1 (definition of pair of synchronous spindles)

NC/PLC interface signal DB31, ... DBX84.4 (Active spindle mode - synchronous mode)

21340	COUPLE_IS_WRITE_PROT_1			C09	S3	
-	Coupling parameters cannot be altered			BOOLEAN	PowerOn	
-						
-	-	FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE...	0	-	7/2	M

Description:

This machine data defines whether or not the coupling parameters (speed ratio, block change response, coupling type) for the pair of synchronous spindles configured with channel-specific machine data COUPLE_AXIS_1[n] may be altered by the NC part program.

1: Coupling parameters may not be altered by the NC program (write-protection active)

An alarm message is generated if an attempt is made to change the parameters.

0: NC part program may alter coupling parameters using language instruction COUPDEF.

MD irrelevant for:

22400	S_VALUES_ACTIVE_AFTER_RESET			C04, C03, C05	-	
-	S function active beyond RESET			BOOLEAN	PowerOn	
-						
-	-	FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE...	0	-	7/2	M

Description:

1: The last S values set in the main run are still active after a RESET.

This also applies to the dynamic correction values ACC, VELOLIM in spindle mode.

0: The various S values are equal to 0 after a RESET, and must therefore be reprogrammed.

The dynamic correction values ACC and VELOLIM are reset to 100% for spindle mode if the axis-specific MD35040 \$MA_SPIND_ACTIVE_AFTER_RESET and MD32320 \$MA_DYN_LIMIT_RESET_MASK do not specify anything else.

Note:

The values for ACC and VELOLIM are also retained for spindle mode if MD35040 \$MA_SPIND_ACTIVE_AFTER_RESET is not equal to zero or the axis-specific MD35040 \$MA_SPIND_ACTIVE_AFTER_RESET is not equal to zero.

22410	F_VALUES_ACTIVE_AFTER_RESET			C04, C03, C05	M3, V1	
-	F function active beyond RESET			BOOLEAN	PowerOn	
-						
-	-	FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE...	0	-	7/2	M

Description:

1: The last programmed F, FA, OVR and OVRA values are still active after RESET.

This also applies to the dynamic correction values (ACC, VELOLIM, JERKLIM, ACCLIMA, VELOLIMA, JERKLIMA).

0: The various values are set to their default values after reset.

This does not apply to the dynamic correction values if the axis-specific MD32320 \$MA_DYN_LIMIT_RESET_MASK specifies anything else.

Note:

2.3 NC machine data

The dynamic correction values are also retained if the axis-specific MD32320 \$MA_DYN_LIMIT_RESET_MASK is not equal to zero.

Related to:

MD22240 \$MC_AUXFU_F_SYNC_TYPE Output time of the F functions

22420	FGROUP_DEFAULT_AXES			C11	-	
-	Default setting for FGROUP command			BYTE	PowerOn	
-						
-	8	0, 0...	-	-	7/7	U

Description: Default setting for FGROUP command. You can specify up to 8 channel axes whose resulting velocity is equivalent to the programmed path feed.
If all eight values are zero (default), the geo axis entered in MD20050 \$MC_AXCONF_GEOAX_ASSIGN_TAB are active as the default setting for the FGROUP command as previously.

22430	FGROUP_PATH_MODE			EXP	-	
-	Response of the path velocity in singular situations			BYTE	Immediately	
-						
-	-	1, 1, 1, 1, 1, 1, 1, 1...	0	3	3/3	U

Description: If the path of the FGROUP axes is short in comparison to that of the non-FGROUP axes, the latter must become very fast in order to follow the path. If the path is precisely 0, then they travel instead at the programmed feedrate. The machine data can be used to soften this abrupt transition.

Value 0: This abrupt transition is not processed. Setting compatible with the behavior before the software release 6

Value 1: From a threshold of the path relationship of MD22440 \$MC_FGROUP_PATH_RATIO, the paths of the non-FGROUP axes are increasingly taken into account. However, this is only applicable in polynomial blocks with significantly changing path components. Setting compatible with the behavior before software release NCK.P7_91

Value 2: As for 1, however, without the restrictions.

Value 3: As for 2, but with improved behavior if there are no geometry axes in the FGROUP. Recommended setting for mold building applications and special machines.

.

Related to:

MD22420 \$MC_FGROUP_DEFAULT_AXES, MD22440 \$MC_FGROUP_PATH_RATIO

22440	FGROUP_PATH_RATIO			EXP	-	
-	Path ratio when using the FGROUP singularity strategy			DOUBLE	Immediately	
-						
-	-	1.0, 1.0, 1.0, 1.0, 1.0, 1.0, 1.0, 1.0...	0.	1.e6	3/3	U

Description: Ratio of the path of non-FGROUP axes to the FGROUP axes, from which also the path of the first is taken into account for the reference of the path velocity.

Is only of significance for MD22430 \$MC_FGROUP_PATH_MODE > 0. A value of 0 has the same effect as if all axes were in the FGROUP. For larger values, this approaches the behavior of that of MDMD22430 \$MC_FGROUP_PATH_MODE = 0.

Corresponds with:

MD22420 \$MC_FGROUP_DEFAULT_AXES, MD22430 \$MC_FGROUP_PATH_MODE

Description:	The data specifies how the velocities of the geometry axes are limited for technology groups by curvatures. Value 0: The limitation results from the axial accelerations of the geometry axes involved in the path. Value 1: The limitation results from the geometric curvatures of the geometry axes involved in the path. Setting 0 leads to a higher path velocity, because traversing can then be faster in the diagonal direction. With setting 1, the path velocity is equally limited at points with diagonal and paraxial tangents. The course of the path velocity is then smoother. This setting should therefore be selected for finishing. The setting affects the limitations of the path velocity on account of the contour accuracy function (G code CPRECON), the maximum axis acceleration (MD32300 \$MA_MAX_AX_ACCEL) and the chord error caused by the interpolation cycle (MD10682 \$MNC CONTOUR SAMPLING FACTOR).
---------------------	--

Description:	Specification of the G code group, the G codes of which are output to the NCK/PLC interface in case of block change/ reset. The interface is updated after each block change and reset. Notice: It is not guaranteed that a PLC user program has at all times a block-synchronous relation between the active NC block and the G codes present. Example: Path mode with very short blocks
---------------------	--

Description:	Specification of the G code group of external languages, the G codes of which are output at the NCK interface on block change/reset. The interface is updated at each block change and after RESET. Notice: It is not guaranteed that a PLC user program has at all times a block-synchronous relation between the active NC block and the G codes present. (Example: Path mode with very short blocks).

22515	GCODE_GROUPS_TO_PLC_MODE	C04	-
-	Behavior of G group transfer to PLC	UDWORD	PowerOn
-			
-	-	0, 0, 0, 0, 0, 0, 0, 0...	0 0x1 7/2 M

Description:

For setting the behavior, i.e. how the G groups are to be interpreted in the PLC with regard to data.

With the current behavior (bit 0 = 0), the G group is the array index of a 64-byte field (DBB 208 - DBB 271).

Maximally the 64th G group can be reached in this way.

With the new behavior (bit 0 = 1), the data storage in the PLC consists of max. 8 bytes (DBB 208 - DBB 215).

With this procedure, the array index of this byte array is identical with the index of the MD22510 \$MC_GCODE_GROUPS_TO_PLC[Index] and MD22512 \$MC_EXTERN_GCODE_GROUPS_TO_PLC[Index].

Each index (0 - 7) may only be set for one of the two machine data; the value 0 must be entered for the other MD.

Bit 0 (LSB) = 0:

Behavior as before, the 64-byte field is used for displaying the G codes

Bit 0 (LSB) = 1:

The user specifies for which G groups the first 8 bytes are to be used

22530	TOCARR_CHANGE_M_CODE	C04	H2, W1
-	M code at change of tool holder	DWORD	PowerOn
-			
-	-	0, 0, 0, 0, 0, 0, 0, 0...	-99999999 99999999 7/2 M

Description:

The absolute value of this machine data indicates the number of the M code, which is output at the VDI interface when a tool holder is activated.

- If the MD is positive, the unchanged M code is always output.
- If the MD is negative, the number of the tool holder is added to the absolute value of the machine data and the number is output.

Special cases:

N M code is output, if the number of the M code to be output or the absolute value of this MD is set to one of the values 0 to 6, 17 or 30. It is not monitored whether an M code created in this way will conflict with other functions.

References:

/FB/, H2, Auxiliary Function Output to PLC

22532	GEOAX_CHANGE_M_CODE	C04	H2, K2
-	M code at change of geo axes	DWORD	PowerOn
-			
-	-	0, 0, 0, 0, 0, 0, 0, 0...	0 99999999 7/2 M

Description:

Number of the M code, which is output at the VDI interface in the case of a switchover of the geometry axes.

No M code is output if this MD is set to one of the values 0 to 6, 17 or 30.

It is not monitored whether an M code created in this way will conflict with other functions.

22534	TRAFO_CHANGE_M_CODE	C04	M1, H2
-	M code at change of transformation	DWORD	PowerOn
-			
-	-	0, 0, 0, 0, 0, 0, 0, 0...	0 99999999 7/2 M

Description: Number of the M code that is output at the VDI interface in the case of a transformation changeover of the geometry axes.

No M code is output if this MD is set to one of the values 0 to 6, 17 or 30.

It is not monitored whether an M code created in this way will conflict with other functions.

22550	TOOL_CHANGE_MODE	C01, C11, C04, C09	W3, K1, W1
-	New tool compensation for M function	BYTE	PowerOn
-			
-	-	0, 0, 0, 0, 0, 0, 0, 0...	0 1 7/2 M

Description: The T function is used to select a tool in the program. The setting in this machine data determines whether the new tool is loaded immediately on execution of the T function:

MD22550 \$MC_TOOL_CHANGE_MODE = 0

The new tool is loaded directly with the programming of T or D. This setting is mainly used on turning machines. If a D is not programmed in the block by T, then the tool offset defined in MD20270 \$MC_CUTTING_EDGE_DEFAULT is active.

In this case, the function "Manual tools" is not enabled.

MD22550 \$MC_TOOL_CHANGE_MODE = 1

The new tool is prepared for loading on execution of the T function. This setting is used mainly on milling machines with a tool magazine in order to bring the new tool into the tool change position without interrupting the machining process. The M function entered in MD22560 \$MC_TOOL_CHANGE_M_CODE is used to remove the old tool from the spindle and load the new tool onto the spindle. According to DIN 66025, this tool change has to be programmed with M function M06.

Related to:

MD22560 \$MC_TOOL_CHANGE_M_CODE

22560	TOOL_CHANGE_M_CODE	C01, C04, C09	H2, K1, W1
-	M function for tool change	DWORD	PowerOn
-			
-	-	6, 6, 6, 6, 6, 6, 6, 6...	6 99999999 7/2 M

Description: If the T function is only used to prepare a new tool for a tool change (this setting is used mainly on milling machines with a tool magazine, in order to bring the new tool into the tool change position without interrupting the machining process), another M function must be used to trigger the tool change.

The M function entered in TOOL_CHANGE_M_CODE triggers the tool change (remove old tool from the spindle and load new tool into the spindle). This tool change is required to be programmed with M function M06, in accordance with DIN 66025.

2.3 NC machine data

Description:

Behavior if faults/problems occur during programmed tool change.

Bit 0=0: Standard behavior: Stop at the faulty NC block

Bit 0=1: If a fault is detected in the block with the tool change preparation, the alarm relevant to the preparation command T is delayed until the corresponding tool change command (M06) has been interpreted in the program sequence. Until then, the alarm triggered by the preparation command is not output. The operator can take corrective actions in this block. When the program continues, the faulty NC block is re-interpreted, and the preparation command is automatically executed again internally.

The value = 1 is relevant only if the setting MD22550 \$MC_TOOL_CHANGE_MODE = 1 is used.

Bit 1 Only relevant with active tool management.

Bit 1=0: Standard behavior: Only tools with data assigned to a magazine are detected during tool change preparation.

Bit 1=1: Manual tools can be loaded.

A tool will also be loaded if its data is known in the NCK but has not been assigned to a magazine. In this case, the tool data is automatically assigned to the programmed toolholder.

The user is prompted to insert tools into or remove tools from the toolholder.

Bit 2 qualifies the offset programming

Bit 2=0: active D no. > 0 and active T no.=0 gives offset 0

Active D no. > 0 and active D no.=0 gives total offset 0

Bit 2=1: active D no. > 0 and active T no.=0 lead to an alarm message

Active D no. > 0 and active D no.=0 lead to an alarm message

Bits 3 and 4 are only relevant with active tool management.

Function:

Control of the behavior of the init. block generation on program start if an unserviceable tool is on the spindle and this tool is to be activated.

See also: MD20112 \$MC_START_MODE_MASK, MD20110 \$MC_RESET_MODE_MASK

On RESET, this does not affect the behavior "Keep disabled tool on the spindle active".

Bit 3=0: Standard: If the tool on the spindle is unserviceable, generate a tool change command requesting a replacement tool. An alarm will be generated if there is no such replacement tool.

Bit 3=1: The status of the unserviceable spindle tool is ignored. (Exception: disabled tools.) The tool becomes active. The subsequent part program should be formulated so that no parts are machined with the unserviceable tool.

Bit 4=0: Standard: The system tries to activate the spindle tool or its replacement tool

Bit 4=1: If the tool on the spindle is unserviceable, T0 is programmed in the start init block.

The combination of bits 3 and 4 produces the following statements:

0 / 0: Behavior as before, automatic change on NC start if an unserviceable tool is in the spindle

1 / 0: Is not always automatically changed

0 / 1: A T0 is automatically generated if an unserviceable tool is in the spindle at NC start

1 / 1: No statement

Bit 5: Reserved

Bit 6=0: Standard: If T0 or D0, only T0 or D0 is exactly programmed.

This means that MD20270 \$MC_CUTTING_EDGE_DEFAULT and MD20272 \$MC_SUMCORR_DEFAULT define, with the programming of T0 the value of D, DL.

For example, MD20270 \$MC_CUTTING_EDGE_DEFAULT=1

MD20272 \$MC_SUMCORR_DEFAULT=2

MD22550 \$MC_TOOL_CHANGE_MODE=0 (tool change with T programming)

N10 T0; T no. 0 has active number D1 and DL=2 which results in offset zero. If bit 2 is also set:

Programming of

- a) T0; for tool deselection
- b) D0; for offset deselection

generates an alarm, if at least one of the machine data

MD20270 \$MC_CUTTING_EDGE_DEFAULT

MD20272 \$MC_SUMCORR_DEFAULT

is not equal to zero (T0 D0 DL=0 is the correct programming).

or MD20272 \$MC_SUMCORR_DEFAULT is not equal to zero (D0 DL=0 is the correct programming).

Bit 6=1: controls the NCK response when programming (x, y, z all greater than zero), if at least one of

MD20270 \$MC_CUTTING_EDGE_DEFAULT

MD20272 \$MC_SUMCORR_DEFAULT

is not equal to zero.

a) Tx Dy -> T0

T0 is automatically programmed in NCK D0 or D0 DL=0; i.e. values not equal to zero of MD20270 \$MC_CUTTING_EDGE_DEFAULT, MD20272 \$MC_SUMCORR_DEFAULT are treated as value equal to zero.

b) Tx Dy -> T0 Dy, or T0 DL=z, or T0 Dy DL=z, or T0 D0 DL=z explicitly programmed values of D, DL are not influenced.

c) Dy DL=z -> D0

With D0, DL=0 is automatically programmed in the NCK; i.e. values in MD20272 \$MC_SUMCORR_DEFAULT unequal to zero are treated as values equal to zero.

d) Dy DL=z -> D0 DL=z

Explicitly programmed values of DL are not influenced.

If bit 2 is also set:

Only T0 / D0 have to be programmed for tool/offset deselection, and this does not generate an alarm.

The statements relating to MD20272 \$MC_SUMCORR_DEFAULT or DL are only valid if the total offset function is active

(see MD18080 \$MN_MM_TOOL_MANAGEMENT_MASK, bit 8).

Bit 7=0: When Tx is programmed, a check is made to see whether a tool with T number x is known in the T0 unit of the channel. If not, the program is stopped in this block with alarm 17190.

Bit 7=1: only if the tool basic functionality is active

(MD20310 \$MC_TOOL_MANAGEMENT_MASK, bit 0,1=0)

and (MD18102 \$MN_MM_TYPE_OF_CUTTING_EDGE=0):

When Tx is programmed, an unknown Tx is initially ignored, and the alarm relating to the preparation command (Tx) is also ignored until the D selection is interpreted in the program sequence. Only then is alarm 17191, which has been triggered by the preparation command, output. This means that the operator can take corrective actions with the D selection in this block. When the program is continued, the incorrect NC block is re-interpreted, and the preparation command is automatically executed again internally.

(This is of interest for Cutting-Edge-Default=0 or =-2 and D0 programming, otherwise the D of Cutting-Edge-Default is deselected on tool change.)

This variant is justified for programming "Tool number=Location" (turret as toolholder) without tool management. The turret can now be positioned on a location for which a tool has not (yet) been defined.

This bit has no meaning if bit 0=1 is set.

2.3 NC machine data

Bit 8=0: A tool that is located at a blocked magazine location is not taken into account when selecting a tool. (default setting)

Bit 8=1: Even a tool that is located at a blocked magazine location is taken into account when selecting a tool (this corresponds to the previous behavior.)

Bit 9=0: The tool status "to unload" (\$TC_TP8[T_No] bit10=1) has no meaning. (default setting)

Bit 9=1: A tool with the status "to unload" (\$TC_TP8[T_No] bit10=1) is not selected in T programming.

Bit 9=1: If a multitool or one of the tools on the multitool has the status "to unload" (\$TC_MTP8[MT_No] or \$TC_TP8[T_No] Bit10=1)

the tools on the multitool are not selected in T programming.

22600	SERUPRO_SPEED_MODE			EXP	K1	
-	Speed for block search run type 5			DWORD	Immediately	
-						
-	-	1, 1, 1, 1, 1, 1, 1...	0	3	2/2	M

Description:

This machine data specifies the search run mode: SERUPRO in more detail.

SERUPRO search run is activated with PI service _N_FINDBL mode parameter = 5.

SERUPRO means Search Run by Program test, i.e. traversing under program test from beginning of program to search target.

Note:

Program test does not move any axes/spindles.

MD22600 \$MC_SERUPRO_SPEED_MODE= 0

Program test with the search run/dry run speed

Under program test, the axes/spindles are traversed at the following velocity/speed:

Axes: MD22601 \$MC_SERUPRO_SPEED_FACTOR*dry run feed

Spindles: MD22601 \$MC_SERUPRO_SPEED_FACTOR*programmed speed

Dynamic axis / spindle limitations are not taken into account.

MD22600 \$MC_SERUPRO_SPEED_MODE= 1

Program test at programmed speed

Under program test, the axes/spindles are traversed at the following velocity/speed:

Axes: at the same velocity as dry run feed.

Spindles: at the programmed speed.

Dynamic axis / spindle limitations are taken into account.

MD22600 \$MC_SERUPRO_SPEED_MODE= 2

Program test at dry run speed

Under program test, the axes/spindles are traversed at the programmed velocity/speed.

Dynamic axis /spindle limitations are taken into account.

MD22600 \$MC_SERUPRO_SPEED_MODE= 3

Program test at search run speed

Under program test, the axes/spindles are traversed at the following velocity/speed:

Axes: MD22601 \$MC_SERUPRO_SPEED_FACTOR*programmed feed

Spindles: MD22601 \$MC_SERUPRO_SPEED_FACTOR*programmed speed.

Dynamic axis / spindle limitations are not taken into account.

Note:

With active revolutional feedrate (e.g. G95), the programmed F value is not multiplied by the factor MD22601 \$MC_SERUPRO_SPEED_FACTOR but only by the programmed spindle speed. Here again, this increases the effective path velocity by the MD22601 \$MC_SERUPRO_SPEED_FACTOR.

Related to:

SD42100 \$SC_DRY_RUN_FEED, MD22601 \$MC_SERUPRO_SPEED_FACTOR

22601	SERUPRO_SPEED_FACTOR				EXP	K1	
-	Speed factor for search run type 5				DOUBLE	Immediately	
-							
-	-	10.0, 10.0, 10.0, 10.0, 10.0, 10.0, 10.0, 10.0...	1.0	1.0E+301	2/2	M	

Description: SERUPRO means Search Run by Program test, i.e. traversing under program test from beginning of program to search target.

Note:

Program test does not move any axes / spindles.

The machine data is relevant only if the first two bits of MD22600

\$MC_SERUPRO_SPEED_MODE are 0. The machine data has the following meaning:

Axes: MD specifies the factor by which the test run feedrate is multiplied.

Spindles: MD specifies the factor by which the programmed speed is multiplied.

Dynamic limitations of axes / spindles are always ignored.

Related to:

SD42100 \$SC_DRY_RUN_FEED, MD22600 \$MC_SERUPRO_SPEED_MODE

22620	START_MODE_MASK_PRT			EXP, C03	M3, K1	
-	Initial setting on special starts			UDWORD	Reset	
-						
-	-	0x400, 0x400, 0x400, 0x400, 0x400, 0x400, 0x400, 0x400...	0	0xFFFF	7/2	M

Description: This machine data is activated via MD22621 \$MC_ENABLE_START_MODE_MASK_PRT.
If MD22621 \$MC_ENABLE_START_MODE_MASK_PRT is in its initial setting, MD22620 \$MC_START_MODE_MASK_PRT is inactive.
If MD22620 \$MC_START_MODE_MASK_PRT is activated for "search via program test" (abbr. SERUPRO), then MD22620 \$MC_START_MODE_MASK_PRT replaces MD20112 \$MC_START_MODE_MASK when "search via program test" is started.
This enables a behavior deviating from PLC start to be set at the start of the search. The meaning of the bit-by-bit assignment of MD22620 \$MC_START_MODE_MASK_PRT is the same as that in MD20112 \$MC_START_MODE_MASK.

22621	ENABLE_START_MODE_MASK_PRT			EXP, C03	M3, K1	
-	Enables MD22620 \$MC_START_MODE_MASK_PRT			UDWORD	Reset	
-						
-	-	0x0, 0x0, 0x0, 0x0, 0x0, 0x0, 0x0, 0x0...	0	0x1	7/2	M

Description: MD22620 \$MC_START_MODE_MASK_PRT is activated via MD22621 \$MC_ENABLE_START_MODE_MASK_PRT.
If MD22621 \$MC_ENABLE_START_MODE_MASK_PRT is in its initial setting, MD22620 \$MC_START_MODE_MASK_PRT is inactive.
Bit0 = 1:
If a "search via program test" (English abbr. SERUPRO) is started from RESET (PI service _N_FINDBL mode parameter == 5), MD22620 \$MC_START_MODE_MASK_PRT replaces MD20112 \$MC_START_MODE_MASK.
This method can be used to set a start behavior differing from PLC start when the search is started.

Description:	Allow part program start via PLC. This machine data will ONLY be evaluated, if "Group-Serupro" mode is switched on. "Group-Serupro" is switched on by means of "\$MC_SERUPRO_MODE BIT2". BIT0 = 0 A part program can be started in this channel only via the PLC. Starting via the part program command "START" is interlocked. BIT0 = 1 A part program can be started in this channel only by means of the part program command "START" from another channel. Starting via the PLC is interlocked.
---------------------	--

Description:	With MD22680 \$MCM_AUTO_IPTR_LOCK program areas are defined in which the individually indicated coupling types are active. If a program cancelation is executed in a program range that is defined as such, it will not be the currently executed part program block that is stored in the interrupt pointer (OPI module InterruptionSearch),but the last block prior to activation of the coupling.
---------------------	--

Description:	The machine data is intended for diagnostics. The recording of the diagnostic data does not start until the event (TRACE_STARTTRACE_EVENT) has occurred at the trace point (TRACE_STARTTRACE_TRACEPOINT) and in the correct step (TRACE_STARTTRACE_STEP)! The machine data is additionally activated using the Cancel alarm key.
---------------------	---

Description:	The machine data is only intended for diagnostic use. See TRACE_STARTTRACE_EVENT For TRACE_STARTTRACE_EVENT BLOCK_CHANGE the string TRACE_STARTTRACE_STEP is interpreted as a file name and block number! For BSEVENTTYPE_SETALARM the string is interpreted as an alarm number. The machine data can be additionally activated using the Cancel alarm key.
---------------------	--

Description:	The machine data is only intended for diagnostics. The recording of the diagnostic data ends when the event (TRACE_STOPTRACE_EVENT) has occurred at the trace point (TRACE_STOPTRACE_TRACEPOINT) and in the correct step (TRACE_STOPTRACE_STEP)! After reaching the stop condition, the previously recorded diagnostic data is stored in a file "NCSCTRyy.MPF" or for NCU-LINK in "NCxxTRYy.MPF" in the MPF directory. The machine data is additionally activated using the Cancel alarm key.
---------------------	---

Description:	The machine data is only intended for diagnostics. The machine data can be additionally activated using the Cancel alarm key.
---------------------	---

Description:	The machine data is only intended for diagnostics purposes. Specific trace contents are selected with the MD data. The entry SETALARM records the alarm environment and the block change in the main run is also logged by means of BLOCK_CHANGE. The machine data is additionally activated using the Cancel alarm key.
---------------------	--

Description:	The machine data is only intended for diagnostic purposes. The MD datum defines which data are recorded in the trace file.
---------------------	---

Machine data and parameters
List Manual, 12/2019, 6FC5397-7AP40-6BA3

2.3 NC machine data

Description: The machine data is only intended for diagnostic use.
 The MD data, together with TRACE_VARIABLE_NAME, determines which data are recorded in the trace file.
 It enables access to an array element.
 E.g. use as an axis index when accessing axis data.

22714	MM_TRACE_DATA_FUNCTION			EXP, C02, C06	-	
-	Activating diagnostics			UDWORD	PowerOn	
NBUP						
-	-	0x0, 0x0, 0x0, 0x0, 0x0, 0x0, 0x0, 0x0...	0	0x1FFFFFFF	2/2	M

Description: The machine data is only intended for diagnostics purposes.
 Activating diagnostics
 An internal ring buffer records important events.
 After a trigger event, the 'Cancel alarm' key is set as default,
 the ring buffer is briefly frozen, read, and converted into an ASCII file
 in the part program directory. The file name for the 1st channel
 is ncsctr01.mpf and for the 7th channel it is ncsctr07.mpf.
 The data in the ring buffer is referred to as dynamic data in the following.
 In addition to the trigger event, other up-to-date data is read from the
 NCK and transferred to the ASCII file. These recordings do
 NOT have a history and are referred to as static data in the following.
 Bit no. Significance when bit is set

 0 (LSB) Recording of dynamic data (see TRACE_VARIABLE_NAME)
 1 Recording of block control static data
 2 Recording of alarm data static data
 3 Recording of process data static data
 4 Recording of command sequence static data
 5 Recording of tool management static data
 6 Recording of the NCK version file. Static data
 7 Recording of the states of the current block
 Various states of the axes and the SPARPI. Static data
 8 Recording of various states of the channel. Static data
 9 Error states in the NCK memory management are scanned during trace generation.
 An error renames the trace file. Static data
 Possible names and their meanings:
 NCFIER.MPF Error in the file system
 NCSLER.MPF Error during string creation
 NCFIER.MPF Error on New/Delete
 10 All block changes in the interpreter are recorded. Dynamic data.
 11 Axial VDI signals are recorded. Dynamic data.
 Only in conjunction with MD18794 \$MN_MM_TRACE_VDI_SIGNAL
 12 OEM traces are activated. Dynamic data.
 13 Synchronized actions are recorded. Dynamic data.
 NOTICE: Filled in applications with intensive use of
 these trace points, other events are ignored!
 That is why this bit should remain at 0 in these cases.
 14 Reserved.

- 15 Recording of station commands. Dynamic data.
Note: Most important output of the NCK module NCSC!
- 16 Recording of gantry commands
- 17 Recording of changes in the drive's status
- 18 Recording of the processing of the Event-Queue and generation of command sequences
- 19 Recording of time of event destructor calls
- 20 Recording of the dynamic limitations per block (only active when bit 0 is set).
- 21 Recording of the Look Ahead data and events for collision avoidance (only active when bit 0 is set).
- 22 Recording of all Functions Config data.
Both a static part as well as a block-related part with the dynamic block data are output at the time of trace generation.
- 22 Config data output (static)
- 23 Recording if computing time is given away during preprocessing (only active when bit 0 is set).
- 24 Recording of multi-threading sequences (Multicore).
- 25 Recording of the external communication.
- 26 Recording of geometry data: positions, vLim, vLimSafety, OVR, clamping, etc.
- 27 Program trace: Extension of bit 10 to include recording of NC blocks in a representation based on the basic block display with the prefix ID ":PT:"
- 28 Output of performance data in the static and, if bit 0 is set, in the dynamic part, with corresponding trace configuration

22900	STROKE_CHECK_INSIDE			EXP, C01, C11	-	
-	Direction (inside/outside) in which prot. zone 3 is effective			BOOLEAN	PowerOn	
-						
-	-	FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE...	0	-	7/2	M

Description: This MD defines whether protection zone 3 is a protection zone inside or outside.

Meaning:

0: Protection zone 3 is a protection zone inside, i.e. the protection zone must not entered inwardly.

1: Protection zone 3 is a protection zone outside

22910	WEIGHTING_FACTOR_FOR_SCALE			EXP, C01, C11	-	
-	Input resolution for scaling factor			BOOLEAN	PowerOn	
-						
-	-	FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE...	0	-	7/2	M

Description: Definition of the unit for the scaling factor P and for the axial scaling factors I, J, K.

Meaning:

0 Scale factor in 0.001

1 Scale factor in 0.00001

Related to:

SD43120 \$SA_DEFAULT_SCALE_FACTOR_AXIS,

SD42140 \$SC_DEFAULT_SCALE_FACTOR_P

2.3 NC machine data

22914	AXES_SCALE_ENABLE			EXP, C01, C11	-	
-	Activation for axial scaling factor (G51)			BOOLEAN	PowerOn	
-						
-	-	FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE...	0	-	7/2	M

Description: This MD enables axial scaling.
Meaning:
0: Axial scaling not possible
1: Axial scaling possible -> MD DEFAULT_SCALE_FACTOR_AXIS is active
Related to:
SD43120 \$SA_DEFAULT_SCALE_FACTOR_AXIS

22920	EXTERN_FIXED_FEEDRATE_F1_ON			EXP, C01, C11	-	
-	Activation of fixed feedrates F1 - F9			BOOLEAN	PowerOn	
-						
-	-	FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE...	0	-	7/2	M

Description: This MD is used to activate the fixed feedrates set in SD42160
\$SC_EXTERN_FIXED_FEEDRATE_F1_F9[].
Meaning:
0: no fixed feedrates with F1 - F9
1: the feedrates set in SD42160 \$SC_EXTERN_FIXED_FEEDRATE_F1_F9[] become active
when F1 - F9 are programmed.

22930	EXTERN_PARALLEL_GEOAX			EXP, C01, C11	-	
-	Assignment of a parallel channel axis to the geometry axis			BYTE	PowerOn	
-						
-	3	0, 0...	0	20	7/2	M

Description: Assignment table of the axes positioned parallel to the geometry axes.
This table can be used to assign channel axes positioned parallel to the geometry axes. The parallel axes can then be activated as geometry axes in ISO mode using the G functions of plane selection (G17 - G19) and the axis name of the parallel axis.
The axis is then replaced by the axis defined via MD20050
\$MC_AXCONF_GEOAX_ASSIGN_TAB[].
Prerequisite:
The channel axes used must be active. (list position assigned in
AXCONF_MACHAX_USED). Entering zero deactivates the corresponding parallel geometry axis:

24000	FRAME_ADD_COMPONENTS			C03	K2	
-	Frame components for G58 and G59			BOOLEAN	PowerOn	
-						
-	-	FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE. FALSE...	0	-	7/7	U

Description: Additive programmable frame components can be separately programmed and modified.

0: Additive translations which have been programmed with ATRANS are stored in the frame together with the absolute translation (prog. with TRANS).
G58 and G59 are not possible.

1: The sum of the additive translations are stored in the fine offset of the programmable frame. The absolute and the additive translations can be changed independently of one another.
G58 and G59 are possible.

24002	CHBFRAME_RESET_MASK			C03	K2	
-	Active channel-specific base frames after reset			UDWORD	Reset	
-						
-	-	0xFFFF, 0xFFFF, 0xFFFF, 0xFFFF, 0xFFFF, 0xFFFF, 0xFFFF, 0xFFFF...	0	0xFFFF	7/2	M

Description: Bit mask for the reset setting of the channel-specific base frames which are included in the channel.

The following apply:

If MD20110 \$MC_RESET_MODE_MASK bit0 = 1 and BIT14 = 1
the entire base frame is determined on reset by chaining the base frame field elements, whose bit is 1 in the bit mask.

If MD20110 \$MC_RESET_MODE_MASK bit0 = 1 and BIT14 = 0
the entire base frame is deselected on reset.

24004	CHBFRAME_POWERON_MASK			C03	K2	
-	Reset channel-specific base frames after power on			UDWORD	PowerOn	
-						
-	-	0x0, 0x0, 0x0, 0x0, 0x0, 0x0, 0x0, 0x0...	0	0xFFFF	7/2	M

Description: This machine data defines whether channel-specific base frames are reset in the data management on Power On.

That is

- Offsets and rotations are set to 0,
- Scalings are set to 1.
- Mirror image machining is disabled.

The selection can be made separately for individual base frames.
Bit 0 means base frame 0, bit 1 base frame 1 etc.

Value=0: Base frame is retained on Power On
Value=1: Base frame is reset in the data management on Power On.

-	-	0x0, 0x0, 0x0, 0x0, 0x0, 0x0, 0x0, 0x0...	0 0x0000007 7/2 M

Description: Bit mask for adapting the active frames for axis configuration
 The following applies:
 Bit 0:
 Rotations in active frames that rotate coordinate axes for which there are no geometry axes are deleted from the active frames.
 Bit 1:
 Shear angles in active frames are orthogonalized.
 Bit 2:
 Scalings of all geometry axes in the active frames are set to value 1.

2.3 NC machine data

24050	FRAME_SAA_MODE			C03	-	
-	Saving and activating of data management frames			UDWORD	PowerOn	
-						
-	-	0x0, 0x0, 0x0, 0x0, 0x0, 0x0, 0x0, 0x0...	0	0x0000003	7/2	M

Description: Bit mask for saving and activating data management frames.
The following applies:
Bit 0:
Data management frames are only activated by programming the bit masks \$P_CHBFRMASK, \$P_NCBFRMASK and \$P_CHSFRMASK. G500..G599 only activate the relevant settable frame, GFRAME0..GFRAME100 only activate the corresponding grinding frame. The reset behavior is independent of this.
Bit 1:
Data handling frames are not written implicitly by system functions such as TOROT, PAROT, ext. work offset, transformations.

24080	USER_FRAME_POWERON_MASK			N01	-	
-	Parameterize properties for settable frame			UDWORD	PowerOn	
-						
-	-	0x0, 0x0, 0x0, 0x0, 0x0, 0x0, 0x0, 0x0...	0	0x1	7/2	M

Description: Setting the following bits activates certain properties of the settable frame:
Bit 0 = 0: default behavior.
Bit 0 = 1: if MD20152 \$MC_GCODE_RESET_MODE[7] = 1, the last active settable frame is selected again according to G code group 8 after power up of the control.

24100	TRAFO_TYPE_1			C07	F2, TE4, M1, K1, W1	
-	Definition of transformation 1 in channel			DWORD	NEW CONF	
-						
-	-	0, 0, 0, 0, 0, 0, 0, 0...	-	-	7/7	U

Description: This MD specifies the first available transformation in each channel.
The 4 low-value bits identify the specific transformation of a specific transformation group. The transformation group is identified by a number starting with the 5th bit.
Meaning:
0 No transformation
ab 16
5-axis transformation with turnable tool
ab 32
5-axis transformation with turnable workpiece
ab 48
5-axis transformation with turnable tool and turnable workpiece
72
Generic 5-axis transformation. Type and kinematic data are determined by an associated, orientable toolholder.
see:
MD24582 \$MC_TRAFO5_TCARR_NO_1
MD24682 \$MC_TRAFO5_TCARR_NO_2
The 4 low-value bits have the following meaning for a 5-axis transformation:
0 axis sequence AB

1 axis sequence AC
 2 axis sequence BA
 3 axis sequence BC
 4 axis sequence CA
 5 axis sequence CB
 8 Generic orientation transformation (3- 5 axes)
 ab 256
 TRANSMIT transformation
 ab 512
 TRACYL transformation
 ab 1024
 TRAANG transformation
 2048
 TRACLG: centerless transformation
 ab 4096 bis 4098
 OEM transformation
 ab 8192
 TRACON: cascaded transformations
 Example:
 A 5-axis transformation with turnable tool and axis sequence CA (i.e. C axis turns A axis) has number 20 (= 16 + 4)
 Notice:
 Not all combinations of group numbers and axis sequence numbers are allowed. An error message is output if a number for a non-existent transformation is entered.
 Corresponds with:
 MD24200 \$MC_TRAFO_TYPE_2, MD24300 \$MC_TRAFO_TYPE_3, ... MD24460 \$MC_TRAFO_TYPE_8

-	3	0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0,...	-MD_DBLMAX	1.0E+301	7/7	U

Description: This machine data designates the angular offset of the first or second rotary axis in degrees for the first 5-axis transformation of a channel.

MD irrelevant:

if the "5-Axis Transformation" option is not installed.

24520	TRAFO5_ROT_SIGN_IS_PLUS_1			C07	F2, M1	
-	Sign of rotary axis 1/2/3 for 5-axis transformation 1			BOOLEAN	NEW CONF	
-						
-	3	TRUE, TRUE, TRUE, TRUE, TRUE, TRUE, TRUE, TRUE, TRUE, TRUE, TRUE...	0	-	7/7	U

Description: This machine data designates the sign with which the two rotary axes are included in the first 5-axis transformation of a channel.

MD = 0 (FALSE):

Sign is reversed.

MD = 1 (TRUE) :

Sign is not reversed and the traversing direction is defined according to MD32100 \$MA_AX_MOTION_DIR.

This machine data does not mean that the rotational direction of the rotary axis concerned is to be reversed, but specifies whether its motion is in the mathematically positive or negative direction when the axis is moving in the positive direction.

The result of a change to this machine data is not therefore a change in the rotational direction, but a change in the compensatory motion of the linear axes.

However, if a directional vector and thus, implicitly, a compensatory motion is specified, the result is a change in the rotational direction of the rotary axis concerned.

On a real machine, therefore, the machine data may be set to FALSE (or zero) only if the rotary axis is turning in an anti-clockwise direction when moving in a positive direction.

MD irrelevant:

if the "5-Axis Transformation" option is not installed.

24530	TRAFO5_NON_POLE_LIMIT_1			C07	F2	
degrees	Definition of pole range for 5-axis transformation 1			DOUBLE	NEW CONF	
-						
-	-	2.0, 2.0, 2.0, 2.0, 2.0, 2.0, 2.0, 2.0...	-MD_DBLMAX	1.0E+301	7/7	U

Description:

This MD designates a limit angle for the fifth axis of the first 5-axis transformation with the following properties: if the path runs below this angle past the pole, the traverse will pass through the pole.

For the 5-axis transformation, the two orientation axes of the tool form a coordinate system of length and width circles on a spherical surface. If orientation programming (that is the orientation vector lies in a plane) leads the path so close past the pole that the angle defined by the MD is undershot then there is a deviation from the defined interpolation such that the interpolation runs through the pole.

Alarm 14112 is output if this modification of the path gives a deviation greater than a tolerance defined by MD24540 TRAFO5\$MC_TRAFO5_POLE_LIMIT_1.

MD irrelevant:

If the "5-Axis Transformation" option is not installed.

Also irrelevant with programming in the machine coordinate system ORIMKS.

Related to:

MD: TRAFO5_POLE_LIMIT_n

24540	TRAFO5_POLE_LIMIT_1			C07	F2, M1	
degrees	End angle tolerance with interpolation through pole for 5-axis transf.			DOUBLE	NEW CONF	
-						
-	-	2.0, 2.0, 2.0, 2.0, 2.0, 2.0, 2.0, 2.0...	-MD_DBLMAX	1.0E+301	7/7	U

Description:

This MD designates an end angle tolerance for the fifth axis of the first 5-axis transformation with the following properties:

With the interpolation through the pole point, only the fifth axis moves, the fourth axis retains its starting position. If a motion is programmed that does not run exactly through the pole point but will run near the pole within the area given by MD: TRAFO5_NON_POLE_LIMIT_n, there is a deviation from the defined path as the interpolation runs exactly through the pole point. This results in a deviation in the position of the end point of the fourth axis (the polar axis) from the programmed value.

2.3 NC machine data

This MD defines the angle by which the polar axis may deviate from the programmed value with 5-axis transformation when switching from the programmed interpolation to the interpolation through the pole point.

Alarm 14112 is output if there is a greater deviation and the interpolation is not executed.

MD irrelevant:

If the "5-Axis Transformation" option is not installed.

Also irrelevant with programming in the machine coordinate system ORIMKS.

Related to:

MD2.... \$MC_TRAFO5_NON_POLE_LIMIT...

24542	TRAFO5_POLE_TOL_1			C07	-	
degrees	End angle tolerance for tool orientation			DOUBLE	NEW CONF	
-						
-	-	0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0...	0.0	1.0E+301	7/7	U

Description:

End angle tolerance for interpolation through the pole for the 1st 5/6-axis transformation.

This MD is evaluated only by the generic 5/6-axis transformation.

If the programmed end orientation lies within the body cone and within the tolerance cone specified by this MD, the pole axis does not move and retains its starting positions. The other rotary axis, however, moves to the programmed angle.

This results in the end orientation deviating from the programmed orientation.

Another function of this MD is the handling of the programmed end orientation with non-orthogonal kinematics. As a rule, not all tool orientations can be set with these machine kinematics.

Alarm 14112 is output if an orientation is programmed that lies outside the settable range of the orientation cone (the programmed orientation path is not possible).

However, if the programmed orientation still lies within the range defined by MD24542 \$MC_TRAFO5_POLE_TOL,

an alarm is not output, and the programmed orientation is accepted.

However, the programmed orientation is corrected so that the orientation remains stationary at the edge of the settable range.

The maximum active value of this MD is the value of MD TRAFO5_POLE_LIMIT_1, which is used to define the body cone.

24550	TRAFO5_BASE_TOOL_1			C07	F2, M1, W1	
mm	Vector of base tool on activation of 5-axis transformation 1			DOUBLE	NEW CONF	
-						
-	3	0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, ...	-MD_DBLMAX	1.0E+301	7/7	U

Description:

This MD specifies the vector of the base tool which takes effect when the first transformation is activated without a length compensation being selected. Programmed length compensations have an additive effect with respect to the base tool.

MD irrelevant:

if the "5-Axis Transformation" option is not installed.

24558	TRAFO5_JOINT_OFFSET_PART_1			C07	F2, M1, W1	
mm	Vector of kinematic table offset			DOUBLE	NEW CONF	
-						
-	3	0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, ...	-MD_DBLMAX	1.0E+301	7/7	U

Description: This machine data is only evaluated for generic 5-axis transformations with rotatable workpiece and rotatable tool (TRAFO_TYPE = 56, mixed kinematics).

It indicates the part of the vector between table and turning head assigned to the table.

Only the sum of this MD and MD TRAFO5_JOINT_OFFSET is entered in the transformation equations.

A difference results only when reading the whole tool length using the function GETTCOR. In this case, only the MD TRAFO5_JOINT_OFFSET is considered.

On a machine with mixed kinematics, this machine data can be used to assign the machine data of the 5-axis transformation and the parameters of the orientable tool holder uniquely to one another as follows:

Orientable tool holder	5-axis transformation (1st transformation)
1	TRAFO5_JOINT_OFFSET_1
2	TRAFO5_BASE_TOOL_1
3	TRAFO5_JOINT_OFFSET_PART_1
4	TRAFO5_PART_OFFSET_1

24560	TRAFO5_JOINT_OFFSET_1			C07	F2, W1

-	Direction of the 3rd rotary axis			DOUBLE	NEW CONF	
-						
-	3	0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, ...	-MD_DBLMAX	1.0E+301	7/7	U

Description: Indicates the vector which defines the direction of the third rotary axis in the case of the general 6-axis transformation (TRAFO_TYPE_* = 24, 40, 56, 57).

The vector may have any value except zero.

Example:

The same axis is defined with both (0, 1, 0) and (0, 7.21, 0) (in the direction of the 2nd geometry axis, that is as a rule Y).

Valid for the first orientation transformation of a channel.

24574	TRAFO5_BASE_ORIENT_1			C07	F2, M1	
-	Vector of the tool base orientation for 5-axis transformation			DOUBLE	NEW CONF	
-						
-	3	0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, ...	-MD_DBLMAX	1.0E+301	7/7	U

Description: Indicates the vector of the tool orientation in the general 5-axis transformation (TRAFO_TYPE_* = 24, 40, 56) if this is not defined on the transformation call or read from a programmed tool.

The vector can have any magnitude except zero.

24576	TRAFO6_BASE_ORIENT_NORMAL_1			C07	F2	
-	Normal tool vector in 6-axis transformation			DOUBLE	NEW CONF	
-						
-	3	0.0, 1.0 , 0.0, 0.0, 1.0 , 0.0, 0.0, 1.0 , 0.0, 0.0, 1.0 , 0.0, ...	-MD_DBLMAX	1.0E+301	7/7	U

Description: Indicates a vector that is perpendicular to the tool orientation (TRAFO5_BASE_ORIENTATION_1) in the case of the general 6-axis transformation (TRAFO_TYPE_* = 24, 40, 56, 57).

If TRAFO6_BASE_ORIENT_NORMAL_1 and TRAFO5_BASE_ORIENTATION_1 are neither orthogonal nor parallel, then the two vectors are orthogonalized by modifying the normal vector. The two vectors must not be parallel.

The vector may have any value other than zero.

2.3 NC machine data

Valid for the first orientation transformation of a channel.

24580	TRAFO5_TOOL_VECTOR_1			C07	F2

-	TCARR number for the 1st 5-axis transformation			DWORD	NEW CONF	
-						
-	-	0, 0, 0, 0, 0, 0, 0, 0...	-	-	7/7	U

Description: If the value of this machine data is not zero and if MD2.... \$MC_TRAFO_TYPE..., which points to the first orientation transformation, has the value 72, then the kinematics data (offsets etc.) that parameterize the first 5-axis transformation, will not be read from the machine data, but from the data of the orientable tool carrier to which this machine data refers.

24585	TRAFO5_ORIAX_ASSIGN_TAB_1			C07	F2, M1	
-	Orientation axis / channel axis assignment transformation 1			BYTE	NEW CONF	
-						
-	3	0, 0...	0	20	7/2	M

Description: Assignment table of the orientation axes for 5-axis transformation 1
Only active with active 5-axis transformation 1.

24590	TRAFO5_ROT_OFFSET_FROM_FR_1			C01, C07	F2	
-	Offset of transformation rotary axes from WO.			BOOLEAN	NEW CONF	
-						
-	-	FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE...	0	-	7/2	M

Description: The positions (angles) of the rotary axes are defined by the offset for the orientation axes of the 5/6-axis transformation, whereby the tool orientation is in the basic position. This offset has 2 components. The first one is the value of MD24510 \$MC_TRAFO5_ROT_AX_OFFSET_1 for the 1st orientation transformation. For the other orientation transformations, these are the values of MD24610/25210/25310 \$MC_TRAFO5_ROT_AX_OFFSET_2/3/4/. The 2nd component is defined when the transformation is activated. Either directly as an optional parameter with the language command TRAORI(), or it can be taken from an active work offset of the rotary axes that are active when the transformation is activated. This is only taken into the offset of the orientation axes if this MD has the value TRUE, and if the work offsets are retained when the transformation is activated, this means that MD10602: \$MN_FRAME_GEOAX_CHANGE_MODE > 0.

Note: In the normal case, the automatic acceptance of active work offsets into the offset is only useful for the polar axis with table kinematics. This means, for example, with AC kinematics for the C-axis. If the offset is changed in another orientation axis, especially in the non-polar axis, this changes the kinematic behavior of the transformation, and may lead to the compensatory motions of the linear axes no longer being correct.

24594	TRAFO7_EXT_ROT_AX_OFFSET_1			C07	F2	
degrees	Position offset of the external rotary axes for 7-axis transformation 1			DOUBLE	NEW CONF	
-						
-	3	0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0,...	-MD_DBLMAX	1.0E+301	7/7	U

Description: This machine data designates the angular offset of the external rotary axis in degrees for the first 7-axis transformation of a channel.
MD irrelevant:
if the "5-Axis Transformation" option is not installed.

24595	TRAFO7_EXT_AXIS1_1			C07	F2	
-	Direction of the 1st external rotary axis			DOUBLE	NEW CONF

Description: The MD indicates the vector that describes the direction of the first external rotary axis in the general 5/6-axis transformation (TRAFO_TYPE_* = 24).
The vector can have any magnitude.
Example:
Both with (0, 1, 0) and with (0, 7.21, 0), the same axis is described (in the direction of the 2nd geometry axis, i.e. usually Y).
Valid for the first transformation of a channel.

24600	TRAFO5_PART_OFFSET_2			C07	M1	
mm	Offset vector of the 2nd 5-axis transformation in the channel			DOUBLE	NEW CONF	
-						
-	3	0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, ...	-MD_DBLMAX	1.0E+301	7/7	U

Description: This machine data designates an offset of the workpiece carrier for the first (MD24500 \$MC_TRAFO5_PART_OFFSET_1) or second (MD24600 \$MC_TRAFO5_PART_OFFSET_2) 5-axis transformation of a channel, and has a specific meaning for the different machine types:
Machine type 1 (two-axis swivel head for tool):
Vector from machine reference point to zero point of workpiece table. This will generally be a zero vector if both coincide.
Machine type 2 (two-axis rotary table for workpiece):
Vector from second joint of workpiece rotary table to zero point of table.
Machine type 3 (single-axis rotary table for workpiece and single-axis swivel head for tool):
Vector from joint of workpiece table to zero point of table.
MD irrelevant:
if the "5-Axis Transformation" option is not installed.

2.3 NC machine data

24610	TRAFO5_ROT_AX_OFFSET_2			C07	M1	
degrees	Position offset of rotary axes 1/2/3			DOUBLE	NEW CONF	
-						
-	3	0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0,...	-MD_DBLMAX	1.0E+301	7/7	U

Description: Indicates the offset for each channel of the rotary axes in degrees for the second orientation transformation.

24620	TRAFO5_ROT_SIGN_IS_PLUS_2			C07	F2, M1	
-	Sign of rotary axis 1/2/3 for 5-axis transformation 2			BOOLEAN	NEW CONF	
-						
-	3	TRUE, TRUE, TRUE, TRUE, TRUE, TRUE, TRUE, TRUE, TRUE, TRUE, TRUE...	0	-	7/7	U

Description: This machine data designates the sign with which the two rotary axes are included in the second 5-axis transformation of a channel.

MD = 0 (FALSE):

Sign is reversed.

MD = 1 (TRUE) :

Sign is not reversed and the traversing direction is defined according to MD32100 \$MA_AX_MOTION_DIR.

This machine data does not mean that the rotational direction of the rotary axis concerned is to be reversed, but specifies whether its motion is in the mathematically positive or negative direction when the axis is moving in the positive direction.

The result of a change to this data is not therefore a change in the rotational direction, but a change in the compensatory motion of the linear axes.

However, if a directional vector and thus, implicitly, a compensatory motion is specified, the result is a change in the rotational direction of the rotary axis concerned.

On a real machine, therefore, the machine data may be set to FALSE (or zero) only if the rotary axis is turning in an anti-clockwise direction when moving in a positive direction.

MD irrelevant:

if the "5-Axis Transformation" option is not installed.

24630	TRAFO5_NON_POLE_LIMIT_2			C07	F2, M1	
degrees	Definition of pole range for 5-axis transformation 2			DOUBLE	NEW CONF	
-						
-	-	2.0, 2.0, 2.0, 2.0, 2.0, 2.0, 2.0, 2.0...	-MD_DBLMAX	1.0E+301	7/7	U

Description: This MD designates a limit angle for the fifth axis of the second 5-axis transformation with the following properties: if the path runs past the pole below this angle, the traverse passes through the pole.

In a 5-axis transformation, the two orientation axes of the tool form a coordinate system of length and width circles on a spherical surface. If orientation programming (that is the orientation vector lies in a plane) leads the path so closely past the pole that the angle defined by this MD is undershot, then there is a deviation from the defined interpolation such that the interpolation runs through the pole.

Alarm 14112 is output if this modification of the path results in a deviation greater than a tolerance defined by MD24640 \$MC_TRAFO5_POLE_LIMIT_2.

MD irrelevant:

If the "5-Axis Transformation" option is not installed.

Also irrelevant with programming in the machine coordinate system ORIMKS.

Related to:

MD2.... \$MC_TRAFO5_POLE_LIMIT...

24640	TRAFO5_POLE_LIMIT_2			C07	F2, M1	
degrees	End angle tolerance for tool orientation			DOUBLE	NEW CONF	
-						
-	-	2.0, 2.0, 2.0, 2.0, 2.0, 2.0, 2.0, 2.0...	-MD_DBLMAX	1.0E+301	7/7	U

Description:

This MD designates an end angle tolerance for the fifth axis of the second 5-axis transformation with the following properties:

With the interpolation through the pole point, only the fifth axis moves, the fourth axis retains its starting position. If a motion is programmed that does not run exactly through the pole point but is to run near the pole within the area given by MD: TRAFO5_NON_POLE_LIMIT_n then there is a deviation from the defined path as the interpolation runs exactly through the pole point. This results in a deviation in the position of the end point of the fourth axis (the polar axis) from the programmed value.

This MD defines the angle by which the polar axis may deviate from the programmed value with 5-axis transformation when switching from the programmed interpolation to the interpolation through the pole point.

An error message (alarm 14112) is output if there is a greater deviation and the interpolation is not executed.

MD irrelevant:

If the "5-Axis Transformation" option is not installed.

Also irrelevant with programming in the machine coordinate system ORIMKS.

MD24530 \$MC_TRAFO5_NON_POLE_LIMIT_1

24642	TRAFO5_POLE_TOL_2			C07	-	
degrees	End angle tolerance for pole interpolation			DOUBLE	NEW CONF	
-						
-	-	0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0...	0.0	1.0E+301	7/7	U

Description:

End angle tolerance for interpolation through the pole for the 2nd 5/6-axis transformation.

This MD is evaluated only by the generic 5/6-axis transformation.

If the programmed end orientation lies within the body cone and within the tolerance cone

specified by this MD, the pole axis does not move and retains its starting positions.

However, the other rotary axis moves to the programmed angle.

This results in the end orientation deviating from the programmed orientation.

Another function of this MD is the handling of the programmed end orientation with non-orthogonal kinematics. As a rule, not all tool orientations can be set with these machine kinematics.

Alarm 14112 is output if an orientation is programmed that lies outside the settable range of the orientation cone (the programmed orientation path is not possible).

2.3 NC machine data

However, if the programmed orientation still lies within the range defined by MD24542 \$MC_TRAFO5_POLE_TOL,

an alarm is not output, and the programmed orientation is accepted.

However, the programmed orientation is corrected so that the orientation remains stationary at the edge of the settable range.

The maximum active value of this MD is the value of MD TRAFO5_POLE_LIMIT_1, which is used to define the body cone.

24650	TRAFO5_BASE_TOOL_2			C07	M1, W1	
mm	Vector of base tool on activation of 5-axis transformation 2			DOUBLE	NEW CONF	
-						
-	3	0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, ...	-MD_DBLMAX	1.0E+301	7/7	U

Description: This MD indicates the vector of the base tool which takes effect when the second transformation is activated without a length compensation being selected. Programmed length compensations have an additive effect with respect to the base tool.

MD irrelevant:

if the "5-Axis Transformation" option is not installed.

-	Velocity margin for 1st TRAANG transformation			DOUBLE	NEW CONF	
-						
-	-	0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0...	0.0	1.0	7/7	U

Description: Indicates the axis velocity reserve for jog, positioning and oscillating movements for each channel for the first TRAANG transformation which is held ready on the parallel axis (see MD2.... \$MC_TRAFO_AXES_IN_...[1]) for the compensating movement. Velocity reserve to be provided for jog, positioning and oscillating movements on the parallel axis to handle the compensating movement as a consequence of the inclined axis.

0.0 means that the control or the transformation itself determines the reserve according to the angle of the inclined axis and the velocity capacity of the inclined and parallel axes. - The criterion for this is that the same velocity limit has to be maintained in the direction of the parallel axis and the (virtual) axis at right-angles to it.

>0.0 means that a fixed reserve has been set (MD24720 \$MC_TRAANG_PARALLEL_VELO_RES_1 * MD32000 \$MA_MAX_AX_VELO of the parallel axis). The velocity capacity in the virtual axis is determined by this. The lower MD24720 \$MC_TRAANG_PARALLEL_VELO_RES_1 has been set, the lower it is

2.3 NC machine data

Related to:

MD24920 \$MC_TRANSMIT_BASE_TOOL_1

24995	TRACON_CHAIN_1			C07	M1	
-	Transformation grouping			DWORD	NEW CONF	
-						
-	4	0,0,0,0,0,0,0,0,0,0, 0,0,0,0,0,0,0,0,0,0, 0,0...	0	20	7/7	U

Description:

Transformation chain of the first concatenated transformation.

In the table, the numbers of the transformations which are to be concatenated are given in the order in which the transformation has to be executed from BCS into MCS.

Example:

A machine can be operated optionally either as a 5-axis machine or as a transmit machine. A linear axis is not arranged at a right-angles to the other linear axes (inclined axis).

5 transformations must be set via the machine data, e.g.

TRAFO_TYPE_1 = 16 (5-axis transformation)

TRAFO_TYPE_2 = 256 (Transmit)

TRAFO_TYPE_3 = 1024 (Inclined axis)

TRAFO_TYPE_4 = 8192 (Concatenated transformation)

TRAFO_TYPE_5 = 8192 (Concatenated transformation)

If the 4th transformation concatenates the 5-axis transformation / inclined axis and the 5th transformation concatenates the transmit / inclined axis, then (1, 3, 0, 0) is entered in the first table TRACON_CHAIN_1, and (2, 3, 0, 0) in the table TRACON_CHAIN_2. The entry 0 means no transformation.

The order in which the transformations are assigned (TRAFO_TYPE_1 to TRAFO_TYPE_20) is arbitrary. The linked transformations do not have to be the last. However, they must always stand behind all the transformations which occur in a transformation chain. In the previous example, this means that, e.g. the third and fourth transformations must not be switched.

However, it would be possible to define a further, sixth transformation, if this does not go into a linked transformation.

Transformations cannot be linked with one another at will.

The following limitations apply in SW version 5:

The first transformation in the chain must be an orientation transformation (3- , 4- , 5-axis transformation, nutator) transmit or peripheral curve transformation. The second transformation must be an inclined axis transformation.

No more than two transformations may be linked.

24996	TRACON_CHAIN_2			C07	M1	
-	Transformation grouping			DWORD	NEW CONF	
-						
-	4	0,0,0,0,0,0,0,0,0,0, 0,0,0,0,0,0,0,0,0,0, 0,0...	0	20	7/7	U

Description:

Other than that it has the same meaning as TRAFO5_PART_OFFSET_1.

2.3 NC machine data

25210	TRAFO5_ROT_AX_OFFSET_3			C07	F2	
degrees	Position offset of rotary axes 1/2/3 for 5-axis transformation 3			DOUBLE	NEW CONF	
-						
-	3	0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0,...	-MD_DBLMAX	1.0E+301	7/7	U

Description: This machine data designates the angular offset of the first or second rotary axis in degrees for the 3rd 5-axis transformation of a channel.

Other than that it has the same meaning as TRAFO5_ROT_AX_OFFSET_1.

25220	TRAFO5_ROT_SIGN_IS_PLUS_3			C07	F2	
-	Sign of rotary axis 1/2/3 for 5-axis transformation 3			BOOLEAN	NEW CONF	
-						
-	3	TRUE, TRUE, TRUE, TRUE, TRUE, TRUE, TRUE, TRUE, TRUE, TRUE, TRUE...	0	-	7/7	U

Description: This machine data designates the sign with which the two rotary axes enter the 3rd 5-axis transformation of a channel.

Other than that it has the same meaning as TRAFO5_ROT_SIGN_IS_PLUS_1.

25230	TRAFO5_NON_POLE_LIMIT_3			C07	F2	
degrees	Definition of pole range for 5-axis transformation 3			DOUBLE	NEW CONF	
-						
-	-	2.0, 2.0, 2.0, 2.0, 2.0, 2.0, 2.0, 2.0...	-MD_DBLMAX	1.0E+301	7/7	U

Description: This machine data designates a limit angle for the fifth axis of the 3rd 5-axis transformation.

Other than that it has the same meaning as TRAFO5_NON_POLE_LIMIT_1.

25240	TRAFO5_POLE_LIMIT_3			C07	F2	
degrees	End angle tolerance with interpolation through pole for 5-axis transf.			DOUBLE	NEW CONF	
-						
-	-	2.0, 2.0, 2.0, 2.0, 2.0, 2.0, 2.0, 2.0...	-MD_DBLMAX	1.0E+301	7/7	U

Description: This machine data designates an end angle tolerance for the fifth axis of the 3rd 5-axis transformation with the following properties:

Other than that it has the same meaning as TRAFO5_POLE_LIMIT_1.

25242	TRAFO5_POLE_TOL_3			C07	-	
degrees	End angle tolerance for tool orientation			DOUBLE	NEW CONF	
-						
-	-	0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0...	0.0	1.0E+301	7/7	U

Description: End angle tolerance for interpolation through the pole for 5/6-axis transformation 3.

Other than that it has the same meaning as TRAFO5_POLE_TOL_1.

25250	TRAFO5_BASE_TOOL_3			C07	F2	
mm	Vector of base tool on activation of 5-axis transformation 3			DOUBLE	NEW CONF	
-						
-	3	0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, ...	-MD_DBLMAX	1.0E+301	7/7	U

Description: This MD indicates the vector of the base tool which takes effect when the third transformation is activated without a length compensation being selected. Programmed length compensations have an additive effect with respect to the base tool.

MD irrelevant:
if the "5-axis transformation" option is not installed.

25258	TRAFO5_JOINT_OFFSET_PART_3			C07	F2	
mm	Vector of kinematic table offset			DOUBLE	NEW CONF	
-						
-	3	0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, ...	-MD_DBLMAX	1.0E+301	7/7	U

Description: This machine data is only evaluated in generic 5-axis transformations with rotatable workpiece and rotatable tool (TRAFO_TYPE = 56, mixed kinematics).

Other than that it has the same meaning as TRAFO5_JOINT_OFFSET_PART_1.

25260	TRAFO5_JOINT_OFFSET_3			C07	F2	
mm	Vector of the kinem.offset of the 3rd 5-axis transf. in channel			DOUBLE	NEW CONF	
-						
-	3	0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, ...	-MD_DBLMAX	1.0E+301	7/7	U

Description: This machine data designates the vector from the first to the second rotary joint for the 3rd transformation of a channel.

Other than that it has the same meaning as TRAFO5_JOINT_OFFSET_1.

25261	TRAFO6_JOINT_OFFSET_2_3_3			C07	-	
mm	Vector of kinematic offset			DOUBLE	NEW CONF	
-						
-	3	0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, ...	-MD_DBLMAX	1.0E+301	7/7	U

Description: In the case of 6-axis transformations, defines the offset between the 2nd and third rotary axes for the 3rd transformation of each channel.

25262	TRAFO5_TOOL_ROT_AX_OFFSET_3			C07	F2	
mm	Offset of swivel point of the rotary axis on the 3rd 5-axis transformation			DOUBLE	NEW CONF	
-						
-	3	0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, ...	-MD_DBLMAX	1.0E+301	7/7	U

Description: In the case of a 5-axis transformation with a swiveling linear axis, the value indicates the offset of the rotary axis which swivels the linear axis with reference to machine zero for the 3th transformation.

Other than that it has the same meaning as >TRAFO5_TOOL_ROT_AX_OFFSET_1.

2.3 NC machine data

25264	TRAFO5_NUTATOR_AX_ANGLE_3			C07	F2	
degrees	Nutating head angle in 5-axis transformation			DOUBLE	NEW CONF	
-						
-	-	45.0, 45.0, 45.0, 45.0, 45.0, 45.0, 45.0, 45.0...	-89.	89.	7/7	U

Description: Angle between the second rotary axis and the axis corresponding to it in the rectangular coordinate system
Other than that it has the same meaning as TRAF05_NUTATOR_AX_ANGLE_1.

25266	TRAFO5_NUTATOR_VIRT_ORIAX_3			C07	-	
-	Virtual orientation axes			BOOLEAN	NEW CONF	
-						
-	-	FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE...	0	-	7/7	U

Description: It has the same meaning as TRAF05_NUTATOR_VIRT_ORIAX_1.

25270	TRAFO5_AXIS1_3			C07	F2	
-	Direction of 1st rotary axis			DOUBLE	NEW CONF	
-						
-	3	0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, 0.0, 0.0, 0.0, ...	-MD_DBLMAX	1.0E+301	7/7	U

Description: The MD designates the vector that describes the direction of the first rotary axis with the general 5-axis transformation (TRAF0_TYPE_* = 24).
Other than that it has the same meaning as TRAF05_AXIS1_1.

25272	TRAFO5_AXIS2_3			C07	F2	
-	Direction of 2nd rotary axis			DOUBLE	NEW CONF	
-						
-	3	0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, ...	-MD_DBLMAX	1.0E+301	7/7	U

Description: The MD designates the vector that describes the direction of the second rotary axis with the general 5-axis transformation (TRAF0_TYPE_* = 24, 40, 56).
Other than that it has the same meaning as TRAF05_AXIS2_1.

25273	TRAF05_AXIS3_3			C07	-	
-	Direction of the 3rd rotary axis			DOUBLE	NEW CONF	
-						
-	3	0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, ...	-MD_DBLMAX	1.0E+301	7/7	U

Description: The MD designates the vector that describes the direction of the third rotary axis with the general 6-axis transformation (TRAF0_TYPE_* = 24, 40, 56, 57).
Other than that it has the same meaning as TRAF05_AXIS3_1.

25274	TRAFO5_BASE_ORIENT_3			C07	-	
-	Vector of the tool base orientation for 5-axis transformation			DOUBLE	NEW CONF	
-						
-	3	0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, ...	-MD_DBLMAX	1.0E+301	7/7	U

Description: Indicates the vector of the tool orientation in the general 5-axis transformation (TRAFO_TYPE_* = 24, 40, 56) if this is not defined on the transformation call or not read from a programmed tool.

Other than that it has the same meaning as TRAFO5_BASE_ORIENT_1.

25276	TRAFO6_BASE_ORIENT_NORMAL_3			C07	-	
-	Normal tool vector in 6-axis transformation			DOUBLE	NEW CONF	
-						
-	3	0.0, 1.0 , 0.0, 0.0, 1.0 , 0.0, 0.0, 1.0 , 0.0, 0.0, 1.0 , 0.0, ...	-MD_DBLMAX	1.0E+301	7/7	U

Description: Indicates the vector that stands vertically on the tool orientation (TRAFO5_BASE_ORIENTATION_1) in general 6-axis transformation (TRAFO_TYPE_* = 24, 40, 56, 57).

Other than that it has the same meaning as TRAFO6_BASE_ORIENT_NORMAL_1.

25280	TRAFO5_TOOL_VECTOR_3			C07	F2	
-	Direction of orientation vector for the first 5-axis transf.			BYTE	NEW CONF	
-						
-	-	2, 2, 2, 2, 2, 2, 2, 2...	0	2	7/2	M

Description: Indicates the direction of the orientation vector for the first 5-axis transformation for each channel.

Other than that it has the same meaning as TRAFO5_TOOL_VECTOR_1.1.

25282	TRAFO5_TCARR_NO_3			C07	-	
-	TCARR number for the 3rd 5-axis transformation			DWORD	NEW CONF	
-						
-	-	0, 0, 0, 0, 0, 0, 0, 0...	-	-	7/7	U

Description: It has the same meaning as TRAFO5_TCARR_NO_1.

25285	TRAFO5_ORIAX_ASSIGN_TAB_3			C07	F2, M1	
-	Orientation axis / channel axis assignment transformation 3			BYTE	NEW CONF	
-						
-	3	0, 0...	0	20	7/2	M

Description: Assignment table of the orientation axes for 5-axis transformation 3
Only active with active 5-axis transformation 3.

Otherwise the meaning is the same as TRAFO5_ORIAX_ASSIGN_TAB_1.

2.3 NC machine data

25290	TRAFO5_ROT_OFFSET_FROM_FR_3			C01, C07	-	
-	Offset of transformation rotary axes from WO.			BOOLEAN	NEW CONF	
-						
-	-	FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE...	0	-	7/2	M

Description: It has the same meaning as TRAFO5_ROT_OFFSET_FROM_FR_1.

25294	TRAFO7_EXT_ROT_AX_OFFSET_3			C07	F2	
degrees	Position offset of the external rotary axes for 7-axis transformation 3			DOUBLE	NEW CONF	
-						
-	3	0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0,...	-MD_DBLMAX	1.0E+301	7/7	U

Description: This machine data designates the angular offset of the external rotary axis in degrees for the third 7-axis transformation of a channel.

MD irrelevant:

if the "5-Axis Transformation" option is not installed.

25295	TRAFO7_EXT_AXIS1_3			C07	F2	
-	Direction of the 1st external rotary axis			DOUBLE	NEW CONF	
-						
-	3	0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, ...	-MD_DBLMAX	1.0E+301	7/7	U

Description: The MD indicates the vector that describes the direction of the first external rotary axis in the third general 5/6-axis transformation (TRAFO_TYPE_* = 24).

The vector can have any magnitude.

Example:

Both with (0, 1, 0) and with (0, 7.21, 0), the same axis is described (in the direction of the 2nd geometry axis, i.e. usually Y).

Valid for the first transformation of a channel.

25300	TRAFO5_PART_OFFSET_4			C07	F2	
mm	Offset vector of 5-axis transformation 4			DOUBLE	NEW CONF	
-						
-	3	0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, ...	-MD_DBLMAX	1.0E+301	7/7	U

Description: This machine data designates an offset of the workpiece holder for the 4th 5-axis transformation of a channel and has a special meaning for each of the various machine types:

Other than that it has the same meaning as TRAFO5_PART_OFFSET_1.

25310	TRAFO5_ROT_AX_OFFSET_4			C07	F2	
degrees	Position offset of rotary axes 1/2/3 for 5-axis transformation 4			DOUBLE	NEW CONF	
-						
-	3	0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0,...	-MD_DBLMAX	1.0E+301	7/7	U

Description: This machine data designates the angular offset of the first or second rotary axis in degrees for the 4th 5-axis transformation of a channel.
Other than that it has the same meaning as TRAF05_ROT_AX_OFFSET_1.

25320	TRAF05_ROT_SIGN_IS_PLUS_4			C07	F2	
-	Sign of rotary axis 1/2/3 for 5-axis transformation 4			BOOLEAN	NEW CONF	
-						
-	3	TRUE, TRUE, TRUE, TRUE, TRUE, TRUE, TRUE, TRUE, TRUE, TRUE...	0	-	7/7	U

Description: This machine data designates the sign with which the two rotary axes enter the 4th 5-axis transformation of a channel.
Other than that it has the same meaning as TRAF05_ROT_SIGN_IS_PLUS_1.

25330	TRAF05_NON_POLE_LIMIT_4			C07	F2	
degrees	Definition of pole range for 5-axis transformation 4			DOUBLE	NEW CONF	
-						
-	-	2.0, 2.0, 2.0, 2.0, 2.0, 2.0, 2.0, 2.0...	-MD_DBLMAX	1.0E+301	7/7	U

Description: This machine data designates a limit angle for the fifth axis of the 4th 5-axis transformation.
Other than that it has the same meaning as TRAF05_NON_POLE_LIMIT_1.

25340	TRAF05_POLE_LIMIT_4			C07	F2	
degrees	End angle tolerance with interpolation through pole for 5-axis transf.			DOUBLE	NEW CONF	
-						
-	-	2.0, 2.0, 2.0, 2.0, 2.0, 2.0, 2.0, 2.0...	-MD_DBLMAX	1.0E+301	7/7	U

Description: This machine data designates an end angle tolerance for the fifth axis of the 4th 5-axis transformation with the following properties:
Other than that it has the same meaning as TRAF05_POLE_LIMIT_1.

25342	TRAF05_POLE_TOL_4			C07	-	
degrees	End angle tolerance for tool orientation			DOUBLE	NEW CONF	
-						
-	-	0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0...	0.0	1.0E+301	7/7	U

Description: End angle tolerance for interpolation through the pole for 5/6-axis transformation 4.
Other than that it has the same meaning as TRAF05_POLE_TOL_1.

25350	TRAF05_BASE_TOOL_4			C07	F2	
mm	Vector of base tool on activation of 5-axis transformation 4			DOUBLE	NEW CONF	
-						
-	3	0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, ...	-MD_DBLMAX	1.0E+301	7/7	U

Description: This MD indicates the vector of the base tool which takes effect when the first transformation is activated without a length compensation being selected. Programmed length compensations have an additive effect with respect to the base tool.
MD irrelevant:

2.3 NC machine data

if the "5-axis transformation" option is not installed.

25358	TRAFO5_JOINT_OFFSET_PART_4			C07	F2	
mm	Vector of kinematic table offset			DOUBLE	NEW CONF	
-						
-	3	0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, ...	-MD_DBLMAX	1.0E+301	7/7	U

Description: This machine data is only evaluated in generic 5-axis transformations with rotatable workpiece and rotatable tool (TRAF0_TYPE = 56, mixed kinematics).
Other than that it has the same meaning as TRAF05_JOINT_OFFSET_PART_1.

25360	TRAFO5_JOINT_OFFSET_4			C07	F2	
mm	Vector of the kinem.offset of the 4th 5-axis transf. in channel			DOUBLE	NEW CONF	
-						
-	3	0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, ...	-MD_DBLMAX	1.0E+301	7/7	U

Description: This machine data designates the vector from the first to the second rotary joint for the 4th transformation of a channel.
Other than that it has the same meaning as TRAF05_JOINT_OFFSET_1.

25361	TRAFO6_JOINT_OFFSET_2_3_4			C07	-	
mm	Vector of kinematic offset			DOUBLE	NEW CONF	
-						
-	3	0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, ...	-MD_DBLMAX	1.0E+301	7/7	U

Description: In the case of 6-axis transformations, defines the offset between the 2nd and third rotary axes for the 4th transformation of each channel.

25362	TRAF05_TOOL_ROT_AX_OFFSET_4			C07	F2	
mm	Offset of swivel point of the rotary axis on the 4th 5-axis transformation			DOUBLE	NEW CONF	
-						
-	3	0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, ...	-MD_DBLMAX	1.0E+301	7/7	U

Description: In the case of a 5-axis transformation with a swiveling linear axis, the value indicates the offset of the rotary axis which swivels the linear axis with reference to machine zero for the 4th transformation.
Other than that it has the same meaning as >TRAF05_TOOL_ROT_AX_OFFSET_1.

25364	TRAF05_NUTATOR_AX_ANGLE_4			C07	F2	
degrees	Nutating head angle in 5-axis transformation			DOUBLE	NEW CONF	
-						
-	-	45.0, 45.0, 45.0, 45.0, 45.0. 45.0. 45.0. 45.0...	-89.	89.	7/7	U

Description: Angle between the second rotary axis and the axis corresponding to it in the rectangular coordinate system
Other than that it has the same meaning as TRAF05_NUTATOR_AX_ANGLE_1.

25366	TRAFO5_NUTATOR_VIRT_ORIAX_4			C07	-	
-	Virtual orientation axes			BOOLEAN	NEW CONF	
-						
-	-	FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE...	0	-	7/7	U

Description: It has the same meaning as TRAFO5_NUTATOR_VIRT_ORIAX_1.

25370	TRAFO5_AXIS1_4			C07	F2	
-	Direction of 1st rotary axis			DOUBLE	NEW CONF	
-						
-	3	0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, ...	-MD_DBLMAX	1.0E+301	7/7	U

Description: The MD designates the vector that describes the direction of the first rotary axis with the general 5-axis transformation (TRAFO_TYPE_* = 24).
Other than that it has the same meaning as TRAFO5_AXIS1_1.

25372	TRAFO5_AXIS2_4			C07	F2	
-	Direction of 2nd rotary axis			DOUBLE	NEW CONF	
-						
-	3	0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, ...	-MD_DBLMAX	1.0E+301	7/7	U

Description: The MD designates the vector that describes the direction of the second rotary axis with the general 5-axis transformation (TRAFO_TYPE_* = 24, 40, 56).
Other than that it has the same meaning as TRAFO5_AXIS2_1.

25373	TRAFO5_AXIS3_4			C07	-	
-	Direction of the 3rd rotary axis			DOUBLE	NEW CONF	
-						
-	3	0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0. ...	-MD_DBLMAX	1.0E+301	7/7	U

Description: The MD designates the vector that describes the direction of the third rotary axis with the general 6-axis transformation (TRAFO_TYPE_* = 24, 40, 56, 57).
Other than that it has the same meaning as TRAFO5_AXIS3_1.

25374	TRAFO5_BASE_ORIENT_4			C07	-	
-	Vector of the tool base orientation for 5-axis transformation			DOUBLE	NEW CONF	
-						
-	3	0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, 0.0, 0.0 , 0.0, ...	-MD_DBLMAX	1.0E+301	7/7	U

Description: Indicates the vector of the tool orientation in the general 5-axis transformation (TRAFO_TYPE_* = 24, 40, 56) if this is not defined on the transformation call or not read from a programmed tool.
Other than that it has the same meaning as TRAFO5_BASE_ORIENT_1.

2.3 NC machine data

25376	TRAFO6_BASE_ORIENT_NORMAL_4			C07	-	
-	Normal tool vector in 6-axis transformation			DOUBLE	NEW CONF	
-						
-	3	0.0, 1.0 , 0.0, 0.0, 1.0 , 0.0, 0.0, 1.0 , 0.0, 0.0, 1.0 , 0.0, ...	-MD_DBLMAX	1.0E+301	7/7	U

Description: Indicates the vector that stands vertically on the tool orientation (TRAFO5_BASE_ORIENTATION_1) in general 6-axis transformation (TRAFO_TYPE_* = 24, 40, 56, 57).
Other than that it has the same meaning as TRAFO6_BASE_ORIENT_NORMAL_1.

25380	TRAFO5_TOOL_VECTOR_4			C07	F2	
-	Direction of orientation vector for the first 5-axis transf.			BYTE	NEW CONF	
-						
-	-	2, 2, 2, 2, 2, 2, 2...	0	2	7/2	M

Description: Indicates the direction of the orientation vector for the first 5-axis transformation for each channel.
Other than that it has the same meaning as TRAFO5_TOOL_VECTOR_1.1.

25382	TRAFO5_TCARR_NO_4			C07	-	
-	TCARR number for the 4th 5-axis transformation			DWORD	NEW CONF	
-						
-	-	0, 0, 0, 0, 0, 0, 0, 0...	-	-	7/7	U

Description: It has the same meaning as TRAFO5_TCARR_NO_1.

2.3 NC machine data

Description: Transformation chain of the 8th concatenated transformation.
See TRACON_CHAIN_1 for documentation.

25500	IPT_AXIS_DYNAMIC_FACTORS			-	-	
-	Interpolation turning: Weighting of axis dynamic response			DOUBLE	NEW CONF	
-						
-	5	0.1, 0.5, 0.5, 0.8, 0.8, 0.1, 0.5, 0.5, 0.8, 0.8, 0.1, 0.5, 0.5,...	0.001	0.999	1/1	M

Description: Interpolation turning: Distribution of axis dynamic response between path and rotation component.

26000	PUNCHNIB_ASSIGN_FASTIN			C01, C09	N4	
-	Hardware assignment for input byte for stroke control			UDWORD	PowerOn	
-						
-	-	0, 0, 0, 0, 0, 0, 0, 0...	0	0x7FFFFFFF	7/2	M

Description: Assignment of the high-speed input byte for "punching and nibbling"

Bit 0-7: Number of the input byte used

Bit 8-15: Free

Bit 16-23: Inversion mask for writing the hardware byte

Bit 24-30: Free

This data defines which input byte is to be used for the signal "travel active".

= 1:

On-board inputs (4 high-speed NC inputs) are used.

2, 3, 4, 5

The external digital NC inputs are used

128-129:

Comparator byte (results from high-speed analog inputs or VDI specification)

Related to:

MD26006 \$MC_NIBBLE_PUNCH_INMASK[n]

References:

/FB/, A4, Digital and Analog NC I/Os

The signal is high active as default from software 3.2. That is there is wire break monitoring. If the signal is low active then, e.g., the MD must be set to the value MD="H 0001 0001" for the outboard inputs.

26002	PUNCHNIB_ASSIGN_FASTOUT			C01, C09	N4	
-	Hardware assignment for output byte for stroke control			UDWORD	PowerOn	
-						
-	-	0, 0, 0, 0, 0, 0, 0, 0...	0	0x7FFFFFFF	7/2	M

Description: This data defines which output byte is to be used for the stroke control.

Number of the high-speed output byte for "punching and nibbling"

Bit 0-7: Number of the output byte used

Bit 8-15: Free

Bit 16-23: Inversion mask for writing the hardware byte

Bit 24-30: Free

Possible inputs:

1:

840D on-board outputs (4 high-speed + 4 bits via VDI specification)

2, 3, 4, 5

/FB/, A4, Digital and Analog NC I/Os

Description:	Mask for high-speed output bits for punching and nibbling. Byte 1: Contains the bit for stroke release Bytes 2-8: Currently free Special cases: Only NIBBLE_PUNCH_OUTMASK[0] is significant. This is used to define the output bit for the signal "Release stroke". Related to: MD26002 \$MC PUNCHNIB ASSIGN FASTOUT
---------------------	---

Description:

This data can define up to 8 byte masks for the output of the high-speed bits.
The standard assignment of this data is as follows:

```
NIBBLE_PUNCH_INMASK[0]=1:  
2° = first bit for the first punch interface (SPIF1)  
NIBBLE_PUNCH_INMASK[1]=4:  
Second punch interface (SPIF2), not available as standard  
NIBBLE_PUNCH_INMASK[2]=0  
...  
NIBBLE_PUNCH_INMASK[7]=0
```

Note:

-

Special cases:

Only NIBBLE_PUNCH_INMASK[0] is relevant. This is used to define the input bit for the signal "Stroke active".

MD26000 \$MC PUNCHNIB ASSIGN FASTIN

Machine data and parameters
List Manual, 12/2019, 6FC5397-7AP40-6BA3

2.3 NC machine data

Description: This data defines the special M functions for punching and nibbling.

	Standard value	Example
NIBBLE_PUNCH_CODE[0] = 0	20	End punching, nibbling with M20
NIBBLE_PUNCH_CODE[1] = 23	23	End punching, nibbling with M23
NIBBLE_PUNCH_CODE[2] = 22	22	Start nibbling
NIBBLE_PUNCH_CODE[3] = 25	25	Start punching
NIBBLE_PUNCH_CODE[4] = 26	26	Activate dwell time
NIBBLE_PUNCH_CODE[5] = 122	122	Start nibbling with pretension, stroke control at servo level
NIBBLE_PUNCH_CODE[6] = 125	125	Start punching with pretension, stroke control at servo level
NIBBLE_PUNCH_CODE[7] = 0	0	Not used (in preparation)

Special cases:

If MD26012 \$MC_PUNCHNIB_ACTIVATION = 2 (M functions are interpreted directly by the software), then MD26008 \$MC_NIBBLE_PUNCH_CODE[0] = 20 has to be set.

Related to:

MD26012 \$MC_PUNCHNIB_ACTIVATION

26010	PUNCHNIB_AXIS_MASK	C09	N4
-	Definition of punching and nibbling axes	UDWORD	PowerOn
-			
-	-	7, 0, 0, 0, 0, 0, 0, 0...	0 0x7FFFFFFF 7/2 M

Description: Defines the axes involved in punching and nibbling. That is all the axes defined here must be at rest during punching and nibbling.

Related to:

MD26016 \$MC_PUNCH_PARTITION_TYPE

26012	PUNCHNIB_ACTIVATION	C09	K1
-	Activation of punching and nibbling functions	DWORD	PowerOn
-			
-	-	0, 0, 0, 0, 0, 0, 0, 0...	- - 7/2 M

Description: This MD defines the ways in which punching and nibbling functions can be activated:

PUNCHNIB_ACTIVATION = 0

None of the punching or nibbling functions can be activated. The automatic path segmentation is the only exception - if it is enabled via MD26014

\$MC_PUNCH_PATH_SPLITTING.

PUNCHNIB_ACTIVATION = 1

The functions are activated via language commands. If M functions are to be used, then they must be programmed using macros.

PUNCHNIB_ACTIVATION = 2

The M functions are interpreted directly by the software. Language commands can still be used.

Note:

This option is intended only as a temporary solution.

Related to:

MD26014 \$MC_PUNCH_PATH_SPLITTING

MD26008 \$MC_NIBBLE_PUNCH_CODE[n]

26014	PUNCH_PATH_SPLITTING	C09	N4
-	Activation of automatic path segmentation	DWORD	PowerOn
-			
-	-	2, 2, 2, 2, 2, 2, 2...	- - 7/2 M

Description: Activation data for automatic path segmentation.

Value Significance

0 =

Automatic path segmentation only active with punching and nibbling.

1 =

Automatic path segmentation can also be activated without punching and nibbling functions;

that is, it is programmable and be used NC internally

2 =

Automatic path segmentation can only be used NC internally;

that is it cannot be programmed.

26016	PUNCH_PARTITION_TYPE	C09	N4
-	Behavior of individual axes with automatic path segmentation	DWORD	PowerOn
-			
-	-	1, 0, 0, 0, 0, 0, 0, 0...	- - 7/2 M

Description: This machine data defines how single axes that are also nibbling axes within the meaning of MD26010 \$MC_PUNCHNIB_AXIS_MASK are to behave.

In this case, there are the following options for the behavior of the single axes during automatic path segmentation and stroke control:

PUNCH_PARTITION_TYPE = 0

No special behavior during automatic path segmentation. If the single axes are programmed together with path axes in one block, then their total traversing path is split up corresponding to the path axes. That is the pure geometric relationship between the single axes and path axes is identical to the undivided motion. If the single axes are programmed without the path axes but with SPN=<value>, then the path is divided according to the programmed SPN value.

PUNCH_PARTITION_TYPE = 1

In this case, the path of the single axes, if they are programmed together with path axes, are generally traversed in the first section (that is independently of the currently active type of interpolation).

PUNCH_PARTITION_TYPE = 2

In this case, the single axes behave with linear interpolation in the same way as with PUNCH_PARTITION_TYPE = 1, and with all other types of interpolation in the same way as with PUNCH_PARTITION_TYPE = 0.

Related to:

MD26010 \$MC_PUNCHNIB_AXIS_MASK

26018	NIBBLE_PRE_START_TIME	C09	N4
s	Delay time for nibbling/punching with G603	DOUBLE	PowerOn
-			
-	-	0., 0., 0., 0., 0., 0., 0., 0....	-MD_DBLMAX 1.0E+301 7/2 M

With an interpolation cycle of 5 ms, a stroke shall be released 2 cycles after reaching the interpolation end. In this case, the value 0.010 s must be selected for `NIBBLE_PRE_START_TIME`. If a value that is not integrally divisible by the set interpolation time is selected, then the stroke is initiated in the interpolation cycle following the set time.

Description:	When stroke active signal is set, for example by punch overshoots between the strokes, then the interpolation is stopped. It is also possible to generate the message "unclean punch signal" as a function of machine data NIBBLE_SIGNAL_CHECK.
0:	No error message when the punching signal is irregular
1:	Alarm, when the punching signal is irregular between strokes

Description:	Parameterization of the "basic blocks with absolute values" function Bit 0 = 1 : The position values of the transverse axis are always displayed as diameter values. Transverse axes can be applied using MD20100 \$MC_DIAMETER_AX_DEF or MD30460 \$MA BASE FUNCTION MASK, bit 2.
---------------------	---

Description:	A version information freely available to the user (is indicated in the version screen)
---------------------	--

Description:

The program run time is measured using system variables and can be read out. It provides a means of outputting the current progress of the processing of a part program. This MD can be used to make the following settings on a channel-specific basis:

Bit 0 = 0

\$AC_ACT_PROG_NET_TIME is not deleted on a jump to the start of the program with GOTOS

Bit 0 = 1

\$AC_ACT_PROG_NET_TIME is deleted on a jump to the start of the program with GOTOS, the value is saved in \$AC_OLD_PROG_NET_TIMES, and the program counter \$AC_OLD_PROG_NET_TIME_COUNT is incremented.

Bit 1 = 0

\$AC_ACT_PROG_NET_TIME ceases to be increased if override = 0 is set; in other words, the program run time is measured without the time for which the override was set to 0.

Bit 1 = 1

\$AC_ACT_PROG_NET_TIME is increased if override = 0; in other words, the program run time is measured with the time for which the override was set to 0.

Bits 2 to 31

Reserved

27860	PROCESSTIMER_MODE			C09	K1

MD27882 $MC_PART_COUNTER_MCODE

```

Description: If part counting is activated via MD27880 \$MC_PART_COUNTER, the count pulse can be triggered by a special M command.

Only then are the values defined here taken into account:

Meaning:

The part counters are incremented by 1 in the NST signal output of the M command described, where:

MD27882 \$MC_PART_COUNTER_MCODE[0] for \$AC_TOTAL_PARTS

MD27882 \$MC_PART_COUNTER_MCODE[1] for \$AC_ACTUAL_PARTS

MD27882 \$MC_PART_COUNTER_MCODE[2] for \$AC_SPECIAL_PARTS

Description: With MD27920 \$MC_TIME_LIMIT_NETTO_INT_TASK, the maximum runtime of the interpreter subtask is set. The interpreter subtask is started from the preprocessing task. If the interpreter task does not end on its own within the time set with MD27920 \$MC_TIME_LIMIT_NETTO_INT_TASK, it will be stopped and continued after a preprocessing cycle.

Description: The maximum runtime of the EES async. subtask is set with this machine data. The EES async. subtask is started from the preprocessing task. If the EES async. subtask does not end automatically within the time set in this machine data, it will be stopped and resumed after a preprocessing cycle.

Description:	Definition of the size (in kbyte) of the dynamic memory for the REORG-LOG data. The size of the memory determines the quantity of the data available for the function REORG. References: /FB/, K1, "Mode Groups, Channel, Program Operation"
---------------------	---

28010	MM_NUM_REORG_LUD_MODULES			EXP, C02	V2, K1	
-	Number of blocks for local user variables in REORG (DRAM)			DWORD	PowerOn	
-						
-	-	8, 8, 8, 8, 8, 8, 8, 8...	0	SLMAXNUMBER OF_USERMODULES	7/2	M

Description: Defines the number of additional LUD data blocks available for the function REORG (see Description of Functions, Channels, Mode Groups, Program Operation (K1)).

This value can be 0 if the function REORG is not used. The CNC always opens 12 LUD data blocks, of which 8 are used for NC programs and 4 for the ASUBs.

An LUD data block is needed for each NC program and ASUB in which a local user variable is defined. This value may have to be increased for the function REORG if a large IPO buffer is present and a large number of short NC programs in which LUD variables are defined are active (prepared NC blocks of the programs are located in the IPO buffer).

An LUD data block is needed for each of these programs. The size of the reserved memory is affected by the number of LUDs per NC program and their individual memory requirements. The LUD data blocks are stored in the dynamic memory.

The memory requirement for managing the blocks for local user variables with REORG can be determined as follows:

The size of the LUD blocks depends on the number of active LUDs and their data type. The memory for the LUD blocks is limited by the MD28000 \$MC_MM_REORG_LOG_FILE_MEM (memory size for REORG).

28020	MM_NUM_LUD_NAMES_TOTAL			C02	V2, K1	
-	Number of local user variables (DRAM)			DWORD	PowerOn	
-						
-	-	4000, 4000, 4000, 4000, 4000, 4000, 4000, 4000...	4000	32000	7/3	U

Description: Defines the number of variables for the local user data (LUD) which are permitted to exist in the active sections of the program. Approximately 150 bytes of memory per variable are reserved for the names of the variables and the variable values. The memory required for the variable value is equal to the size of the data type. If the total of the local user variables from the active main program and the related subprograms is larger than the defined limit, the variables which are over the limit are not accepted during execution of the program. Dynamic memory is used for the variable names and variable values.

Overview of the memory used by the data types:

Data type	Memory used
REAL	8 bytes
INT	4 bytes
BOOL	1 byte
CHAR	1 byte
STRING	1 byte per character, 200 characters per string are possible
AXIS	4 bytes
FRAME	400 bytes

28040	MM_LUD_VALUES_MEM			C02	V2, K1	
-	Memory space for local user variables (DRAM)			DWORD	PowerOn	
-						
-	-	250, 250, 250, 250, 250, 250, 250, 250...	250	32000	7/3	U

2.3 NC machine data

Description:

This MD defines the amount of memory space available for LUD variables.

The maximum number of available LUDs is given by one of the limit values of MD28020 \$MC_MM_NUM_LUD_NAMES_TOTAL or MD28040 \$MC_MM_LUD_VALUES_MEM.

It should be remembered that several part programs requiring memory can be open simultaneously in the NCK. The number depends on the type of programming, the program length, and the size of the internal NCK block memory upwards of (MD28060 \$MC_MM_IPO_BUFFER_SIZE, MD28070 \$MC_MM_NUM_BLOCKS_IN_PREP).

Related to:

MD28020 \$MC_MM_NUM_LUD_NAMES_TOTAL
(number of local user variables (DRAM))

28050	MM_NUM_R_PARAM			C02	K1	
-	Number of channel-specific R variables (SRAM)			DWORD	PowerOn	
-						
-	-	100, 100, 100, 100, 100, 100, 100, 100...	0	32535	7/2	M

Description:

Defines the number of R variables available in the channel. This machine data reserves 8 bytes of buffered user memory per R variable.

28060	MM_IPO_BUFFER_SIZE			C02	B1, K1	
-	Number of NC blocks in IPO buffer (DRAM)			DWORD	PowerOn	
-						
-	-	10, 10, 10, 10, 10, 10, 10, 10...	2	1000	7/2	M

Description:

Defines the number of blocks for the interpolation buffer. This buffer contains prepared NC blocks available for the interpolation. A number of kbytes of the dynamic user memory are reserved for each NC block. The data also limits the number of blocks for look ahead consideration of speed limitation for the LookAhead function.

MD28060 \$MC_MM_IPO_BUFFER_SIZE is set by the system.

Related to:

MD28070 \$MC_MM_NUM_BLOCKS_IN_PREP
(number of blocks for block preparation)

28070	MM_NUM_BLOCKS_IN_PREP			EXP, C02	B1, K1	
-	Number of blocks for block preparation (DRAM)			DWORD	PowerOn	
-						
-	-	50, 50, 50, 50, 50, 50, 50, 50...	20	1000	7/2	M

Description:

Defines the number of NC blocks available for NC block preparation. This figure is determined mainly by the system software and is used largely for optimization. Approximately 10 Kbytes of dynamic memory is reserved per NC block.

Related to:

MD28060 \$MC_MM_IPO_BUFFER_SIZE
(number of NC blocks with IPO buffer)

28071	MM_NUM_SURF_LEVELS			EXP, C02	-	
-	Dimensioning of the COMPSURF function (DRAM)			DWORD	PowerOn	
-						
-	-	0, 0, 0, 0, 0, 0, 0, 0...	0	10	7/1	M

Description:

Defines the size of the internal data structures of the COMPSURF function. A larger value means a better surface finish is achieved but also that more CPU time and memory space are required.

With the value 0, the COMPSURF function is not present in a channel, and therefore occupies no memory space.

The machine data only has an effect if the Top Surface option is used.

28072	MM_MAXNUM_SURF_GROUPS	EXP, C02	-

-			
-	-	5, 5, 5, 5, 5, 5, 5, 5...	5 100 7/2 M

Description: Defines the number of predefined user frames. The standard system configuration provides four frames for G54 to G57 and one frame for G500.
The backup data are lost if this machine data is altered!

28081	MM_NUM_BASE_FRAMES	C02	M5, K2
-	Number of base frames (SRAM)	DWORD	PowerOn
-			
-	-	1, 1, 1, 1, 1, 1, 1, 1...	0 16 7/2 M

Description: Number of channel-specific base frames per channel.
The value corresponds to the number of field elements for the predefined field \$P_CHBFR[].
Buffered memory is reserved for this.

28082	MM_SYSTEM_FRAME_MASK	C02	M5, K2, W1
-	System frames (SRAM)	UDWORD	PowerOn
-			
-	-	0x21, 0x21, 0x21, 0x21, 0x21, 0x21, 0x21, 0x21...	0 0x00000FFF 7/2 S

Description: Bit mask for configuring channel-specific system frames included in the channel.

- Bit 0: System frame for setting actual value and scratching
- Bit 1: System frame for external work offset
- Bit 2: System frame for TCARR and PAROT
- Bit 3: System frame for TOROT and TOFRAME

2.3 NC machine data

Bit 4: System frame for workpiece reference points
 Bit 5: System frame for cycles
 Bit 6: System frame for transformations
 Bit 7: System frame \$P_ISO1FR for ISO G51.1 Mirror
 Bit 8: System frame \$P_ISO2FR for ISO G68 2DROT
 Bit 9: System frame \$P_ISO3FR for ISO G68 3DROT
 Bit 10: System frame \$P_ISO4FR for ISO G51 Scale
 Bit 11: System frame \$P_RELFR for relative coordinate systems

28083	MM_SYSTEM_DATAFRAME_MASK			C02	-	
-	System frames (SRAM)			UDWORD	PowerOn	
-						
-	-	0xF9F, 0xF9F, 0xF9F, 0xF9F, 0xF9F, 0xF9F, 0xF9F, 0xF9F...	0	0x00000FFF	7/2	S

Description: Bit mask for configuring channel-specific system frames in the data storage (SRAM).

Bit 0: System frame for setting actual value and scratching
 Bit 1: System frame for external work offset
 Bit 2: System frame for TCARR aund PAROT
 Bit 3: System frame for TOROT and TOFRAME
 Bit 4: System frame for workpiece reference points
 Bit 5: System frame for cycles
 Bit 6: System frame for transformations
 Bit 7: System frame \$P_ISO1FR for ISO G51.1 Mirror
 Bit 8: System frame \$P_ISO2FR for ISO G68 2DROT
 Bit 9: System frame \$P_ISO3FR for ISO G68 3DROT
 Bit 10: System frame \$P_ISO4FR for ISO G51 Scale
 Bit 11: System frame \$P_RELFR for relative coordinate systems

28085	MM_LINK_TOA_UNIT			C02, C09	FBWsl, S7	
-	Assignment of a TO unit to a channel (SRAM)			DWORD	PowerOn	
-						
-	-	1, 2, 3, 4, 5, 6, 7, 8...	1	10	7/2	M

Description: The T0 area covers all tool, magazine, ... data blocks known to the NCK. The maximum number of units in the TO area is equal to the number of channels.

If MD28085 \$MC_MM_LINK_TOA_UNIT = default setting, then each channel is assigned a TO unit individually.

If MD28085 \$MC_MM_LINK_TOA_UNIT = i, the channel is assigned TO unit i. This enables one TO unit to be assigned to multiple channels.

Notice

The upper limit does not indicate that this value is always practical or free of conflicts. If one channel (the first) is active in a system with a maximum of 2 channels, and the other is not, the MD on channel 1 can formally be given the value 2, but the NCK cannot work with it. This setting would mean that channel 1 did not have any blocks for tool offsets, as the channel with ID=2 did not exist.

The NCK detects this conflict at Power On and restart, and responds by autonomously changing the (incorrect) value to the default value of the MD.

28090	MM_NUM_CC_BLOCK_ELEMENTS	EXP, C02	TE1, TE7, TE8, K1
-	Number of block elements for compile cycles (DRAM)	DWORD	PowerOn
-			
-	-	0, 0, 0, 0, 0, 0, 0, 0...	0 64 7/1 M

Description: The input value defines the number of block elements that can be used for compile cycles.
In the case of software version 2, approximately 1.2KB of dynamic memory is required per block element.

28100	MM_NUM_CC_BLOCK_USER_MEM	EXP, C02	TE1, TE7, TE8, K1
-	Size of block memory for compile cycles (DRAM), in KB	DWORD	PowerOn
-			
-	-	0, 0, 0, 0, 0, 0, 0, 0...	0 64000 7/1 M

Description: The value defines the total capacity of block memory available to the user in the dynamic memory area for the compile cycles. The memory is allocated in staggered blocks of 128 bytes.

28105	MM_NUM_CC_HEAP_MEM	EXP, C02	TE7
-	Heap memory in kbytes for compile-cycle applications (DRAM)	DWORD	PowerOn
-			
-	-	0, 0, 0, 0, 0, 0, 0, 0...	0 64000 7/2 M

Description: Size of the heap memory in kbytes which can be used by the compile cycle user.
Dynamic memory is reserved.
The memory is allocated in subdivisions of 128 byte groups.
The start address and the size of the reserved memory is made available via a binding, the management lies in the hands of the CC user.

28150	MM_NUM_VDIVAR_ELEMENTS	C02	A2, P3 pl, P3 sl
-	Number of elements for writing PLC variables	DWORD	PowerOn
-			
-	-	0, 0, 0, 0, 0, 0, 0, 0...	0 32000 7/2 M

Description: The MD defines the number of elements which the user has available for writing PLC variables (\$A_DBx=...). This number also applies to block search, but not to synchronized actions.
The memory requirement is ca. 24 bytes per element.
One element is needed for each write action when writing PLC variables in quick succession.
If more writing actions are to be performed than elements are available, block transport must be guaranteed (trigger preprocessing stop, if required)
However, the number of elements can be reduced if the accessing actions are made separately (block transport has already been accomplished). Writing accesses (var=\$A_DBx) are unlimited.

28160	MM_NUM_LINKVAR_ELEMENTS	C02	B3
-	Number of elements for writing NCU-link variables	DWORD	PowerOn
-			
-	-	0, 0, 0, 0, 0, 0, 0, 0...	0 32000 7/2 M

Description: Defines the number of elements which the user has available for programming link variables (\$A_DLx=...). This number also applies to block search, but not to synchronized actions.
The memory requirement is approx. 24 bytes per element.

2.3 NC machine data

One element is needed for each write action when writing NCU-link variables in quick succession.

However, the number of elements can be reduced if the accessing actions are made separately (block transport has already been accomplished).

If more writing actions are to be performed than elements are available, block transport must be guaranteed (trigger preprocessing stop, if required).

28180	MM_MAX_TRACE_DATAPOINTS			EXP, C02, C06	-	
-	Length of the trace data buffer			DWORD	PowerOn	
NBUP						
-	-	100, 100, 100, 100, 100, 100, 100, 100...	0	20000	2/2	M

Description: MM_MAX_TRACE_DATAPOINTS defines the size of an internal data buffer which contains the trace recordings.

28200	MM_NUM_PROTECT_AREA_CHAN			C02, C06, C09	A3	
-	Number of channel-specific protection zones (SRAM)			DWORD	PowerOn	
-						
-	-	0, 0, 0, 0, 0, 0, 0, 0...	0	10	7/2	M

Description: This machine data defines how many channel-specific protection areas are set up.

Related to:

MD28210 \$MC_MM_NUM_PROTECT_AREA_ACTIVE (number of simultaneously active protection areas)

MD18190 \$MN_MM_NUM_PROTECT_AREA_NCK (number of control-specific protection areas (SRAM))

References:

/FB/, A3, "Axis/Contour Tunnel Monitoring, Protection Areas"

28210	MM_NUM_PROTECT_AREA_ACTIVE			C11, C02, C06, C09	A3	
-	Number of simultaneously active protection zones in one channel			DWORD	PowerOn	
-						
-	-	0, 0, 0, 0, 0, 0, 0, 0...	0	20	7/2	M

Description: This machine data defines the number of protection areas that may be activated simultaneously for each channel.

It is not practical to enter a numerical value greater than MD18190 \$MN_MM_NUM_PROTECT_AREA_NCK + MD28200 \$MC_MM_NUM_PROTECT_AREA_CHAN.

Related to:

MD28200 \$MC_MM_NUM_PROTECT_AREA_CHAN (Number of blocks for channel-specific protection areas)

MD18190 \$MN_MM_NUM_PROTECT_AREA_NCK (Number of control-specific protection areas (SRAM))

References:

/FB1/ Function Manual Basic Functions; Axis Monitoring, Protection Areas (A3)

28212	MM_NUM_PROTECT_AREA_CONTOUR			C11, C02, C06, C09	A3	
-	Elements for active protection zones (DRAM)			DWORD	PowerOn	
-						
-	-	30, 30, 30, 30, 30, 30, 30, 30...	0	50	7/2	M

Description: This machine data defines for each channel how many internal contour elements in total are held available for active protection zones.
 Dynamic memory is used.
 The MD affects the memory requirements for the activated protection zones.
 This machine data is active only if MD28210 \$MC_MM_NUM_PROTECT_AREA_ACTIVE is not equal to 0.

28240	MM_NUM_SYNC_DIAG_ELEMENTS	N05, C02	-
-	Number of diagnostic elements for expressions in synchronized actions	DWORD	PowerOn
-			
-	-	0, 0, 0, 0, 0, 0, 0, 0...	0 32000 7/2 M

Description: The values of the variables and machine data during diagnostics of the motion-synchronous actions are saved to memory elements for storage in the control. A motion-synchronous action uses up to the number of elements for as many variables as are set with MD28241 \$MC_MAXNUM_SYNC_DIAG_VAR.
 The following are assigned:

- 1 element for each variable
- 1 element for each index

Example:
 WHEN \$R1 == 1 DO \$R2 = \$R[AC_MARKER[1]]
 R1 = 2 elements, variable with written value 1 element, index "1" an element
 R2 = 2 elements, variable with written value 1 Element, index "2" an element
 AC_MARKER = 2 elements, variable with read value 1 element, index "1" an element
 R = 2 elements, variable with written value 1 element, index "1" an element
 Total 8 elements.

28241	MAXNUM_SYNC_DIAG_VAR	N05	-
-	Maximum number of diagnostics variables per synchronized action	DWORD	PowerOn
-			
-	-	0, 0, 0, 0, 0, 0, 0, 0...	0 10000 7/2 M

Description: Maximum number of diagnostics variables per synchronized action.

28250	MM_NUM_SYNC_ELEMENTS	C02	2.8, 6.1
-	Number of elements for expressions in synchronized actions	DWORD	PowerOn
-			
-	-	159, 159, 159, 159, 159, 159, 159, 159...	0 32000 7/2 M

Description: The expressions of the motion-synchronous actions are stored in memory elements in the control. A motion-synchronous action occupies at least 4 elements.
 It occupies:

- 1 element for each operand in the condition
- >= 1 element for each action
- 2 elements for each assignment
- 1 element for each further operand in complex expressions.

One element occupies approx. 64 bytes.
 The option "Synchronous actions stage 2" is required if the MD can be written to.

2.3 NC machine data

28251	MM_NUM_SAFE_SYNC_ELEMENTS	C02	-
-	Number of elements for expressions in Safety synchr. actions	DWORD	PowerOn
-			
-	-	0, 0, 0, 0, 0, 0, 0, 0...	0 32000 7/2 M

Description: The expressions of motion-synchronous actions are stored in memory elements of the control. A motion-synchronous action assigns at least 4 elements.

Assignments:

Each operand in the condition: 1 element

Each action: ≥ 1 element

Each assignment: 2 elements

Each additional operand in complex expressions: 1 element

Also see:

MD28250 \$MC_MM_NUM_SYNC_ELEMENTS

28252	MM_NUM_FCTDEF_ELEMENTS	C02	2.4, 2.8, 6.1
-	Number of FCTDEF elements	DWORD	PowerOn
-			
-	-	3, 3, 3, 3, 3, 3, 3, 3...	0 100 7/2 M

Description: Defines the number of FCTDEF elements.

28253	MM_NUM_SYNC_STRINGS	C02	-
-	Number of strings for expressions in synchronized actions	DWORD	PowerOn
-			
-	-	200, 200, 200, 200, 200, 200, 200, 200...	0 32000 7/2 M

Description: The expressions of motion-synchronous actions are saved in memory elements for storage in the control. Elements have to be reserved specifically for strings within expressions.

28254	MM_NUM_AC_PARAM	C02	-
-	Dimension of \$AC_PARAM.	DWORD	PowerOn
-			
-	-	50, 50, 50, 50, 50, 50, 50, 50...	0 20000 7/2 M

Description: Panel size of \$AC_PARAM.

28255	MM_BUFFERED_AC_PARAM	C02	2.3, 6.1
-	\$AC_PARAM[] is stored in SRAM.	DWORD	PowerOn
-			
-	-	0, 0, 0, 0, 0, 0, 0, 0...	0 1 7/2 M

Description: \$AC_PARAM[] is stored in SRAM.

28256	MM_NUM_AC_MARKER	C02	2.3, 6.1
-	Dimension of \$AC_MARKER	DWORD	PowerOn
-			
-	-	8, 8, 8, 8, 8, 8, 8, 8...	0 20000 7/2 M

Description: Number of channel-specific markers \$AC_MARKER for motion-synchronous actions.
DRAM or SRAM is required depending on MD28257 \$MC_MM_BUFFERED_AC_MARKER.

28257	MM_BUFFERED_AC_MARKER	C02	2.3, 6.1
-	\$AC_MARKER[] is stored in SRAM.	DWORD	PowerOn
-			
-	-	0, 0, 0, 0, 0, 0, 0, 0...	0 1 7/2 M

Description: \$AC_MARKER[] is stored in SRAM.

28258	MM_NUM_AC_TIMER	C02	2.3, 2.4, 6.1
-	Number of time variables \$AC_TIMER (DRAM)	DWORD	PowerOn
-			
-	-	0, 0, 0, 0, 0, 0, 0, 0...	0 10000 7/2 M

Description: Number of channel-specific time variables \$AC_TIMER for motion-synchronous actions (DRAM)

28260	NUM_AC_FIFO	C01	2.3, 2.4, 6.1
-	Number of FIFO variable for synchronized actions	DWORD	PowerOn
-			
-	-	0, 0, 0, 0, 0, 0, 0, 0...	0 10 7/2 M

Description: Number of FIFO variables \$AC_FIFO1 - \$AC_FIFO10 for motion-synchronous actions.

FIFO variables are used for product tracking. A piece of information (e.g. the product length) for each part on a conveyor belt can be temporarily stored in each FIFO variable.

FIFO variables are stored in R variables.

MD28262 \$MC_START_AC_FIFO defines the number of the R variable as from which the FIFO variables can be stored. All R variables with lower numbers can be used freely in the part program.

R variables above the FIFO range cannot be written from the part program.

The number of R variables must set via MD28050 \$MC_MM_NUM_R_PARAM so that all FIFO variables can be accommodated from the start of the R variables:

$$MD28050 \$MC_MM_NUM_R_PARAM = MD28262 \$MC_START_AC_FIFO + MD28260 \$MC_NUM_AC_FIFO * (MD28264 \$MC_LEN_AC_FIFO + 6)$$

The FIFO variables bear the names \$AC_FIFO1 to \$AC_FIFO_n.

They are stored as arrays.

The indices 0 - 5 have special meanings:

n= 0:

A new value is stored in the FIFO when writing with index 0.

The oldest element is read and removed from the FIFO when writing with index 0.

n=1: Access to the first element read in

n=2: Access to the last element 1 read in

n=3: Sum of all FIFO elements

n=4: Number of elements available in the FIFO

n=5: Current write index relative to FIFO start

n=6: 1st element read in

28262	START_AC_FIFO	C01	2.3, 2.4, 6.1
-	FIFO variables store from R variable	DWORD	PowerOn
-			
-	-	0, 0, 0, 0, 0, 0, 0, 0...	0 32535 7/2 M

Description: Number of the R variable as from which FIFO variables are stored. All R variables with lower numbers can be used freely in the part program. R variables above the FIFO range cannot be written from the part program.

2.3 NC machine data

The number of R variables must set via MD28050 \$MC_MM_NUM_R_PARAM so that all FIFO variables can be accommodated from the start of the R variables:

```
MD28050 $MC_MM_NUM_R_PARAM = MD28262 $MC_START_AC_FIFO + MD28260 $MC_NUM_AC_FIFO
* (MD28264 $MC_LEN_AC_FIFO + 6)
```

The FIFO variables bear the names \$AC_FIFO1 to \$AC_FIFO_n. They are stored as arrays. The indices 0 - 5 have special meanings:

n= 0:

A new value is stored in the FIFO when writing with index 0.

The oldest element is read and removed from the FIFO when reading with index 0.

n=1: Access to the first element read in

n=2: Access to the last element read in

n=3: Sum of all FIFO elements

n=4: Number of elements available in the FIFO

n=5: Current write index relative to FIFO start

Related to:

MD28260 \$MC_NUM_AC_FIFO

28264	LEN_AC_FIFO	C01	2.3, 2.4, 6.1, M5
-	Length of FIFO variables \$AC_FIFO1-\$AC_FIFO10	DWORD	PowerOn
-			
-	-	0, 0, 0, 0, 0, 0, 0, 0...	0 32535 7/2 M

Description: Length of the FIFO variables \$AC_FIFO1 to \$AC_FIFO10.
All FIFO variables are the same length.

28266	MODE_AC_FIFO	C01	2.3, 2.4, 6.1
-	Mode of FIFO processing	BYTE	PowerOn
-			
-	-	0, 0, 0, 0, 0, 0, 0, 0...	0 - 7/2 M

Description: Mode of FIFO processing:
Bit 0 = 1:
The sum of all FIFO contents is updated at each write access.
Bit 0 = 0:
No summation
Related to:
MD28260 \$MC_NUM_AC_FIFO

28274	MM_NUM_AC_SYSTEM_PARAM	EXP, C02	-
-	Number of \$AC_SYSTEM_PARAM for motion-synchronous actions	DWORD	PowerOn
-			
-	-	0, 0, 0, 0, 0, 0, 0, 0...	0 20000 7/2 M

Description: Number of \$AC_SYSTEM_PARAM parameters for motion-synchronous actions.
Depending on MD28255 \$MC_MM_BUFFERED_AC_PARAM, DRAM or SRAM is required.
Reserved for SIEMENS applications.

28276	MM_NUM_AC_SYSTEM_MARKER	EXP, C02	-
-	Number of \$AC_SYSTEM_MARKER for motion-synchronous actions	DWORD	PowerOn
-			
-	-	0, 0, 0, 0, 0, 0, 0, 0...	0 20000 7/2 M

Description: Number of \$AC_SYSTEM_MARKER markers for motion-synchronous actions.
Depending on MD28257 \$MC_MM_BUFFERED_AC_MARKER, DRAM or SRAM is required.
Reserved for SIEMENS applications.

28290	MM_SHAPED_TOOLS_ENABLE			C01, C08, C02	-	
-	Enable tool radius compensation for contour tools			BOOLEAN	PowerOn	
-						
-	-	FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE...	0	-	7/2	M

Description: The function "Tool radius compensation for contour tools" is enabled with this tool.

28291	MM_SMOOTH_SURFACE_NORMALS			C01, C08, C02	-	
-	Enable interpolation of the surface normals via polynomials.			BOOLEAN	PowerOn	
-						
-	-	FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE...	0	-	7/2	M

Description: This machine data enables the handling of surface normals with polynomials. It is needed, among other things, for smoothing the surface normals with the COMPSURF function.

28300	MM_PROTOD_USER_ACTIVE			C02	-	
-	Activation of logging for a user			BOOLEAN	PowerOn	
-						
-	10	TRUE, TRUE, FALSE, FALSE, FALSE, TRUE, TRUE, FALSE,, T...	0	-	1/1	M

Description: Activation of recording for a user.
Users 0 and 1, and 5 to 9 are reserved for system functions.
Users 2, 3 and 4 can be used by OEM.
The individual values concern the users of the log function, the values are assigned to the following functions:
0: Reserved for system functions: simultaneous recording, simulation, synchronized action analysis
1: Reserved for system functions: determining program runtimes, multistep editor
2: Reserved for OEM applications
3: Reserved for OEM applications
4: Reserved for OEM applications
5: Reserved for system functions: Trace
6: Reserved for system functions: Trace
7: Reserved for system functions: Trace
8: Reserved for system functions: Trace
9: Reserved for system functions: Action log

Description:	Number of OEM event types in OPI module ETP. The individual values concern the users of the log function, which are assigned to the following functions: 0: Reserved for system functions: simultaneous recording, simulation, synchronized action analysis 1: Reserved for system functions: determining program runtimes, multistep editor 2: Reserved for OEM applications 3: Reserved for OEM applications 4: Reserved for OEM applications 5: Reserved for system functions: Trace 6: Reserved for system functions: Trace 7: Reserved for system functions: Trace 8: Reserved for system functions: Trace 9: Reserved for system functions: Action log
---------------------	--

Description:	Number of standard event types required in the ETP OPI block.
	The individual values concern the users of the log function, which are assigned to the following functions:
	0: Reserved for system functions: simultaneous recording, simulation, synchronized action analysis
	1: Reserved for system functions: determining program runtimes, multistep editor
	2: Reserved for OEM applications
	3: Reserved for OEM applications
	4: Reserved for OEM applications
	5: Reserved for system functions: Trace
	6: Reserved for system functions: Trace
	7: Reserved for system functions: Trace
	8: Reserved for system functions: Trace
	9: Reserved for system functions: Action log

Description:	Value:
	0: Basic blocks with absolute values deactivated.
	1: Basic blocks with absolute values activated;
	A display buffer of the following size is created:

(MD28257 \$MC_MM_BUFFERED_AC_MARKER + MD28070 \$MC_MM_NUM_BLOCKS_IN_PREP) * 256 bytes

>= 128: Basic blocks with absolute values activated.

A display buffer of the following size is created:

(MD28060 \$MC_MM_IPO_BUFFER_SIZE + MD28070 \$MC_MM_NUM_BLOCKS_IN_PREP) * <value>

28402	MM_ABSBLOCK_BUFFER_CONF			EXP, C02	K1	
-	Setting of upload buffer size			DWORD	PowerOn	
-						
-	2	2, 4, 2, 4, 2, 4, 2, 4, 2, 4, 2, 4, 2, 4, 2, 4...	0	32000	7/2	M

Description:

Dimensioning the size of the upload buffer:

MD28402 \$MC_MM_ABSBLOCK_BUFFER_CONF[0] : Number of blocks before the current block

MD28402 \$MC_MM_ABSBLOCK_BUFFER_CONF[1] : Number of blocks after the current block

The machine data is tested for the following upper / lower limits during startup:

0 <= MD28402 \$MC_MM_ABSBLOCK_BUFFER_CONF[0] <= 8

0 <= MD28402 \$MC_MM_ABSBLOCK_BUFFER_CONF[1] <= (MD28060 \$MC_MM_IPO_BUFFER_SIZE + MD28070 \$MC_MM_NUM_BLOCKS_IN_PREP)

Alarm 4152 is issued when the limits are violated.

28450	MM_TOOL_DATA_CHG_BUFF_SIZE			, C02, C06	-	
-	Buffer for tool data changes (DRAM)			DWORD	PowerOn	
-						
-	-	400, 400, 400, 400, 400. 400. 400. 400...	0	2500	7/2	M

Description:

Number of entries in the buffer for the OPI change service for tool data.

Dynamic memory is used.

This buffer is created only if bit 2 or bit 3 is set in MD17530

\$MN_TOOL_DATA_CHANGE_COUNTER.

28520	MM_MAX_AXISPOLY_PER_BLOCK			C02	B1	
-	Maximal number of axial polynomials per block			DWORD	PowerOn	
-						
-	-	3, 3, 3, 3, 3, 3, 3, 3...	1	15	7/2	M

Description:

Maximum number of axis polynomials which can be contained in a block.

In the standard case, each block contains only one polynomial per axis, i.e. this data can be set to 1 immediately.

More polynomials are required in the following cases:

This data must have a value of at least 3 for smoothing with G642 to G645.

A value of 5 is recommended if COMPCAD (Advanced Surface) is used.

A value of 15 is recommended if COMPSURF is used.

28530	MM_PATH_VELO_SEGMENTS			C02	A2, B1	
-	Number of memory elements for path velocity limitation			DWORD	PowerOn	
-						
-	-	0, 0, 0, 0, 0, 0, 0, 0...	0	100	7/2	M

Description:

Number of memory elements available for limiting the path velocity and changing it in the block.

0 : Each block is limited by a maximum path velocity.

> 0 : If required, a profile of the permissible path velocity
; and its modification options is generated and monitored

2.3 NC machine data

```

; in the block.
; This results in a smoother axis velocity progression and
; a shorter travel time.
; MD28530 $MC_MM_PATH_VELO_SEGMENTS defines the average
; number of segments available in the block.
; The necessary setting essentially depends
; on the requirements.

```

The following values are recommended:

```

3:   for G643 and G644, if only geometry axes are traversed
5:   for G643 and G644, if geometry and rotary axes are traversed
5:   for COMPCAD
5:   for dyn. transformation
8:   for COMPSURF

```

A value that is too low may lead to additional velocity limitations if a sufficient number of blocks cannot be made available for interpolation.

MD28530 \$MC_MM_PATH_VELO_SEGMENTS additionally increases the memory requirement of dyn. Look Ahead. Values higher than 8 are only practical in exceptional cases.

3 ... 8 :

Recommended setting.

28533	MM_LOOKAH_FFORM_UNITS	C02	-
-	Memory for extended LookAhead	DWORD	PowerOn
-			
-	-	0, 0, 0, 0, 0, 0, 0, 0...	0
		100000	7/2
			M

Description:

The machine data is used to configure the work memory for extended LookAhead.

The MD scales the value defined internally through MD28060 \$MC_MM_IPO_BUFFER_SIZE, MD28520 \$MC_MM_MAX_AXISPOLY_PER_BLOCK, MD28530 \$MC_MM_PATH_VELO_SEGMENTS, MD28535 \$MC_MM_FEED_PROFILE_SEGMENTS, MD28540 \$MC_MM_ARCLENGTH_SEGMENTS).

Its practical size depends on the part program, the block lengths, the axis dynamics, and an active kinematic transformation.

The MD should only be set for those channels in which free-form surfaces are also machined.

0 : default LookAhead is active.

> 0 : extended LookAhead is active if switched on by MD20443 \$MC_LOOKAH_FFORM.

The set value for free-form surface applications is: 18.

28535	MM_FEED_PROFILE_SEGMENTS	C02	-
-	Number of memory element for feed profiles	DWORD	PowerOn
-			
-	-	1, 1, 1, 1, 1, 1, 1, 1...	1
		10	7/2
			M

Description:

Number of memory elements available for feed profile per block.

The default value 1 is adequate for a programmable feed profile (FLIN, FCUB, FPO()).

If compile cycle applications require more segments per block, this machine data must be increased accordingly.

If, for example, a feed profile is to be activated in which there is deceleration at both the beginning and the end of the block, 3 segments will be required for the feed profile in the block, i.e. this MD must have value 3.

28540	MM_ARCLENGTH_SEGMENTS	C02	B1
-	Number of memory elements for arc length function representation	DWORD	PowerOn
-			
-	-	0, 0, 0, 0, 0, 0, 0, 0...	0 100 7/2 M

Description: Number of memory elements available for the arc length function for parameterizing polynomials.

If this machine data is equal to zero, a fixed interval division is used to represent the arc length function. In this case, the calculated function is only tangent-continuous. This can lead to discontinuities in the axis accelerations.

If the function G643 or G644 is used for smoothing and/or COMPCAD or COMPSURF, this MD should be assigned a value of at least 10. In this case, the function also has a constant curvature which results in a smoother progression of the path velocity, as well as the axis velocities and accelerations.

A value of 10 is sufficient when using COMPSURF and 3-axis applications.

Up to 20 may be useful for COMPSURF and 5-axis applications.

Not only the value of MD28540 \$MC_MM_ARCLENGTH_SEGMENTS but also that of MD20262 \$MC_SPLINE_FEED_PRECISION are crucial for accuracy.

28560	MM_SEARCH_RUN_RESTORE_MODE	C02	K2
-	Data restore after simulation	UDWORD	PowerOn
-			
-	-	0x0, 0x0, 0x0, 0x0, 0x0, 0x0, 0x0, 0x0...	0 0x00000001 7/2 M

Description: Bit mask to restore data after cancellation of a simulated program execution. The following applies:

Bit 0: All frames in the data storage are restored.

28580	MM_ORIPATH_CONFIG	C02	-
-	Setting for ORIPATH path-relative orientation	BYTE	PowerOn
-			
-	-	0, 0, 0, 0, 0, 0, 0, 0...	0 1 1/1 M

Description: This MD is used to configure the behavior with ORIPATH, that is path-relative interpolation of the tool orientation. Furthermore, orientation smoothing is enabled with the G codes OSD or OST.

The following options are available:

0: MD21094 \$MC_ORIPATH_MODE has no effect. G codes OSD and OST have no effect.

1: The "genuine" path-relative orientation interpolation can be activated with MD21094 \$MC_ORIPATH_MODE = 1. The reference of the tool orientation to the path tangent and to the vector normal to the surface programmed with LEAD/TILT is retained throughout the block.

Note:

Alarm 10980 is output if ORIPATH is programmed with MD21094 \$MC_ORIPATH_MODE = 1 or OSD or OST without MD28580 \$MC_MM_ORIPATH_CONFIG = 1.

28590	MM_ORISON_BLOCKS	C02	-
-	Setting for orientation smoothing	DWORD	PowerOn
-			
-	-	0, 0, 0, 0, 0, 0, 0, 0...	0 1000 1/1 M

Description: This MD is used to activate and reserve memory for the function "orientation smoothing with ORISON". If this data has a value of "zero", no orientation smoothing will be possible.

2.3 NC machine data

The value of this machine data indicates the maximum number of blocks over which the orientation is smoothed. The value of this MD should be at least high enough that the blocks to be averaged fit in the buffer. This is dependent upon the maximum set tolerance and the average distance traversed by the programmed blocks or the length of the part blocks generated (see MD20476 \$MC_ORISON_STEP_LENGTH).

.Setting this MD to higher values will significantly increase the memory requirement in the DRAM.

A value of 4 should be entered as a minimum.

If this MD is < 4 and if G code ORISON is programmed, alarm 10982 will be displayed.

28592	MM_NUM_SINGULARITY_BLOCKS			C02	-	
-	Number of blocks for singularity handling. (DRAM)			DWORD	PowerOn	
-						
-	-	0, 0, 0, 0, 0, 0, 0, 0...	0	1	1/1	M

Description: The "Singularity handling" function is activated with this MD, and memory is reserved for it. If this data has the value "zero", singularity handling is not possible.

28600	MM_NUM_WORKAREA_CS_GROUPS			C02	-	
-	Number of coordinate system-specific operating range limits			DWORD	PowerOn	
-						
-	-	0, 0, 0, 0, 0, 0, 0, 0...	0	10	7/2	M

Description: Number of data sets in the channel that are created for coordinate system-specific operating range limits.

It indicates the maximum value of the 1st index of system variable \$P_WORKAREA_CS... [WALimNo, Ax]. It furthermore defines the number of the programmable G functions "WALCS1, WALCS2, ... WALCS10" as well as the maximum value of the system variable \$AC_WORKAREA_CS_GROUP".

= 0: Function "Monitoring of coordinate system-specific operating range limits" cannot be activated.

28610	MM_PREPDYN_BLOCKS			C02	-	
-	Number of blocks for velocity preparation			BYTE	PowerOn	
-						
-	-	0, 0, 0, 0, 0, 0, 0, 0...	0	30	1/1	M

Description: This MD is used to define the number of blocks that are considered when defining the path velocity (velocity preparation). If the value of this MD is zero, only the relevant axis motions are considered in this block in order to define the maximum path velocity of a block. If the geometry in adjacent blocks is also considered when defining the path velocity, the path velocity will be more homogenous.

28620	MM_NUM_FEATURE_BLOCKS			C02	W1	
-	No. blocks for look-ahead characteristic recognition e.g. slot recognition.			DWORD	PowerOn	
-						
-	-	0, 0, 0, 0, 0, 0, 0, 0...	0	20	7/2	M

Description: Indicates the minimum number of blocks that are considered simultaneously for characteristic recognition.

2.3.3 Axis-specific machine data

30110	CTRLOUT_MODULE_NR			A01, A11	G2, S9	
-	Setpoint assignment: module number			BYTE	PowerOn	
-						
-	1	1, 2, 3, 4, 5, 6, 7, 8...	1	31	7/2	M

Description: In this MD, enter the number of the module within a bus segment through which the output is addressed.

For an axis on the PROFIBUS/PROFINET, the logical I/O address from MD13050 \$MN_DRIVE_LOGIC_ADDRESS[index] is assigned by entering index+1 in MD30110 \$MA_CTRLOUT_MODULE_NR.

30120	CTRLOUT_NR			EXP, A01	G2	
-	Setpoint assignment: Setpoint output on drive submodule/module			BYTE	PowerOn	
-						
-	1	1, 1, 1, 1, 1, 1, 1...	1	3	2/2	M

Description: Number of the output on a module which is used to address the setpoint output.
The value is always 1 for modular drives.

30130	CTRLOUT_TYPE			A01, A11	G2, M3, S9	
-	Output type of setpoint			BYTE	PowerOn	
-						
-	1	0	0	3	7/2	M

Description: The type of speed setpoint output is entered into this MD:

- 0: Simulation (no HW required)
- 1: Setpoint output active (differentiation via hardware configuration)
- 2: Semi servo -only when the hardware is available onboard
- 3: Reserved
- 4: Reserved

Note: instead of value 4, MD30132 \$MA_IS_VIRTUAL_AX should now be used.

30132	IS_VIRTUAL_AX			A01	M3, TE1, TE3	
-	Axis is a virtual axis			BOOLEAN	PowerOn	
CTEQ						
-	1	FALSE	0	-	7/2	M

Description: Virtual axis. An axis that is also interpolated in follow-up mode. (Electronic transfer technology; virtual and real master values.)

This MD is the successor to MD30130 \$MA_CTRLOUT_TYPE=4. MD30130 \$MA_CTRLOUT_TYPE=0 and MD30132 \$MA_IS_VIRTUAL_AX=1 must now be used instead of MD30130 \$MA_CTRLOUT_TYPE=4.

Related to:
MD30130 \$MA_CTRLOUT_TYPE

30134	IS_UNIPOLAR_OUTPUT			A01	G2	
-	Setpoint output is unipolar			BYTE	PowerOn	
-						
-	1	0	0	2	7/2	M

Description: Only for PROFIdrive, special application of analog additional drives:
Unipolar output driver (for unipolar analog drive actuator):

2.3 NC machine data

Only positive set speeds are supplied to the drive, the sign of the set speed is separately output in its own digital control signal.

Input value "0":

Bipolar output with pos./neg. set speed (this is the normal case)

Input value "1":

0. Digital bit = servo enable

1. Digital bit = neg. direction of travel

Input value "2": (linking of enable and direction of travel signals):

0. Digital bit = servo enable pos. direction of travel

1. Digital bit = servo enable neg. direction of travel

30200	NUM_ENCS			A01, A02	G2, R1, Z1	
-	Number of encoders			BYTE	PowerOn	
-						
-	-	1	0	2	7/2	M

Description: The number of encoders of the axis or spindle is to be entered in the MD for actual position value sensing (the differentiation between direct and indirect measuring systems, i.e. the locations at which these encoders are installed, is then specified, for example, in MD31040 \$MA_ENC_IS_DIRECT).

For simulation axes/spindles, MD30200 \$MA_NUM_ENCS > 0 must be specified for referencing.

30220	ENC_MODULE_NR			A01, A02, A11	G2	
-	Actual value assignment: Drive number/measuring circuit number			BYTE	PowerOn	
-						
-	2	1, 1, 2, 2, 3, 3, 4, 4, 5, 5, 6, 6, 7, 7, 8, 8...	1	31	7/2	M

Description: For an axis on the PROFIBUS/PROFINET, the logical I/O address from MD13050 \$MN_DRIVE_LOGIC_ADDRESS[index] is assigned by entering index+1 in MD30220 \$MA_ENC_MODULE_NR.

The index[n] of the machine data has the following coding:

[Encoder no.]: 0 or 1

Related to:

MD30110 \$MA_CTRLOUT_MODULE_NR (setpoint assignment)

30230	ENC_INPUT_NR			A01, A02, A11	G2, S9	
-	Actual value assignm.: Input on drive module/meas. circuit board			BYTE	PowerOn	
-						
-	2	1, 2, 1, 2, 1, 2, 1, 2, 1, 2, 1, 2, 1, 2...	1	2	7/2	M

Description: For PROFIdrive:

Number of the encoder within the PROFIdrive message frame through which the encoder is addressed.

For example telegram 103: 1 (=G1_ZSW etc.) or 2 (=G2_ZSW etc.).

The index[n] of the machine data has the following coding:

[Encoder no.]: 0 or 1

If an input is selected, to which no encoder is connected, alarm 300008 "Measuring circuit not available on drive" is output.

30240	ENC_TYPE			A01, A02, A11	A3,, G2, R1	
-	Encoder type of actual value acquisition (actual position value).			BYTE	PowerOn	
-						
-	2	0, 0	0	5	7/2	M

Description:

Encoder type:

- 0: Simulation
- 1: Raw signal encoder (high resolution)
- 2: Square-wave encoder - only when the onboard hardware is available
- 3: Encoder for semi servo - only when the onboard hardware is available
- 4: General absolute encoders (e.g. EnDat interface)
- 5: Reserved

Corresponds with

PROFIdrive parameter P979 (refer there)

30242	ENC_IS_INDEPENDENT			A02, A11	G2, R1	
-	Encoder is independent			BYTE	NEW CONF	
-						
-	2	0, 0	0	3	7/2	M

Description:

If actual value corrections performed by the NC on the encoder selected for position control are not to influence the actual value of any other encoder defined in the same axis, then the position control encoder must be declared to be "independent".

Actual value corrections include the following:

- Modulo treatment,
- Reference point approach,
- Measuring system calibration,
- PRESET

Example:

MD30200 \$MA_NUM_ENCS[AX1] = 2

MD30242 \$MA_ENC_IS_INDEPENDENT[0, AX1] = 0

MD30242 \$MA_ENC_IS_INDEPENDENT[1, AX1] = 1

When the VDI interface has selected the first encoder for position control, the above mentioned actual value corrections will be executed on this encoder only.

When the VDI interface has selected the second encoder for position control, the above mentioned actual value corrections will be executed on both encoders.

The machine data is therefore only valid for encoders that have not been selected by the VDI interface for position control (passive encoders).

As from SW5, the scope of functions has been extended:

MD30242 \$MA_ENC_IS_INDEPENDENT = 2

The passive encoder is dependent. The active encoder changes the actual encoder value. In combination with MD34102 \$MA_REFP_SYNC_ENCS = 1, the passive encoder is adjusted to the active encoder during reference point approach, but is NOT referenced.

In reference mode MD34200 \$MA_ENC_REFP_MODE = 3 (distance-coded reference marks), the passive encoder is automatically referenced with the next traversing movement after zero mark distance overtravel. This is done independently of the current mode setting.

MD30242 \$MA_ENC_IS_INDEPENDENT = 3

In contrast to MD30242 \$MA_ENC_IS_INDEPENDENT = 1, modulo actual value corrections are executed in the passive encoder of modulo rotary axes.

2.3 NC machine data

30244	ENC_MEAS_TYPE	A01, A02, A11	-
-	Encoder measurement type	BYTE	PowerOn
-			
-	2	1, 1	0 1 7/2 M

Description:

For PROFIdrive only:

In combination with the MD13210 \$MN_MEAS_TYPE = 1 (decentralized measurement), this MD can be used to set the type of axial measuring function for drives.

Encoder measurement type:

0: encoder measurement type central (global) measurement

1: encoder measurement type decentral (local) measurement

MEAS_TYPE ENC_MEAS_TYPE measuring sensor input used

0 0 central

0 1 central

1 0 central

1 1 decentralized

30250	ACT_POS_ABS	EXP, A02, A08	R1
-	Internal encoder position	DOUBLE	PowerOn
ODLD, -, -			
-	2	0.0, 0.0	-MD_DBLMAX 1.0E+301 7/2 I

Description:

The actual position (hardware counter status only without machine reference) is stored (in internal format display) in this MD.

At power ON (or encoder activation), it acts with:

- Absolute encoders:

To restore the current position (in combination with the position, possibly with several meanings, buffered in the encoder).

- Incremental encoders:

To buffer the actual value beyond power OFF when the functionality is activated MD34210 \$MA_ENC_REFP_STATE = 1 or. 2 (i.e. as a reference point replacement).

To buffer the actual value beyond power OFF when the functionality is activated MD34210 \$MA_ENC_REFP_STATE = 3 (i.e. as a restored position value).

Note:

This MD is changed internally by the control during traversing movements. Loading a previously saved MD data block can therefore destroy the encoder calibration (machine position reference) of absolute encoders.

For software conversions, we recommend removing the MD data block from the old software release prior to conversion and reloading it into the new software release without moving any axis in the meantime. Protection level 1 should be set for SW 3.6; protection level 2 suffices for SW 4 and higher. The encoder calibration must be explicitly verified (controlled, calibrated) after the software conversion.

30260	ABS_INC_RATIO	EXP, A01, A02	-
-	Absolute encoder: Ratio of absolute to incremental resolution	DWORD	PowerOn
-			
-	2	4, 4	0 - 7/2 M

Description:

Absolute track resolution in relation to the incremental track resolution.

This MD only applies for absolute encoders:

- PROFIBUS drives:

Absolute information XIST2 related to incremental information XIST1.

In the case of plausible drive parameters (e.g. in PROFIdrive parameter P979) the value of this MD is automatically calculated and updated from drive parameters (if parameter read-out has not been deactivated with MD13070 \$MN_DRIVE_FUNCTION_MASK, bit2)

Implausible drive parameters (e.g. multiplication of absolute track higher than that of the incremental track) are rejected and replaced by the value entered in the current MD.

Implausible input values in the current MD (e.g. value=0) are reset to the default value. In addition, alarm 26025 or 26002 is output to inform the user accordingly.

If MD31700 \$MA_ENC_EDS_ACTIVE = 1, this machine data has no function and is replaced by MD31730 \$MA_ABS_INC_RATIO_EDS.

Related to:

MD31700 \$MA_ENC_EDS_ACTIVE

MD31730 \$MA_ABS_INC_RATIO_EDS

30270	ENC_ABS_BUFFERING			EXP, A01, A02	R1	
-	Absolute encoder: Traversing range extension			BYTE	PowerOn	
-						
-	2	0, 0	0	1	7/2	M

Description:

This MD defines the way in which the absolute encoder position is buffered, and whether a traversing range extension is active in the software (exceeding the limits of the absolute encoder range that can be displayed on the hardware).

"0" = standard = traversing range extension (compare ACT_POS_ABS) is active.

"1" = traversing range extension in the software is inactive.

When using an absolute linear scale, there will not be a traversing range overflow for mechanical reasons. This MD is therefore only valid for rotary absolute encoders.

For rotary absolute encoders, the traversing range that can be clearly displayed on the encoder side is stored in MD34220 \$MA_ENC_ABS_TURNS_MODULO. You can do without a traversing range extension without any problems (a hardware counter overflow that might be within the traversing range is concealed in the software via shortest-path decision):

a. in linear axes or limited rotary axes, if the actual traversing range on the load side is smaller than the traversing range on the load side that corresponds to MD34220 \$MA_ENC_ABS_TURNS_MODULO.

b. in endlessly turning rotary axes (ROT_IS_MODULO = TRUE), if the absolute encoder is connected on the load side (no gear to be considered) or if "without remainder" can be calculated:

Number of rotations on the load side = ENC_ABS_TURNS_MODULO * gear ratio

(Example: ENC_ABS_TURNS_MODULO = 4096 encoder rotations, gear 25:32, i.e. number of rotations on load side = 4096*(25/32)=3200).

Notice:

If the conditions under a. or b. are not met, there is a risk of getting a wrong absolute encoder position at next Power ON or encoder activation after parking without prewarning if the traversing range extension is not working. Therefore, the traversing range extension remains active in the standard version.

If MD31700 \$MA_ENC_EDS_ACTIVE = 1, a traversing range extension is not possible. Alarm 26017 therefore requests the traversing range extension to be switched off with a rotary absolute encoder with reference to this machine data.

If the traversing range extension is essential (because for example the conditions stated under b. for deactivation are not fulfilled), MD31700 \$MA_ENC_EDS_ACTIVE must not be activated.

30300	IS_ROT_AX			A01, A06, A11	G1, K3, R2, T1, G2, K2, R1, S1, V1	
-	Rotary axis / spindle			BOOLEAN	PowerOn	
SCAL, CTEQ						
-	-	FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE...	FALSE	TRUE	7/2	M

Description:

1: Axis: The axis is defined as a "rotary axis".

- The special functions of the rotary axis are active or can be activated by means of additional machine data according to the type of machine required (see below).
- The unit of measurement is degrees.
- The units of the axis-specific machine and setting data are interpreted as follows with the standard control setting:
 - Positions in "degrees"
 - Speeds in "rev/minute"
 - Acceleration in "rev/second²"
 - Jerk limitation in "rev/second³"

Spindle:

The machine data should always be set to "1" for a spindle, otherwise alarm 4210 "Rotary axis declaration missing" is output.

0: The axis is defined as a "linear axis".

Special cases:

- For an axis: Alarm 4200 if the axis is already defined as a geometry axis.
- For a spindle: Alarm 4210

Related to:

The following machine data are active only after activation of MD30300 \$MA_IS_ROT_AX = "1":

- MD30310 \$MA_ROT_IS_MODULO "Modulo conversion for rotary axis"
- MD30320 \$MA_DISPLAY_IS_MODULO "Position display is modulo"
- MD10210 \$MN_INT_INCR_PER_DEG "Calculation precision for angular positions"

30310	ROT_IS_MODULO			A01, A06, A11	TE3, K3, R2, T1, A3, R1, R2, S1	
-	Modulo conversion for rotary axis / spindle			BOOLEAN	PowerOn	
CTEQ						
-	-	FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE...	FALSE	TRUE	7/2	M

Description:

1: A modulo conversion is performed on the setpoints for the rotary axis. The software limit switches and the working area limitations are inactive; the traversing range is therefore unlimited in both directions. MD30300 \$MA_IS_ROT_AX must be set to "1"

0: No modulo conversion

MD irrelevant for:

MD30300 \$MA_IS_ROT_AX = "0" (linear axes)

30320	DISPLAY_IS_MODULO			A01, A06, A11	R2, T1, K2	
-	Modulo 360 degrees displayed for rotary axis or spindle.			BOOLEAN	PowerOn	
CTEQ						
-	-	FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE...	FALSE	TRUE	7/2	M

Description: 1: "Modulo 360 degrees" position display is active:
The position display of the rotary axis or spindle (for basic or machine coordinate system) is defined as "Modulo 360 degrees". In the case of a positive direction of rotation, the control resets the position display internally to 0.000 degrees following each cycle of 359.999 degrees. The display range is always positive and lies between 0 and 359.999 degrees.
0: Absolute position display is active:
In contrast to the modulo 360 degrees position display, absolute positions are indicated by the absolute position display, e.g. +360 degrees after 1 rotation, and +720 degrees after 2 rotations, etc in the positive direction. In this case, the display range is limited by the control in accordance with the linear axes.
MD irrelevant for:
Linear axes MD30300 \$MA_IS_ROT_AX = "0"
Related to:
MD30300 \$MA_IS_ROT_AX = 1 "Axis is rotary axis"

30330	MODULO_RANGE			EXP, A01	R2, T1, R1	
degrees	Size of modulo range.			DOUBLE	Reset	
CTEQ						
-	-	360.0	1.0	360000000.0	7/2	M

Description: Defines the size of the modulo range. Default positions are accepted and displayed within this range. Useful modulo ranges are $n \cdot 360$ degrees with integer n . Other settings are equally possible in principle. Attention should be paid to having a useful relationship between the positions in the NC and the mechanics (ambiguity). Velocity definitions are not affected by settings in this MD.

30340	MODULO_RANGE_START			EXP, A01	R1, R2	
degrees	Modulo range start position			DOUBLE	Reset	
CTEQ						
-	-	0.0	-MD_DBLMAX	1.0E+301	7/2	M

Description: Defines the start position for the modulo range.
Example:
Start = 0 degree -> modulo range 0 <-> 360 degrees
Start = 180 degrees -> modulo range 180 <-> 540 degrees
Start = -180 degrees -> modulo range -180 <-> 180 degrees

30350	SIMU_AX_VDI_OUTPUT			A01, A06	A2, G2, Z1	
-	Axis signals output for simulation axes			BOOLEAN	PowerOn	
CTEQ						
-	-	FALSE	FALSE	TRUE	7/2	M

2.3 NC machine data

Description:

The machine data defines whether axis-specific interface signals are output to the PLC while an axis is being simulated.

1: The axis-specific NC/PLC interface signals for a simulated axis are output to the PLC.

This means that the user PLC program can be tested without the drives having to be available.

0: The axis-specific NC/PLC interface signals for a simulated axis are not output to the PLC.

All axis-specific NC/PLC interface signals are set to "0".

Not relevant for:

-	-	0x00	0	0x7FFF	7/2	M

Description:

Bit 0 = 0:

Modulo rotary axis/spindle: programmed positions must be in the modulo range. Otherwise an alarm is output.

Bit 0 = 1:

When programming positions outside the modulo range, an alarm is not signaled. The position is modulo-converted internally.

Example: B-5 has the same significance as B355, POS[A]=730 is identical to POS[A]=10 and SPOS=-360 behaves the same as SPOS=0 (modulo range 360 degrees)

Bit 1 = 0:

Determination of reference point position of rotary, distance-coded encoders analog (1:1) in relation to the mechanical absolute position.

Bit 1 = 1:

Determination of reference point position of rotary, distance-coded encoders within the configured modulo range.

For rotary axes with MD30310 \$MA_ROT_IS_MODULO=0, which use rotary, distance-coded encoder MD34200 \$MA_ENC_REFP_MODE=3, the reference point position is determined in response to MD30330 \$MA_MODULO_RANGE and MD30340 \$MA_MODULO_RANGE_START. This is automatically adapted to the traversing limits of the modulo range. For rotary axes with MD30310 \$MA_ROT_IS_MODULO=1, this bit has no significance, as the reference point position is always determined within the modulo range.

Bit 2 = 0:

Modulo rotary axis positioned at G90 with AC as default.

Bit 2 = 1:

Modulo rotary axis positioned at G90 with DC as default (shortest path).

Bit 3 = 0:

For spindle/axis disable \$VA_IM, \$VA_IM1, \$VA_IM2 supply the setpoint value.

Bit 3 = 1:

For spindle/axis disable \$VA_IM, \$VA_IM1, \$VA_IM2 supply the actual value.

Bit 4 = 0:

Synchronous spindle coupling, slave spindle: cancellation of feedrate enable will brake the coupled group.

Bit 4 = 1:

Slave spindle: Feedrate enable only applies to the interpolation portion of the overlaid motion (SPOS, etc.) and has no impact on the coupling.

Bit 5 = 0:

Synchronous spindle coupling, slave spindle: Position control, feedforward control, and parameter block are set in response to the master spindle.

Bit 5 = 1:

Synchronous spindle coupling: The parameters of the slave spindle are set as they would be without coupling.

Bit 6 = 0:

Programming of FA, OVRA, ACC, and VELOLIM is applied separately to spindle and axis modes. The assignment is made by the programmed axis or spindle identifier.

Bit 6 = 1:

Programming of FA, OVRA, ACC, and VELOLIM is applied jointly to spindle and axis modes, irrespective of the programmed identifier.

Bit 7 = 0:

Synchronous spindle, correct synchronism error: Correction value \$AA_COUP_CORR[Sn] is continuously calculated as long as the NC/PLC interface signal DB31, ... DBX31.6 (Correct synchronism) is set and setpoint-related synchronism is present.

Bit 7 = 1:

Synchronous spindle, correct synchronism error: Correction value \$AA_COUP_CORR[Sn] is calculated only at the moment the NC/PLC interface signal DB31, ... DBX31.6 (Correct synchronism) is set from 0 to 1.

Bit 8 = 0:

Absolute encoders can only be readjusted in the enabled state MD34210
\$MA_ENC_REFP_STATE = 1.

Bit 8 = 1:

Absolute encoders can also be readjusted in the adjusted state MD34210
\$MA_ENC_REFP_STATE = 2.

Bit 9 = 0:

Coupled axes (e.g. gantry) jointly delete their pulse enable if an error occurs.

Bit 9 = 1:

Coupled axes (e.g. gantry) only delete their pulse enable for their own errors.

Bit 10 = 0:

The maximum dynamic performance of a TRAIL or TANGON axis limits the maximum dynamic path response.

Bit 10 = 1:

The maximum dynamic performance of a TRAIL or TANGON axis has no effect on the dynamic path response. This can result in a longer overtravel of the dependent axis.

Bit 11 = 0:

Deactivation of the CP software limit monitoring

Bit 11 = 1:

Activation of the CP software limit monitoring for the following slave axes/spindles:

- coupling, type CP with CPSETTYPE[FAx] = "CP"
- coupling, type CP, TRAIL, EG, LEAD, or COUP with a maximum of one active master axis/spindle

Bit 12 = 0:

2.3 NC machine data

When resetting the control enable of the stationary axis/spindle (in respect of this master axis/spindle), you must always switch over to actual value coupling, just as for a fast stop after resetting the control enable during motion (alarm 21612). This applies to generic couplings (with replacement cycles or for CP programming).

Bit 12 = 1:

When resetting the control enable of the stationary axis/spindle (in respect of this master axis/spindle), changeover to actual value coupling is inhibited. This applies to generic couplings (with replacement cycles or for CP programming).

Bit 13 = 0:

An axis-specific DRIVE setting by means of MD35240 \$MA_ACCEL_TYPE_DRIVE[] or by programming DRIVEA() of an axis is ignored by the path dynamic response if the relevant axis is interpolated with the path.

Bit 13 = 1:

An acceleration characteristic of an axis activated by MD35240 \$MA_ACCEL_TYPE_DRIVE[] or by programming of DRIVEA() is taken into account when defining the path dynamic response if the relevant axis is interpolated with the path.

Bit 14 = 0:

During cartesian PTP traversing, the "shortest path" strategy for software limit crossing of a rotary axis is retained.

Bit 14 = 1:

The "long path" strategy for avoiding the software limit crossing is used if a rotary axis were to cross the software limit switch during cartesian PTP traversing with the "shortest path" strategy.

30460	BASE_FUNCTION_MASK			A01	K5, P2, P1	
-	Axis functions			UDWORD	PowerOn	
CTEQ						
-	-	0x00	0	0x3FF	7/2	M

Description:

Axis-specific functions can be set using this MD.

The MD is bit-coded; the following bits are assigned:

Bit 0 = 0:

"Axis control" is not permissible.

Bit 0 = 1:

"Axis control" is permissible (the axis moves in the speed mode, if the NC/PLC interface signal DB31, ... DBX24.1 (Axis control) is set).

Bit 1:

Reserved for "Axis control".

Bit 2 = 0:

Axis-specific diameter programming not permitted.

Bit 2 = 1:

Axis-specific diameter programming permitted.

Bit 3:

Reserved for "Axis control".

Bit 4 = 0:

For control purposes, the axis can be used by NC and PLC.

Bit 4 = 1:

The axis is exclusively controlled by the PLC.

Bit 5 = 0:

The axis can be used by the NC and PLC.

Bit 5 = 1:

The axis is a permanently assigned PLC axis. However, the axis can be jogged and referenced.

Axis exchange between channels is not possible. The axis cannot be assigned to the NC program.

Bit 6 = 0:

The channel-specific interface signal DB21-30 DBX6.0 (feedrate disable) has an effect on the axis, even though it is a PLC-controlled axis.

Bit 6 = 1:

The channel-specific interface signal DB21-30 DBX6.0 (feedrate disable) has no effect on the axis, if it is a PLC-controlled axis.

Bit 7 = 0:

The channel-specific interface signal DB21-30 DBX36.3 (all axes stationary) is set dependent on the axis, even though it is PLC-controlled.

Bit 7 = 1:

The channel-specific interface signal DB21-30 DBX36.3 (all axes stationary) is set independent of the axis, if this axis is PLC-controlled..

Bit 8 = 0:

The axis is an 'interpolating (full) axis' (path/GEO/additional path axis/GEOAX()) spindle for thread cutting/tapping)

Bit 8 = 1:

The axis is a positioning axis / auxiliary spindle

Bit 9 = 0:

The PRESETON is enabled. PRESETONS is inhibited.

Bit 9 = 1:

The PRESETON is inhibited. PRESETONS is enabled.

30465	AXIS_LANG_SUB_MASK			N01	K1	
-	Substitution of NC language commands			UDWORD	PowerOn	
-						
-	-	0x0	0x0	0xF	7/2	M

Description:

MD30465 \$MA_AXIS_LANG_SUB_MASK defines for the leading spindle(s) of a coupling (synchronous spindle coupling, electronic gear, coupled motion, master value coupling, master-slave) which language constructs/functions are to be substituted by the user program set by MD15700 \$MN_LANG_SUB_NAME / MD15702 \$MN_LANG_SUB_PATH (default: /_N_CMA_DIR/_N_LANG_SUB_SPF).

The substitution is executed only if a coupling is active for the relevant spindle and, in the case of a gear stage change, only if a gear stage change is actually pending.

Bit 0 and bit 1 are relevant for the axis coupling types: synchronous spindle coupling, electronic gear, coupled motion and master value coupling.

Bit 2 and bit 3 are relevant for the master-slave coupling

Bit 0 = 1:

Axis coupling: Automatic (M40) and direct (M41-M45) gear stage change

Bit 1 = 1:

Axis coupling: Spindle positioning with SPOS/SPOSA/M19

Bit 2 = 1:

Master-slave coupling: Automatic (M40) and direct (M41-M45) gear stage change

Bit 3 = 1:

Master-slave coupling: Spindle positioning with SPOS/SPOSA/M19

30500	INDEX_AX_ASSIGN_POS_TAB			A01, A10	T1, H1	
-	Axis is an indexing axis			BYTE	Reset	
-						
-	-	0	0	3	7/2	M

2.3 NC machine data

Description: The axis is declared as an indexing axis by assignment of indexing position table 1 or 2.

0: The axis is not declared as an indexing axis

1: The axis is an indexing axis. The associated indexing positions are stored in table 1 (MD10910 \$MN_INDEX_AX_POS_TAB_1).

2: The axis is an indexing axis. The associated indexing positions are stored in table 2 (MD10930 \$MN_INDEX_AX_POS_TAB_2).

3: Equidistant indexing with SW 4.3 and higher (840D) and SW 2.3 and higher (810D)

>3: Alarm 17090 "Value violates upper limit"

Special cases:

Several axes can be assigned to an indexing position table on the condition that all these indexing axes are of the same type (linear axis, rotary axis, modulo 360° function). If they are not, alarm 4000 is output during power-up.

Alarm 17500 "Axis is not an indexing axis"

Alarm 17090 "Value violates upper limit"

Related to:

MD10910 \$MN_INDEX_AX_POS_TAB_1 (indexing position table 1)

MD10900 \$MN_INDEX_AX_LENGTH_POS_TAB_1
(no. of indexing positions used in table 1)

MD10930 \$MN_INDEX_AX_POS_TAB_2 (indexing position table 2)

MD10920 \$MN_INDEX_AX_LENGTH_POS_TAB_2
(no. of indexing positions used in table 2)

For equidistant indexings with value 3:

MD30501 \$MA_INDEX_AX_NUMERATOR Numerator

MD30502 \$MA_INDEX_AX_DENOMINATOR Denominator

MD30503 \$MA_INDEX_AX_OFFSET First indexing position

MD30505 \$MA_HIRTH_IS_ACTIVE Hirth tooth system

30501	INDEX_AX_NUMERATOR	A01, A10	T1
mm, degrees	Indexing axis equidistant positions numerator	DOUBLE	Reset
-			
-	-	0.0	0.0
-	-	1.0E+301	7/2
-	-		M

Description: Defines the value of the numerator for calculating the distances between two indexing positions when the positions are equidistant. Modulo axes ignore this value and use MD30330 \$MA_MODULO_RANGE instead.

MD irrelevant for non-equidistant indexes in accordance with tables.

Related to:

MD30502 \$MA_INDEX_AX_DENOMINATOR,

MD30503 \$MA_INDEX_AX_OFFSET;

MD30500 \$MA_INDEX_AX_ASSIGN_POS_TAB

30502	INDEX_AX_DENOMINATOR	A01, A10	T1
-	Indexing axis equidistant positions denominator	DWORD	Reset
-			
-	-	1	1
-	-	-	7/2
-	-		M

Description: Defines the value of the denominator for calculating the distances between two indexing positions when the positions are equidistant. For modulo axes it therefore specifies the number of indexing positions.

MD irrelevant for non-equidistant indexes in accordance with tables.

Related to:

MD30501 \$MA_INDEX_AX_NUMERATOR,

MD30503 \$MA_INDEX_AX_OFFSET,
MD30500 \$MA_INDEX_AX_ASSIGN_POS_TAB

mm, degrees	Indexing axis with equidistant positions first index position	DOUBLE	Reset
-			
-	-	0.0	-MD_DBLMAX 1.0E+301 7/2 M

Description: Defines the position of the first indexing position from zero for an indexing axis with equidistant positions.

MD irrelevant for non-equidistant indexes in accordance with tables.

Related to:

MD30501 \$MA_INDEX_AX_NUMERATOR

MD30502 \$MA_INDEX_AX_DENOMINATOR

MD30500 \$MA_INDEX_AX_ASSIGN_POS_TAB

30505	HIRTH_IS_ACTIVE	A01, A10	T1
-	Axis is an indexing axis with Hirth tooth system	BOOLEAN	Reset
CTEQ			
-	-	FALSE	FALSE TRUE 7/2 M

Description: Hirth tooth system is active when value 1 is set.

MD irrelevant if axis is not an indexing axis.

Related to:

MD30500 \$MA_INDEX_AX_ASSIGN_POS_TAB, MD30501 \$MA_INDEX_AX_NUMERATOR, MD30502 \$MA_INDEX_AX_DENOMINATOR, MD30503 \$MA_INDEX_AX_OFFSET

30550	AXCONF_ASSIGN_MASTER_CHAN	A01, A06, A10	K5, TE3, B3, S3, K1, R1
-	Initial setting of channel for change of axis	BYTE	PowerOn
-			
-	-	0, 0, 0, 0, 0, 0, 0, 0...	0 10 7/2 M

Description: Definition of the channel to which the axis is assigned after Power ON.

Related to:

MD20070 \$MC_AXCONF_MACHAX_USED

30552	AUTO_GET_TYPE	EXP, A06, A10	K5, M3, TE6, P2, P5, 2.4
-	Automatic GET for get axis	BYTE	PowerOn
-			
-	-	1, 1, 1, 1, 1, 1, 1, 1...	0 2 7/2 M

Description: 0 = No automatically created GET -> Alarm in response to incorrect programming.

1 = GET is output when GET is generated automatically.

2 = GETD is output when GET is generated automatically.

30554	AXCONF_ASSIGN_MASTER_NCU	A01, A06, A10	B3
-	Initial setting which NCU creates setpoints for the axis	BYTE	PowerOn
-			
-	-	0	0 16 7/2 M

Description: This machine data is evaluated only if the NCU is linked with other NCUs via the NCU link communication.

Assignment of master NCU:

2.3 NC machine data

If a machine axis is activated via MD10002 \$MN_AXCONF_LOGIC_MACHAX_TAB in several NCUs in an NCU cluster, then a MASTER NCU must be assigned to it. This NCU takes over the setpoint creation for the axis after the runup. For axes which are only activated in one NCU, the number of this NCU or 0 must be entered. Other entries initiate a runup interrupt.

30560	IS_LOCAL_LINK_AXIS			EXP, A01	B3	
-	Axis is a local link axis			BOOLEAN	PowerOn	
-						
-	-	FALSE	0	-	7/2	M

Description: An axis for which this MD is set to 1 is not addressed by the local NCU at runup. The associated drive is put into operation.

The axis is traversed by another NCU. The evaluation is made only if link communication exists.

Not relevant for:

Systems without link modules

Related to:

MD18780 \$MN_MM_NCU_LINK_MASK

mm, degrees	Fixed-value positions of axis with G75			DOUBLE	PowerOn	
-						
-	4	0.0, 0.0, 0.0, 0.0	-MD_DBLMAX	1.0E+301	7/2	I

Description: The fixed-point positions (4 max.) for each axis which can be approached when G75 is programmed or via JOG are entered in these machine data.

References:

/PA/, "Programming Guide: Fundamentals"

30610	NUM_FIX_POINT_POS			A03, A10	K1	
-	Number of fixed-value positions of an axis			DWORD	PowerOn	
-						
-	-	0	0	4	7/2	M

Description: Number of fixed point positions set, i.e. the number of valid entries in MD30600 \$MA_FIX_POINT_POS.

For G75, two (2) fixed point positions are assumed in MD30600 \$MA_FIX_POINT_POS for reasons of compatibility, even if '0' has been entered in this machine data.

30800	WORKAREA_CHECK_TYPE			-	A3	
-	Type of check of working area limitations.			BOOLEAN	NEW CONF	
CTEQ						
-	-	FALSE	0	-	7/2	M

Description: With this machine data you can specify whether only the working area limitations of traversing axes are to be checked (0)

or

whether the stationary axes in a traversing block are also to be checked (1).

The value 0 corresponds to the behavior up to SW5.

31000	ENC_IS_LINEAR			A02, A11	G2	
-	Linear scale			BOOLEAN	PowerOn	
-						
-	2	FALSE, FALSE	0	-	7/2	M

Description: MD = 1: Encoder for actual position value acquisition is linear (linear scale).
 MD = 0: Encoder for actual position value acquisition is rotary.
 The index [n] of the machine data has the following coding:
 [encoder no.]: 0 or 1

31010	ENC_GRID_POINT_DIST			A02, A11	G2	
mm	Division period for linear scales			DOUBLE	PowerOn	
-						
-	2	0.01, 0.01	0.0	1.0E+301	7/2	M

Description: For linear measuring system only:
 The distance between the reference marks on the linear scale must be entered in this MD.
 Index [n] of the machine data has the following coding:
 [encoder no.]: 0 or 1

31020	ENC_RESOL			A02, A11	G2, R1	
-	Encoder lines per revolution			DWORD	PowerOn	
-						
-	2	2048, 2048, 2048, 2048, 2048, 2048, 2048, 2048, 2048, 2048, 2048...	1	-	7/2	M

Description: For rotary measuring system only:
 The number of encoder lines per encoder revolution must be entered in this MD.
 Index [n] of the machine data has the following coding:
 [Encoder no.]: 0 or 1
 If MD31700 \$MA_ENC_EDS_ACTIVE = 1, this machine data has no function, and is replaced by MD31710 \$MA_ENC_RESOL_EDS.
 Related to:
 MD31700 \$MA_ENC_EDS_ACTIVE
 MD31710 \$MA_ENC_RESOL_EDS

31025	ENC_PULSE_MULT			EXP, A01, A02	-	
-	Encoder multiplication (high-resolution)			DWORD	PowerOn	
-						
-	2	2048, 2048, 2048, 2048, 2048, 2048, 2048, 2048, 2048, 2048, 2048...	0	-	7/2	M

Description: For PROFIdrive only:
 This MD describes the measuring system multiplication on PROFIBUS/PROFINET.
 Default value 2048 means: changing by just one encoder line can be seen in bit11 of the actual PROFIdrive value XIST1, that is, the actual encoder value is multiplied by 2 to the power of 11= 2048.
 If MD31700 \$MA_ENC_EDS_ACTIVE = 1, this machine data has no function, and is replaced by MD31720 \$MA_ENC_PULSE_MULT_EDS.
 Related to:
 MD31700 \$MA_ENC_EDS_ACTIVE
 MD31720 \$MA_ENC_PULSE_MULT_EDS

2.3 NC machine data

31030	LEADSCREW_PITCH			A02, A11	G2, A3	
mm	Pitch of leadscrew			DOUBLE	PowerOn	
-						
-	-	10.0	0.0	1.0E+301	7/2	M

Description: The ball screw lead must be entered in the MD (see data sheet: mm/rev or inch/rev).
Special meaning for hydraulic linear drives:
If a hydraulic linear drive (HLA) is configured as rotary axis, it must be specified in this MD, which drive feedrate in mm corresponds to a programmed revolution (360 degrees).

31040	ENC_IS_DIRECT			A02, A11	G2, S1	
-	Direct measuring system (no compilation to load position)			BOOLEAN	PowerOn	
-						
-	2	FALSE, FALSE	0	-	7/2	M

Description: MD = 1:
Encoder for actual position value acquisition is attached directly to the machine (without an intermediate gear unit).
MD = 0:
Encoder for actual position value acquisition is attached to the motor (MD31060 \$MA_DRIVE_AX_RATIO_NUMERA and MD31050 \$MA_DRIVE_AX_RATIO_DENOM are included in the encoder valuation).
The index[n] of the machine data has the following coding:
[encoder no.]: 0 or 1
Special cases:
An incorrect entry may result in an incorrect encoder resolution, as, for example, the gear ratios would be calculated incorrectly.

31044	ENC_IS_DIRECT2			A02	G2, S1	
-	Encoder mounted on the additional gearbox			BOOLEAN	NEW CONF	
-						
-	2	FALSE, FALSE	0	-	7/2	M

Description: When using a load intermediate gearbox (for example for rotating tools, compare MD31066 \$MA_DRIVE_AX_RATIO2_NUMERA and MD31064 \$MA_DRIVE_AX_RATIO2_DENOM), the encoder installation location can be defined as "on the output" of this load intermediate gearbox:
Encoder installation "on the output of the load intermediate gearbox" is configured by MD31040 \$MA_ENC_IS_DIRECT=1 and MD31044 \$MA_ENC_IS_DIRECT2=1 at the same time.
Encoder installation "on the input of the load intermediate gearbox" is configured by MD31040 \$MA_ENC_IS_DIRECT=1 together with MD31044 \$MA_ENC_IS_DIRECT2=0.
A parameterization alarm will be output if MD31044 \$MA_ENC_IS_DIRECT2=1 is set without MD31040 \$MA_ENC_IS_DIRECT=1 (this combination has not been defined).

31046	ENC_PASSIVE_PARKING			A02	-	
-	Park passive measuring system			BOOLEAN	NEW CONF	
-						
-	2	FALSE, FALSE	-	-	7/2	M

Description: The machine data can be used to configure the behavior for the passive measuring system:
MD = 0:
The passive measuring system is continuously monitored and updated.
MD = 1:

Notes:

- A measuring system switchover to a parked measuring system takes longer than a switch to a passive measuring system.
- On account of the duration, an axis standstill is recommended for the switchover.
- It is only with incremental encoders that the position and the state "Measuring system is referenced" are applied from the previously active measuring system as a function of MD34210 \$MA_ENC_REFP_STATE. In this case, renewed referencing is not absolutely necessary.

- MD30200 \$MA_NUM_ENCS is less than 2
- MD30240 \$MA_ENC_TYPE=0
- The measuring system is used on the drive side, for example as a motor measuring system for speed control. Recommendation: Do not change the default value of the machine data for a motor measuring system.
- MD32950 \$MA_POSCTRL_DAMPING>0
- MD32960 \$MA_POSCTRL_DUAL_FEEDBACK_TIME>0

31064	DRIVE_AX_RATIO2_DENOM			A02	G2, S1	
-	Denominator additional gearbox			DWORD	NEW CONF	
-						
-	-	1	1	2147000000	7/2	M

This MD together with MD31066 \$MA_DRIVE_AX_RATIO2_NUMERA defines an intermediate gearbox that acts as a multiplier to the motor/load gearbox (described by MD31060 \$MA_DRIVE_AX_RATIO_NUMERA and MD31050 \$MA_DRIVE_AX_RATIO_DENOM).

2.3 NC machine data

The load intermediate gearbox is inactive with the default values 1:1.

Please consider MD31044 \$MA_ENC_IS_DIRECT2 for encoder installation.

When the Safety Integrated functionality (see MD36901 \$MA_SAFE_FUNCTION_ENABLE) is active, the intermediate gearbox can be used, if

- the effectively active gear ratio from the motor to the tool is considered in the safety-relevant machine data and if
- the safety-relevant supplementary conditions for gear ratios are considered.

For more detailed information see the Safety Integrated Description of Functions.

CTEQ						
-	2	0.001, 0.00254	-MD_DBLMAX	1.0E+301	7/2	M

Description: The value entered in this MD defines the path of an increment which applies when an axis is traversed with the JOG keys in incremental mode or with the handwheel.
The path traveled by the axis on each increment each time the traversing key is pressed or for each handwheel detent position is defined by the following parameters:

- MD31090 \$MA_JOG_INCR_WEIGHT
(Weighting of an increment of a machine axis for INC/handwheel)
- Selected increment size (INC1, ..., INCvar)

The possible increment stages are defined globally for all axes in MD11330 \$MN_JOG_INCR_SIZE_TAB [n] and in SD41010 \$SN_JOG_VAR_INCR_SIZE.
Entering a negative value reverses the direction of evaluation of the traverse keys and the handwheel rotation.
Related to:
MD11330 \$MN_JOG_INCR_SIZE_TAB

SD41010 \$SN_JOG_VAR_INCR_SIZE

31092	JOG_INCR_WEIGHT_TRAFO	A01, A12	H1, G2
mm, degrees	Evaluation of an increment for INC/handwheel for active transformation	DOUBLE	Reset
CTEQ			
-	2	0.0, 0.0	- - 7/2 M

Description:

The input value is used to define the distance of an increment which, when traversing an axis during active transformation using the JOG keys, is valid for the incremental dimension or via handwheel.

The distance, through which the axis traverses when executing the incremental dimension with transformation active, depending on the traversing key actuated or handwheel grid position, is defined by the following parameters:

- MD31092 \$MA_JOG_INCR_WEIGHT_TRAFO
(Evaluating an increment of a machine axis for INC/handwheel)
- selected increment size (INC1, ..., INCvar)

The possible increment steps are globally defined for all axes in MD11330 \$MN_JOG_INCR_SIZE_TAB [n] or in SD41010 \$SN_JOG_VAR_INCR_SIZE.

Entering a negative value reverses the direction evaluation of the traversing keys and/or the handwheel direction of rotation.

The set value is only effective, if this is > 0 ist. For values of zero, then MD31090 \$MA_JOG_INCR_WEIGHT is effective

Corresponds with:

MD11330 \$MN_JOG_INCR_SIZE_TAB

MD31090 \$MA_JOG_INCR_WEIGHT

s	BERO delay time Plus	DOUBLE	NEW CONF
-			
-	2	0.000110, 0.000110	0.0 1.0E+301 7/2 M

Description:

This machine data in combination with the setting in MD34200 \$MA_ENC_REFP_MODE (referencing mode) = 7 causes a signal runtime compensation in the positive direction of movement at a position determined by a BERO (zero mark).

The typical total delay time of the BERO message path for overtravel in the positive direction of movement is entered.

This time includes:

- the BERO edge delay time
- the time for digitizing the signal
- the time for processing the measured value, etc.

The periods of time depend on the hardware used. The default value is typical for SIEMENS products. Adjustment by the customer is only required in exceptional cases.

Input of the minimum value "0.0" deactivates the compensation (only active in combination with MD34200 \$MA_ENC_REFP_MODE = 7).

The machine data is available for all encoders.

Description:

This machine data is used to define the effectiveness of the frames and tool length compensations for indexing axes, PLC axes and command axes started from synchronized actions.

Bit assignment:

Bit 0 = 0:

Programmable work offset (TRANS) allowed for indexing axis

Bit 0 = 1:

Programmable work offset (TRANS) forbidden for indexing axis

Bit 1 = 0:

Scale modification (SCALE) allowed for indexing axis

Bit 1 = 1:

Scale modification (SCALE) forbidden for indexing axis

Bit 2 = 0:

Direction change (MIRROR) allowed for indexing axis

Bit 2 = 1:

Direction change (MIRROR) forbidden for indexing axis

Bit 3 = 0:

DRF offset allowed for axis

Bit 3 = 1:

DRF offset forbidden for axis

Bit 4 = 0:

External work offset allowed for axis

Bit 4 = 1:

External work offset forbidden for axis

Bit 5 = 0:

Online tool compensation allowed for axis

Bit 5 = 1:

Online tool compensation forbidden for axis

Bit 6 = 0:

Synchronized action offset allowed for axis

Bit 6 = 1:

Synchronized action offset forbidden for axis

Bit 7 = 0:

Compile cycles offset allowed for axis

Bit 7 = 1:

Compile cycles offset forbidden for axis

Bit 8 = 0:

Axial frames and tool length compensation are NOT considered for PLC axes (bit evaluation for compatibility reasons)

Bit 8 = 1:

2.3 NC machine data

Axial frames are considered for PLC axes and tool length compensation is considered for PLC axes which are geometry axes.

Bit 9 = 0:

Axial frames are considered for command axes, and tool length compensation is considered for command axes which are geometry axes.

Bit 9 = 1:

Axial frames and tool length compensation are NOT considered for command axes

If the tool is treated in an active transformation, the tool length compensation is taken into account for geometry axes (as for bit9=0, see also MD24130

\$MC_TRAFO_INCLUDES_TOOL_1).

Bit 10 = 0:

In JOG mode, too, traversing of a geometry axis as a PLC or command axis is NOT allowed with active rotation.

Bit 10 = 1:

In JOG mode, traversing of a geometry axis as a PLC axis or command axis (static synchronized action) is allowed with active rotation (ROT frame). Traversing must be terminated prior to returning to AUTOMATIC mode (neutral axis state), as otherwise alarm 16908 would be output when the mode is changed.

Bit 11 = 0:

In 'Program interrupted' status, repositioning to the interrupt position (AUTO - JOG) takes place when changing from JOG to AUTO.

Bit 11 = 1:

Prerequisite: Bit 10 == 1 (PLC or command axis motion with active rotation in JOG mode).

In 'Program interrupted' status, the end point of the PLC or command axis motion is taken over when changing from JOG to AUTOMATIC and the geometry axes are positioned according to the rotation

>0: Limitation of size of selected increment \$MN_JOG_INCR_SIZE<Increment/VDI signal> 0 or SD41010 \$SN_JOG_VAR_INCR_SIZE for the associated machine axis

0: No limitation

32084	HANDWH_STOP_COND				EXP, A10	H1	
-	Handwheel travel behavior				UDWORD	Reset	
CTEQ							
-	-	0x10FF	0	0x1FFF	7/2	M	

Description:

Definition of the response of the handwheel travel to axis-specific VDI interface signals or the CP-SW limit stop or a stop from an OEM application:

Bit = 0:

Interruption or collection of the distances preset via the handwheel.

Bit = 1:

Cancellation of the traversing motion or no collection.

Bit assignment:

Bit 0: feedrate override

Bit 1: spindle speed override

Bit 2: feedrate stop/spindle stop or CP-SW limit stop or stop from an OEM application

Bit 3: clamping procedure running (= 0 no effect)

Bit 4: servo enable

Bit 5: pulse enable

For machine axis:

Bit 6 = 0

For handwheel travel, the maximum velocity at which the relevant machine axis can be traversed is the feedrate set in MD32020 \$MA_JOG_VELO.

Bit 6 = 1

For handwheel travel, the maximum velocity at which the relevant machine axis can be traversed is the feedrate set in MD32000 \$MA_MAX_AX_VELO.

Bit 7 = 0

The override is active in handwheel travel.

Bit 7 = 1

The override is always assumed to be 100% for handwheel travel, regardless of how the override switch is set.

Exception: override 0% is always active.

Bit 8 = 0

The override is active with DRF

Bit 8 = 1

The override is always assumed to be 100% for DRF, regardless of how the override switch is set.

Exception: override 0% is always active.

2.3 NC machine data

Bit 9 = 0

For handwheel travel, the maximum possible velocity with revolutional feedrate is

- with the feedrate in SD41120 \$SN_JOG_REV_SET_VELO or
 - the feedrate in MD32050 \$MA_JOG_REV_VELO or
 - in the case of rapid traverse with MD32040 \$MA_JOG_REV_VELO_RAPID
- of the relevant machine axis calculated with the spindle or rotary axis feedrate.

Bit 9 = 1

For handwheel travel, the maximum possible velocity is with the revolutional feedrate in MD32000 \$MA_MAX_AX_VELO of the relevant machine axis. (see also bit 6)

Bit 10 = 0

For overlaid motions, \$AA_OVR is not active.

Bit 10 = 1

For overlaid motions (DRF, \$AA_OFF, external work offset, online tool offset), the override \$AA_OVR settable via synchronized actions is active.

Bit 11 = 0

With the VDI interface signal DB31, ... DBX93.5 (Drive Ready) missing, paths defined by the handwheel are not collected, but a traversing request is displayed. Start of a continuous JOG motion in continuous mode (MD41050 \$SN_JOG_CONT_MODE_LEVELTRIGGRD 41050 = 0) or an incremental JOG motion in continuous mode (MS11300 \$MN_JOG_INC_MODE_LEVELTRIGGRD 11300 = 0) is displayed as a traversing request. With "driveReady" = 1, however, the tool is not traversed, but the procedure is canceled and must be started again.

Bit 11 = 1

With the VDI interface DB31, ... DBX93.5 (Drive Ready) missing, the paths defined by the handwheel are collected. Start of a continuous JOG motion in continuous mode (MD41050 \$SN_JOG_CONT_MODE_LEVELTRIGGRD 41050 = 0) or an incremental JOG motion in continuous mode (MS11300 \$MN_JOG_INC_MODE_LEVELTRIGGRD 11300 = 0) is displayed and saved as a traversing request. With "driveReady" = 1 the traversing motion is started.

Bit 12 = 0

Interruption or collection of the distances preset via the handwheel with safe operational stop.

Bit 12 = 1

Cancellation of the traversing motion or no collection with safe operational stop.

32090	HANDWH_VELO_OVERLAY_FACTOR			A10, A04	H1	
-	Ratio of JOG velocity to handwheel velocity (DRF)			DOUBLE	Reset	
CTEQ						
-	-	0.5	0.0	1.0E+301	7/2	M

Description:

The velocity active with the handwheel in DRF can be reduced from the JOG velocity with this machine data.

The following applies to linear axes for the velocity active with DRF:

$v_{DRF} = SD41110 \$SN_JOG_SET_VELO * MD32090 \$MA_HANDWH_VELO_OVERLAY_FACTOR$

or when $SD41110 \$SN_JOG_SET_VELO = 0$:

$v_{DRF} = MD32020 \$MA_JOG_VELO * MD32090 \$MA_HANDWH_VELO_OVERLAY_FACTOR$

The velocity setting in SD41130 \$SN_JOG_ROT_AX_SET_VELO applies for DRF on rotary axes instead of the value in SD41110 \$SN_JOG_SET_VELO.

MD irrelevant for:

JOG handwheel

MD32020 \$MA_JOG_VELO (JOG axis velocity)

SD41110 \$SN_JOG_SET_VELO (JOG velocity for G94)

SD41130 \$SN_JOG_ROT_AX_SET_VELO (JOG velocity for rotary axes)

32100	AX_MOTION_DIR			A07, A03, A11	G1, TE3, G2	
-	Traversing direction (not control direction)			DWORD	PowerOn	
-						
-	-	1, 1, 1, 1, 1, 1, 1, 1...	-1, -1, -1, -1, -1, -1, -1, -1...	1, 1, 1, 1, 1, 1, 1, 1, 1...	7/2	M

Description: The direction of movement of the machine can be reversed with this MD.
The control direction is, however, not destroyed; i.e. closed-loop control remains stable.
-1: Direction reversal
0, 1: No direction reversal

32110	ENC_FEEDBACK_POL			A07, A02, A11	G2	
-	Sign actual value (control direction)			DWORD	PowerOn	
-						
-	2	1, 1	-1	1	7/2	M

Description: The evaluation direction of the shaft encoder signals is entered in the MD.
-1: Actual value reversal
0, 1: No actual value reversal
The index[n] of the machine data is encoded as follows:
[Encoder no.]: 0 or 1
Special cases:
The axis can run off if an incorrect control direction is entered.
Depending on the setting of the corresponding limit values, one of the following alarms is displayed:
Alarm 25040 "Standstill monitoring"
Alarm 25050 "Contour monitoring"
Alarm 25060 "Speed setpoint limitation"
If an uncontrolled setpoint step change occurs on connection of a drive, the control direction might be incorrect.
Note:
In the case of SINAMICS drives, we recommend that the direction of motion is reversed in the drive (see P410).
This is obligatory if you are using DSC (see also MD32640 \$MA_STIFFNESS_CONTROL_ENABLE).

32200	POSCTRL_GAIN			A07, A11	G1, TE1, TE9, K3, S3, A2, A3, D1, G2, S1, V1	
1000/min	Servo gain factor			DOUBLE	NEW CONF	
CTEQ, -						
-	6	16.66666667, 16.66666667, 16.66666667, 16.66666667, 16.66666667,	0	2000.	7/2	M

Description: Position controller gain, or servo gain factor.
The input/output unit for the user is [(m/min)/mm].
I.e. MD32200 \$MA_POSCTRL_GAIN[n] = 1 corresponds to a 1 mm following error at V = 1m/min.
The following machine data have default settings for adapting the standard selected input/output unit to the internal unit [rev/s].

2.3 NC machine data

- MD10230 \$MN_SCALING_FACTORS_USER_DEF[9] = 16.666667S
- MD10220 \$MN_SCALING_USER_DEF_MASK = 0x200; (bit no 9 as hex value).

If the value "0" is entered the position controller is opened.

When entering the servo gain factor it is important to take into account that the gain factor of the whole position control loop is still dependent on other parameters of the controlled system. A distinction should be made between a "desired servo gain factor" (MD32200 \$MA_POSCTRL_GAIN) and an "actual servo gain factor" (produced by the machine). Only when all the parameters of the control loop are matched will these servo gain factors be the same.

Other factors are:

- Speed setpoint adjustment (MD32260 \$MA_RATED_VELO, MD32250 \$MA_RATED_OUTVAL) or automatic speed setpoint interface adjustment (with MD32250 \$MA_RATED_OUTVAL = 0 etc.)
- Correct actual value recording of the position encoder (no. of encoder pulses, high resolution, encoder mounting location, gear etc.)
- Correct actual speed recording on the drive (standardization, possibly tacho compensation, tacho generator)

Note:

Axes which interpolate together and are to perform a machining operation, must either have the same gain setting (i.e. have the identical following error = 45° slope at the same velocity) or they must be matched via MD32910 \$MA_DYN_MATCH_TIME.

The actual servo gain factor can be checked by means of the following error (in the service display).

In the case of analog axes, a drift compensation must be performed prior to the control.

The index [n] of the machine data has the following coding:

[control parameter set no.]: 0-5

32210	POSCTRL_INTEGR_TIME			A07	G2	
s	Position controller integral time			DOUBLE	NEW CONF	
-						
-	-	1.0	0	10000.0	7/2	M

Description: Position controller integral action time for the integral component in s
The MD is only active if MD32220 \$MA_POSCTRL_INTEGR_ENABLE = TRUE.
A value of the MD less than 0.001 disables the integral component of the PI controller. The controller is then a P controller, which works with disabled manipulated variable clamping (see also MD32230 \$MA_POSCTRL_CONFIG, bit0 = 1).

32220	POSCTRL_INTEGR_ENABLE			A07	G2	
-	Enable integral component position controller			BOOLEAN	PowerOn	
-						
-	-	FALSE	0	-	7/2	M

Description: Enable of the integral component position controller; the position controller is then a PI controller in which the manipulated variable clamping is disabled (s.a. MD32230 \$MA_POSCTRL_CONFIG, bit0 = 1).
Position overshoots may occur if the integral component is used. For this reason, this functionality may only be used in special cases.

32230	POSCTRL_CONFIG			A07	TE1	
-	Configuration of the position controller structure			UBYTE	PowerOn	
-						
-	-	0	0	0x1f	7/2	M

Description: Configuration of the position controller structure:

Bit0 = 1: Manipulated variable clamping inactive

Bit4 = 1: Accelerated exact stop signal active

32250	RATED_OUTVAL			A01, A11	A3, D1, G2	
%	Rated output voltage			DOUBLE	NEW CONF	
CTEQ						
-	1	0.0	0.0	200	7/2	M

Description:

a.)

Scaling of the manipulated variable with analog drives:

The value of the speed setpoint in percent is to be entered in this MD, in relation to the maximum speed setpoint at which the motor speed specified in MD32260 \$MA_RATED_VELO[n] is reached.

Related to:

MD32250 \$MA_RATED_OUTVAL[n] only makes sense in combination with MD32260 \$MA_RATED_VELO[n].

Example:

1. At a voltage of 5V, the drive reaches a speed of 1875 rpm ==> RATED_OUTVAL = 50%, RATED_VELO = 11250 [degrees/s]
2. At a voltage of 8V, the drive reaches a speed of 3000 rpm ==> RATED_OUTVAL = 80%, RATED_VELO = 18000 [degrees/s]
3. At a voltage of 1.5V, the drive reaches a speed of 562.5 rpm ==> RATED_OUTVAL = 15%, RATED_VELO = 3375 [degrees/s]

All three examples are possible for one and the same drive/converter. The ratio of the two values is decisive; it is the same in all three examples.

MD32250 \$MA_RATED_OUTVAL and MD32260 \$MA_RATED_VELO describe physical properties of converter and drive; they can therefore only be determined by means of a measurement or commissioning instructions (converter, drive).

b.)

Scaling of the manipulated variable with digital PROFIdrive drives:

Default value "0" declares MD32250 \$MA_RATED_OUTVAL and MD32260 \$MA_RATED_VELO as invalid. Scaling of the manipulated variable is automatically determined and adjusted from the drive parameters instead.

Otherwise (MD32250 \$MA_RATED_OUTVAL unequal to zero), the scaling of the manipulated variable is not determined from the drive (for example non-Siemens PROFIdrive drives), but set with RATED_VELO and RATED_OUTVAL, even in the case of these, irrespective of the scaling active on the drive side. In this case, the following applies:

Scaling of the manipulated variable on the drive = $\text{RATED_VELO} / \text{RATED_OUTVAL}$

Further scalings from drive parameters, such as torque scaling, are not active if MD32250 \$MA_RATED_OUTVAL is not equal to zero, the values based on it remain zero.

In the case of simultaneous operation of analog and PROFIdrive drives, the settings for the analog axes must be adjusted as described in a.).

32260	RATED_VELO			A01, A11	A3, D1, G2	
rev/min	Rated motor speed			DOUBLE	NEW CONF	
CTEQ						
-	1	3000.0, 3000.0, 3000.0, 3000.0, 3000.0, 3000.0, 3000.0, 3000.0...	0.0	1.0E+301	7/2	M

Description:

Only applies when:

MD32250 \$MA_RATED_OUTVAL is set greater than 0.

2.3 NC machine data

The drive speed (scaled on the drive) that is reached with the percentual speed setpoint specified in MD32250 \$MA_RATED_OUTVAL[n] must be entered in the MD.

Related to:

MD32260 \$MA_RATED_VELO[n] only makes sense in combination with MD32250 \$MA_RATED_OUTVAL[n].

32300	MAX_AX_ACCEL			A11, A04	M3, TE6, Z3, H1, K3, M1, A3, B1, B2, K1, V1, 2.4	
m/s², rev/s²	Maximum axis acceleration			DOUBLE	NEW CONF	
CTEQ						
-	6	1.0, 1.0, 1.0, 1.0, 1.0, 1.0, 1.0, 1.0, 1.0, 1.0, 1.0, 1.0, 1.0,...	1.0e-6, 1.0e-6, 1.0e-6, 1.0e-6, 1.0e-6, 1.0e-6, 1.0e-6, 1.0e-6, ...	MD_DBLMAX, MD_DBLMAX, MD_DBLMAX, MD_DBLMAX, MD_DBLMAX, MD_DBLMAX...	7/2	M

Description:

Maximum acceleration, i.e. change in setpoint velocity, which is to act upon the axis. The value limits both positive and negative axis acceleration.

The maximum angular or linear axis acceleration must be entered dependent upon machine data MD30300 \$MA_IS_ROT_AX.

In the case of linear interpolation of the axes in a grouping, the grouping is limited in such a way that no axis is overloaded. With regard to contour accuracy, the control dynamic behavior has to be taken into account.

Not relevant for error states that lead to quick stop.

Each field element corresponds to a G code in the 59th G code group.

Related to:

MD32310 \$MA_MAX_ACCEL_OVL_FACTOR

MD32434 \$MA_G00_ACCEL_FACTOR

MD32433 \$MA_SOFT_ACCEL_FACTOR

-	Overload factor for axial velocity steps			DOUBLE	NEW CONF	
CTEQ						
-	6	1.2, 1.2, 1.2, 1.2, 1.2, 1.2	0.0	1.0E+301	7/7	U

Description:

The overload factor limits the velocity jump of the machine axis on block transition. The value entered is related to the value of MD32300 \$MA_MAX_AX_ACCEL (axis acceleration) and states by how much the maximum acceleration can be exceeded for one IPO cycle.

Related to:

MD32300 \$MA_MAX_AX_ACCEL (axis acceleration)

MD10070 \$MN_IPO_SYSCLOCK_TIME_RATIO (interpolator clock)

Each field element corresponds to a G code in the 59th G group.

32320	DYN_LIMIT_RESET_MASK			A05, A06, A10, A04	-	
-	Reset behavior of dynamic response limitation.			UDWORD	Reset	
CTEQ						
-	-	0	0	0x03	7/2	M

Description:

MD32320 \$MA_DYN_LIMIT_RESET_MASK is used to set the reset response of functions limiting dynamic response for specific axes and groups.

The MD is bit-coded, bit 0 (LSB) and bit 1 are currently allocated.

Bit 0 = 0:

Programmed ACC, VELOLIM and JERKLIM are reset to 100% with channel reset/M30 if the channel-specific MD22410 \$MC_F_VALUES_ACTIVE_AFTER_RESET is also zero.

For spindle mode, programmed ACC and VELOLIM are reset to 100% with channel reset/M30 if MD35040 \$MA_SPIND_ACTIVE_AFTER_RESET is zero and the channel-specific MD22400 \$MC_S_VALUES_ACTIVE_AFTER_RESET is also zero.

Bit 0 = 1:

Programmed ACC, VELOLIM and JERKLIM are retained beyond channel reset/M30.

Bit 1 = 0:

Programmed ACCLIMA, VELOLIMA and JERKLIMA are reset to 100% with channel reset/M30, if MD22410 \$MC_F_VALUES_ACTIVE_AFTER_RESET is also zero.

Bit 1 = 1:

Programmed ACCLIMA, VELOLIMA and JERKLIMA are retained beyond channel reset/M30.

Notes:

In MD22410 \$MC_F_VALUES_ACTIVE_AFTER_RESET, the reset responses of the dynamic instructions ACC, VELOLIM, JERKLIM, ACCLIMA, VELOLIMA and JERKLIMA are set channel specifically. If the MD is set, then the values are also retained.

For spindle mode, the values for ACC and VELOLIM are also retained if MD35040 \$MA_SPIND_ACTIVE_AFTER_RESET is not equal to zero or the channel-specific MD22400 \$MC_S_VALUES_ACTIVE_AFTER_RESET is not equal to zero.

32400	AX_JERK_ENABLE			A07, A04	B2	
-	Axial jerk limitation			BOOLEAN	NEW CONF	
CTEQ, -						
-	-	FALSE	0	-	7/2	M

Description:

Enables the function of an axial jerk limitation.

The limitation is set via a time constant; it is always active.

The limitation works independently of the limitations "path-related maximum jerk", "knee-shaped acceleration characteristic" and the axial jerk limitation of the axes that are operated in JOG mode or positioning axis mode.

Related to:

MD32410 \$MA_AX_JERK_TIME (time constant for axial jerk limitation)

32402	AX_JERK_MODE			A07, A04	B2, G2, B3	
-	Filter type for axial jerk limitation			BYTE	PowerOn	
CTEQ, -						
-	-	1	1	55	7/2	M

Description:

Filter type for axial jerk limitation:

1: 2nd order filter

2: Moving averaging

3: Bandstop filter

4: Double moving averaging

5: FIR low pass

Two-character parameterization activates switchable filter chains e.g.

25: switchable filter chain with jerk filters of type 5 and type 2

Notes on parameterization:

MD32402 \$MA_AX_JERK_MODE is only effective if MD32400 \$MA_AX_JERK_ENABLE is set to 1.

Type1 requires the setting of

MD32410 \$MA_AX_JERK_TIME

Recommended values from min: 0.03 s to max. 0.06 s

2.3 NC machine data

Type 1 is offered for compatibility reasons, type 2 is recommended

Type 2 requires the setting of

MD32410 \$MA_AX_JERK_TIME

Recommended values from min: 1 position-control cycle to max: 127 position-control cycles. At 2 ms for a position-control cycle this corresponds to from 0.002 s to 0.254 s.

Type 2 requires more computing time than type 1, but causes smaller contour errors for the same smoothing effect, or smoother movements with the same accuracy.

Type 3 requires the setting of

MD32410 \$MA_AX_JERK_TIME

MD32412 \$MA_AX_JERK_FREQ

MD32414 \$MA_AX_JERK_DAMP.

To parameterize a pure bandstop filter, it is recommended to set MD32410

\$MA_AX_JERK_TIME=0

, whereby "denominator frequency = numerator frequency = blocking frequency = MD32412 \$MA_AX_JERK_FREQ" is set automatically.

Whereas with MD32410 \$MA_AX_JERK_TIME > 0 a separate denominator frequency is set so that a bandstop filter can be implemented with an increased amplitude at frequencies above the blocking frequency.

Type 4 corresponds to two type 2 filters connected in series, and therefore requires the setting of

MD32410 \$MA_AX_JERK_TIME

MD32411 \$MA_AX_JERK_TIME_ADD

Type 5 requires the setting of

MD32407 \$MA_AX_JERK_FIR_FREQ

MD32408 \$MA_AX_JERK_FIR_ORDER

MD32409 \$MA_AX_JERK_FIR_WINDOW

Two character parameterization activates switchable filter chains, e.g.

type 25 complements type 5 with a switchable alternative type 2

The parameterization is made in index 0 of the parameters for type 5 and in index 1 of the parameters for type 2.

A runtime adaptation of the switchable filter chains is possible in the indices 0 and 1 of MD32895 \$MA_DESVAL_DELAY_TIME if this is enabled by MD32890

\$MA_DESVAL_DELAY_ENABLE.

-						
-	6	1.0, 1.0, 1.0, 1.0, 1.0, 1.0	1.0	1.0E+301	3/3	I

Description: Factor for setting adaptive jerk adjustment for an axis.
Jerk adjustment becomes active only if the value of this MD is greater than 1.
The speed-dependent axial jerk is only used for defining the maximum path velocity and does not affect the maximum path acceleration and maximum path jerk. Therefore, speed-dependent jerk adaptation only affects traversing that includes geometric torsion (change of the curvature). Both the curvature and torsion of linear movements are zero, and jerk adaptation has no effect.
There is an entry for each dynamic G code group.
See also MD32437 \$MA_AX_JERK_VEL0 and MD32438 \$MA_AX_JERK_VEL1.

32440	LOOKAH_FREQUENCY			EXP, A04	B1	
-	Smoothing frequency for LookAhead			DOUBLE	NEW CONF	
-						
-	-	10.	0.0	1.0E+301	7/2	M

Description: It is always the minimum of all the axes participating in the path which is determined.
If vibrations are aroused in the mechanics of this axis and if their frequency is known, then this MD should be set to a lower value than this frequency.

32450	BACKLASH			A09	K3, G2	
mm, degrees	Backlash			DOUBLE	NEW CONF	
-						
-	2	0.0, 0.0	-MD_DBLMAX	1.0E+301	7/2	I

Description: Backlash on reversal between positive and negative travel directions.
Input of the compensation value is

- positive, if the encoder is leading the machine part (normal situation)
- negative, if the encoder is behind the machine part.

Backlash compensation is not active when 0 is entered.

Backlash compensation is always active after reference point approach in all operating modes.

Special cases:

A specific backlash on reversal must be entered for each measuring system.

Related to:

MD30200 \$MA_NUM_ENCS (number of measuring systems)

-	2	0, 0	0	0x3	7/2	I

Description:

Bit 0 = 0:

The backlash compensation value is not restored at Power On.

Bit 0 = 1:

The backlash compensation value is restored at Power On.

Bit 1 = 0:

The backlash compensation responds to other compensation movements (temperature compensation, sag and angularity error compensation).

Bit 1 = 1:

The backlash compensation does not respond to other compensation movements (temperature compensation, sag and angularity error compensation).

32455	BACKLASH_ACT_COMP			A09	-	
-	Internal value of backlash compensation			DOUBLE	PowerOn	
NDLD, NBUP, -						
-	2	0.0, 0.0	-	-	7/2	I

Description:

The current numerical value of the backlash compensation is stored in this MD (in internal format representation) so that the compensation value can be restored at Power On.

32456	BACKLASH_DYN			A09	-	
mm, degrees	Compensation value of dynamic backlash compensation			DOUBLE	NEW CONF	
-						
-	2	0.0, 0.0	-	-	7/2	I

Description:

Compensation value for dynamic backlash compensation value

The entry of the compensation value is

2.3 NC machine data

- positive if the encoder leading the machine part (normal case)
- negative if the encoder is following the machine part.

Backlash compensation becomes ineffective if 0 is entered.

The dynamic backlash compensation can only be activated after the reference point approach. Activation takes place via PLC user interface signals.

Special cases:

A separate compensation value must be entered for each measuring system.

Corresponds to:

32500	FRICT_COMP_ENABLE			A09	K3, G2	
-	Friction compensation active			BOOLEAN	NEW CONF	
-						
-	-	FALSE	0	-	7/2	I

Description:

1: Friction compensation is enabled for this axis.

The corresponding friction compensation is active as function of the setting of MD32490 \$MA_FRICT_COMP_MODE.

In the case of neural QEC, the machine data should not be set to "1" until a valid characteristic has been "learnt".

During the learning stage, the compensation values are added on independently of the contents of this machine data.

0: Friction compensation is not enabled for this axis.

Thus, no friction compensation values are entered.

Related to:

MD32490 \$MA_FRICT_COMP_MODE

32510	FRICT_COMP_ADAPT_ENABLE				EXP, A09	K3	
-	Adaptation friction compensation active				BOOLEAN	NEW CONF	
-							
-	1	FALSE	0	-	7/2	I	

Description:

1: Friction compensation with amplitude adaptation is enabled for the axis.

Quadrant errors on circular contours can be compensated with friction compensation.

The amplitude of the friction compensation value required to be added on is frequently not constant over the entire acceleration range. That is, a lower compensation value needs to be entered for optimum friction compensation for higher accelerations than for lower accelerations.

The parameters of the adaptation curve have to be determined, and entered in the machine data.

0: Friction compensation with amplitude adaptation is not enabled for the axis.

32580	FRICT_COMP_INC_FACTOR			A09	K3	
%	Weighting of friction compensation value with short travel motions.			DOUBLE	NEW CONF	
-						
-	1	0.0	0	100.0	7/2	I

Description: The optimum friction compensation value determined by the circularity test can cause overcompensation of this axis if compensation is activated and axial positioning movements are short.

In such cases, a better setting can be achieved by reducing the amplitude of the friction compensation value and acts on all positioning blocks that are made within an interpolation cycle of the control.

The factor that has to be entered can be determined empirically and can be different from axis to axis because of the different friction conditions. The input range is between 0 and 100% of the value determined by the circularity test.

The default setting is 0; so that no compensation is performed for short traversing movements.

32610	VELO_FFW_WEIGHT			A07, A09	G1, TE1, K3, S3, A3, G2, S1, V1	
-	Feedforward control factor f. velocity/speed feedforward control			DOUBLE	NEW CONF	
-						
-	6	1.0, 1.0, 1.0, 1.0, 1.0, 1.0	0.0	1.0E+301	7/2	M

Description: Weighting factor for feedforward control. Is normally = 1.0 on digital drives, since these keep the setpoint speed exactly .

On analog drives, this factor can be used to compensate the gain error of the drive actuator, so that the actual speed becomes exactly equal to the setpoint speed (this reduces the following error with feedforward control).

On both drive types, the effect of the feedforward control can be continuously reduced with a factor of < 1.0, if the machine moves too abruptly and other measures (e.g. jerk limitation) are not to be used. This also reduces possibly existing overshoots; however, the error increases on curved contours, e.g. on a circle. With 0.0, you have a pure position controller without feedforward control.

Contour monitoring takes into account factors < 1.0.

In individual cases, it can, however, become necessary to increase MD CONTOUR_TOL.

32620	FFW_MODE			A07, A09	G1, K3, S3, G2, S1	
-	Feedforward control mode			BYTE	Reset	
-						
-	-	3	0	4	7/2	M

Description: FFW_MODE defines the feedforward control mode to be applied on an axis-specific basis:

0 = No feedforward control

1 = Speed feedforward control with PT1 balancing

2 = Torque feedforward control (only for SINAMICS) with PT1 balancing

3 = Speed feedforward control with Tt balancing

4 = Torque feedforward control (only for SINAMICS) with Tt balancing

The high-level language instructions FFWON and FFWOF are used to activate and deactivate feedforward control for specific channels on all axes.

To prevent feedforward control from being affected by these instructions on individual axes, you can define that it is always activated or always deactivated in machine data FFW_ACTIVATION_MODE (see also FFW_ACTIVATION_MODE).

If a feedforward control mode is selected (speed or torque feedforward control), MD32630 \$MA_FFW_ACTIVATION_MODE can be used to program in addition whether feedforward control can be activated or deactivated by the part program.

Note for SINAMICS drives with torque feedforward control selected:

Alarm 26016 refers to the current machine data if the telegram used (see MD13060 \$MN_DRIVE_TELEGRAM_TYPE) does not support the torque feedforward control function. Remedy: Use telegram 136.

MD32650 \$MA_AX_INERTIA

32630	FFW_ACTIVATION_MODE			A07, A09	K3, G2	
-	Activate feedforward control from program			BYTE	Reset	
CTEQ, -						
-	-	1	0	2	7/2	M

Description:

MD32630 \$FFW_ACTIVATION_MODE can be used to define whether the feedforward control for this axis/spindle can be switched on and off by the part program.

0 = The feedforward control cannot be switched on or off by the high-level language elements FFWON and FFWOF respectively.

For the axis/spindle, the state specified by MD32620 \$MA_FFW_MODE is therefore always effective.

1 = The feedforward control can be switched on and off by the part program with FFWON and FFWOF respectively.

The instruction FFWON/FFWOF becomes active immediately

2 = The feedforward control can be switched on and off by the part program with FFWON and FFWOF respectively.

The instruction FFWON/FFWOF does not become active until the next axis standstill

The default setting is specified by the channel-specific MD20150 \$MC_GCODE_RESET_VALUES. This setting is valid even before the first NC block is executed.

Notes:

The last valid state continues to be active even after Reset (and therefore also with JOG).

As the feedforward control of all axes of the channel is switched on and off by FFWON and FFWOF respectively, MD32630 \$MA_FFW_ACTIVATION_MODE should be set identically for axes interpolating with one another.

Switching feedforward control on or off while the axis/spindle is traversing may cause compensation operations in the control loop. Interpolating axes are therefore stopped by the part program if such switching operations occur (internal stop Stop G09 is triggered).

Higher servo gain factors are possible if stiffness control is active (MD32200 \$MA_POSCTRL_GAIN).

Notes:

2.3 NC machine data

The availability of this function is determined by the drive used (the drive has to support the DSC function).

Note on PROFIdrive drives:

Alarm 26017 refers to this machine data if:

a. The PROFIdrive telegram used (see MD13060 \$MN_DRIVE_TELEGRAM_TYPE) does not support the DSC function or does not contain an encoder 1 (such as Tel. 118), to which the DSC scaling for PZD XERR refers. Remedy: Use a sufficiently powerful telegram which also includes encoder 1 (e.g. Tel. 106, 116).

b. Specifically for SINAMICS drives, if inversion of the encoder signal is parameterized in MD32110 \$MA_ENC_FEEDBACK_POL=-1 with active DSC. Remedy: Remove inversion of the encoder signal from MD32110 \$MA_ENC_FEEDBACK_POL, and enter it in SINAMICS parameter P410 instead.

32650	AX_INERTIA			EXP, A07, A09	G1, K3, S3, G2	
kgm²	Inertia for torque feedforward control			DOUBLE	NEW CONF	
-						
-	-	0.0	0.0	1.0E+301	7/2	M

Description:

SINAMICS only:

Inertia of axis. Used for torque feedforward control.

With torque feedforward control, an additional current setpoint proportional to the torque is directly injected at the input of the current controller. This value is formed using the acceleration and the moment of inertia. The equivalent time constant of the current control loop must be defined for this purpose and entered in MD32800 \$MA_EQUIV_CURCTRL_TIME.

The total moment of inertia of the axis (drive + load) must also be entered in MD32650 \$MA_AX_INERTIA (total moment of inertia referred to motor shaft according to data supplied by machine manufacturer).

When MD32650 \$MA_AX_INERTIA and MD32800 \$MA_EQUIV_CURCTRL_TIME are set correctly, the following error is almost zero even during acceleration (check this by looking at the "following error" in the service display).

The torque feedforward control is deactivated if MD32650 \$MA_AX_INERTIA is set to 0. However, because the calculations are performed anyway, torque feedforward control must always be deactivated with MD32620 \$MA_FFW_MODE = 0 or 1 or 3 (recommended). Because of the direct current setpoint injection, torque feedforward control is only possible on digital drives.

-	-	10.0	0	100.0	7/2	M

Description: In sag compensation, modification of the total compensation value (sum of the compensation values of all active compensation relations) is limited axially. The maximum change value is defined in this machine data as a percentage of MD32000 \$MA_MAX_AX_VELO (maximum axis velocity).

If the change in the total compensation value is greater than the maximum value, alarm 20125 is output. Program processing is however continued. The path not covered because of the limitation is made up as soon as the compensation value is no longer subject to limitation.

MD irrelevant to:

- MSEC
- Backlash compensation
- Temperature compensation

Related to:

32750	TEMP_COMP_TYPE			A09	K3, W1	
-	Temperature compensation type			UBYTE	PowerOn	
CTEQ						
-	-	0	0	0x7	7/2	M

Description:

The type of temperature compensation applicable to the machine axis is activated in MD32750 \$MA_TEMP_COMP_TYPE.

A distinction is made between the following types:

Bit 0 = 0:

Position-independent temperature compensation not active

Bit 0 = 1:

Position-independent temperature compensation active

Bit 1 = 0:

Position-dependent temperature compensation not active

Bit 1 = 1:

Position-dependent temperature compensation active

Bit 2 = 0:

Temperature compensation not active in tool direction

Bit 2 = 1:

Temperature compensation active in tool direction

Related to:

SD43900 \$SA_TEMP_COMP_ABS_VALUE

Position-dependent temperature compensation value

SD43920 \$SA_TEMP_COMP_REF_POSITION

Reference point for position-dependent temperature compensation

SD43910 \$SA_TEMP_COMP_SLOPE

Gradient for position-dependent temperature compensation

MD32760 \$MA_COMP_ADD_VELO_FACTOR

Excessive velocity due to compensation

2.3 NC machine data

32760	COMP_ADD_VELO_FACTOR			EXP, A09, A04	K3	
-	Excessive velocity due to compensation			DOUBLE	NEW CONF	
CTEQ						
-	-	0.01	0.	0.10	7/2	M

Description:

The maximum distance that can be traversed because of temperature compensation in one IPO cycle can be limited by the axial MD32760 \$MA_COMP_ADD_VELO_FACTOR.

If the resulting temperature compensation value is above this maximum, it is traversed over several IPO cycles. There is no alarm.

The maximum compensation value per IPO cycle is specified as a factor referring to the maximum axis velocity (MD32000 \$MA_MAX_AX_VELO).

The maximum gradient of the temperature compensation tanbmax is also limited with this machine data.

Example of calculation of the maximum gradient tanb(max):

1. Calculation of the interpolator cycle time (see Description of Functions Velocities, Setpoint/Actual Value Systems, Cycle Times (G2))

Interpolator cycle time = Basic system clock rate * factor for interpolation cycle

Interpolator cycle time = MD10050 \$MN_SYSCLOCK_CYCLE_TIME ^ MD10070 \$MN_IPO_SYSCLOCK_TIME_RATIO

Example:

MD10050 \$MN_SYSCLOCK_CYCLE_TIME = 0.004 [s]

MD10070 \$MN_IPO_SYSCLOCK_TIME_RATIO = 3

-> Interpolator cycle time = 0.004 * 3 = 0.012 [s]

2. Calculation of the maximum velocity increase resulting from a change made to the temperature compensation parameter DvTmax

DvTmax = MD32000 \$MA_MAX_AX_VELO * MD32760 \$MA_COMP_ADD_VELO_FACTOR

Example: MD32000 \$MA_MAX_AX_VELO = 10 000 [mm/min]

MD32760 \$MA_COMP_ADD_VELO_FACTOR = 0.01

-> DvTmax = 10 000 * 0.01 = 100 [mm/min]

3. Calculation of the traverse distances per interpolator cycle

0.012

S1 (at vmax) = 10 000 x $\frac{0.012}{60}$ = 2.0 [mm]

0.012

ST (at DvTmax) = 100 x $\frac{0.012}{60}$ = 0.02 [mm]

4. Calculation of tanbmax

ST 0.02

tanbmax = $\frac{ST}{S1}$ = $\frac{0.02}{2}$ = 0.01 (corresponds to value for COMP_ADD_VELO_FACTOR)

-> bmax = arc tan 0.01 = 0.57 degrees

With larger values of SD43910 \$SA_TEMP_COMP_SLOPE, the maximum gradient (here 0.57 degrees) for the position-dependent temperature compensation value is used internally. There is no alarm.

Note:

Any additional excessive velocity resulting from temperature compensation must be taken into account when defining the limit value for velocity monitoring (MD36200 \$MA_AX_VELO_LIMIT).

32800	EQUIV_CURRCTRL_TIME			EXP, A07, A09	G1, K3, S3, A2, A3, G2, S1, V1	
s	Equiv. time const. current control loop for feedforward control			DOUBLE	NEW CONF	
-						
-	6	0.0005, 0.0005, 0.0005, 0.0005, 0.0005, 0.0005	-MD_DBLMAX	1.0E+301	7/2	M

Description:

The time constant is used for parameterizing the torque feedforward control and for calculating the dynamic following error model (contour monitoring).

In order to set the torque feedforward control correctly, the equivalent time constant of the current control loop must be determined exactly by measuring the step response of the current control loop.

Closed-loop control free of following errors can be set by inputting negative values when MD32620 \$MA_FFW_MODE=4 (but positioning overshoots may then occur).

Delay values taken into account automatically by the software internally are thus compensated again until the actually active minimum symmetrizing time "0" is reached.

Any other negative input values have no further effect.

Negative values input when MD32620 \$MA_FFW_MODE=2 are automatically converted internally to the input value "0", which means that they are not active in this case.

Related to:

32890	DESVAL_DELAY_ENABLE			A07	-	
-	Axial setpoint phase filter			BOOLEAN	NEW CONF	
CTEQ, -						
-	-	FALSE	-	-	7/2	M

Description:

With the axial setpoint phase filter (deadtime/delay), the phase response can be changed independent of the amplitude response (on the other hand, the conventional jerk filter - refer to MD32402 \$MA_AX_JERK_MODE - influences the amplitude and phase response simultaneously).

1: Setpoint phase filter (delay) is active.

0: Setpoint phase filter (delay) is inactive.

Corresponds with:

MD32895 \$MA_DESVAL_DELAY_TIME (time constant for the axial setpoint phase filter)

32895	DESVAL_DELAY_TIME			A07	-	
s	Time constant for the axial setpoint phase filter			DOUBLE	NEW CONF	
-						
-	2	0.0, 0.0	0.0	1.0E+301	7/2	M

Description:

The time constant for the phase filter (deadtime/delay) should be entered into the MD. This means that the actual setpoint phase response can be set independently of the amplitude response

Time constants in the range of 0 to 128 position control cycles can be set, the phase filter for 2ms position control cycle, for example, can delay setpoints by 0 to 256ms.

Values entered outside these limits are implicitly limited to the specified limits (without alarm).

Note: delays in the setpoint circuit, as a result of the system, slow down or have a negative impact on the response, e.g. for thread tapping, safety retraction motion or exact stop/block change; this means that the smallest time constants possible should be set in the MD.

Index 1 of the MD is only needed for a switchable jerk filter (two-digit input values in MD32402 \$MA_AX_JERK_MODE).

The MD is only effective, if MD32890 \$MA_DESVAL_DELAY_ENABLE = 1.

Related to:

MD32890 \$MA_DESVAL_DELAY_ENABLE (axial setpoint phase filter)

-	Dynamic response adaptation			BOOLEAN	NEW CONF	
CTEQ, -						
-	-	FALSE	0	-	7/2	M

Description: With dynamic response adaptation, axes with different servo gain factors can be set to the same following error with MD32910 \$MA_DYN_MATCH_TIME.

1: Dynamic response adaptation active.
 0: Dynamic response adaptation inactive.

Related to:
 MD32910 \$MA_DYN_MATCH_TIME[n]
 (time constant of dynamic response adaptation)

32910	DYN_MATCH_TIME			A07	G1, K3, S3, A2, A3, G2, S1, V1	
s	Time constant of dynamic response adaptation			DOUBLE	NEW CONF	
-						
-	6	0.0, 0.0, 0.0, 0.0, 0.0, 0.0	0.0	1.0E+301	7/2	M

Description: The time constant of the dynamic response adaptation of an axis has to be entered in this MD.

Axes interpolating with each other but having different dynamic responses can be adapted to the "slowest" control loop by means of this value.

The difference of the equivalent time constant of the "slowest" control loop to the individual axis has to be entered here as the time constant of the dynamic response adaptation.

The MD is only active if MD32900 \$MA_DYN_MATCH_ENABLE = 1.

Related to:
 MD32900 \$MA_DYN_MATCH_ENABLE (dynamic response adaptation)

32920	AC_FILTER_TIME			A10	-	
s	Smoothing filter time constant for adaptive control			DOUBLE	PowerOn	
-						
-	-	0.0	0.0	1.0E+301	7/2	M

Description: In the case of PROFIdrive drives (provided that they transport the following drive actual values in the PROFIdrive message frame, e.g. MD13060 \$MN_DRIVE_TELEGRAM_TYPE = 116):

With the main run variables \$AA_LOAD, \$AA_POWER, \$AA_TORQUE, and \$AA_CURR, the following drive actual values can be measured:

- Drive utilization
- Drive active power
- Drive torque setpoint value
- Current actual value of the axis or spindle

To compensate any peaks, the measured values can be smoothed with a PT1 filter. The filter time constant is defined with MD32920 \$MA_AC_FILTER_TIME (filter smoothing time constant for adaptive control).

When measuring the drive torque setpoint value or the actual current value, the filter is active in addition to the filters available in the drive. The two filters are connected in series, if both significantly and slightly smoothed values are required in the system. The filter is switched off when a smoothing time of 0 seconds is entered.

32925	LOAD_SMOOTH_FILTER_TIME			A10	-	
s	Filter time constant for smoothed drive utilization			DOUBLE	Immediately	
-						
-	-	0.0	0.0	1.0E+301	7/2	M

Description: For PROFIdrive drives (assuming that these can communicate the drive utilization in the PROFIdrive telegram, e.g. MD13060 \$MN_DRIVE_TELEGRAM_TYPE = 116):

In order to equalize peaks, the measured data values can be smoothed using a PT1 filter.

32950	POSCTRL_DAMPING	EXP, A07	G2
%	Damping of the speed control circuit.	DOUBLE	NEW CONF
-			
-	-	0.0	-
-	-	-	7/2
-	-		M

Description: Factor to additionally dampen the speed control loop
Purpose:
Damping an oscillating axis by additionally entering a differential position, which is derived from the difference of the two measuring systems.
Prerequisite: the axis must have two measuring systems, one encoder must be directly connected, the other indirectly.
Explanation of the scaling:
An input value of "100%" means the following: An additional torque corresponding to SINAMICS-p2003 is input, if

- for linear motors, there is a position difference of 1mm
- for rotary axes, there is a position difference of 360 degrees on the load side
- for linear axes (rot. drive), there is a position difference corresponding to MD31030 \$MA_LEADSCREW_PITCH (e.g. standard 10mm).

32960	POSCTRL_DUAL_FEEDBACK_TIME	EXP, A07	G2
s	Time constant for dual-position feedback	DOUBLE	NEW CONF
-			
-	-	0.0	0.0
		1.0E+301	7/2
			M

Description: Position control with position information from two measuring systems (only active if time constant is set > 0).

The direct measuring system (DM) becomes active with the delay time that can be set in this MD by means of PT1 filtering, at the same time the indirect measuring system (IM) becomes increasingly ineffective, so that, in total, exactly one measuring system acts at the position controller input at all times

Conditions:

- The axis must have two coupled measuring systems, of which one must be connected directly and the other indirectly to an encoder.
- The measuring systems must be calibrated, MD34102 \$MA_REFP_SYNC_ENCS = 1

33000	FIPO_TYPE	EXP, A07	G1, G3, S3, G2
-	Fine interpolator type	BYTE	PowerOn
CTEQ, -			
-	-	2	1
		3	7/2
			M

Description: The type of the fine interpolator has to be entered in this MD:

- 1: differential FIPO
- 2: cubic FIPO
- 3: cubic FIPO, optimized for operation with feedforward control

Calculation time required and contour quality increase with increasing type of FIPO.

- The default setting is the cubic FIPO.
- If no feedforward control is used in the position control loop, the use of the differential FIPO reduces the calculation time while slightly increasing the contour error.
- If the position control cycle and the interpolation cycle are identical, fine interpolation does not take place, i.e. the different types of fine interpolator do not have different effects.

33050	LUBRICATION_DIST	A03, A10	A2, Z1
mm, degrees	Traversing path for lubrication from PLC	DOUBLE	NEW CONF
-			
-	-	1.0e8	0.0
		1.0E+301	7/2
			I

Description: After the traversing path defined in the MD has been covered, the state of the axial interface signal "Lubrication pulse" is inverted, this can activate an automatic lubrication device.

The traversing path is summated after Power on.

The "Lubrication pulse" can be used with axes and spindles.

Application example(s):

The machine bed lubrication can be carried out as a function of the relevant traversed path.

Note:

When 0 is entered, the NC/PLC interface signal DB31, ... DBX76.0 (Lubrication pulse) is set in every cycle.

Related to:

NC/PLC interface signal DB31, ... DBX76.0 (Lubrication pulse)

33060	MAINTENANCE_DATA			A10	W6, 2.4, 6.2	
-	Configuration of maintenance data recording			DWORD	Reset	
-						
-	-	1	0	-	7/2	M

Description:

Configuration of axis maintenance data recording:

Bit 0:

Recording the entire traversing path, entire traversing time and number of axis traversing procedures

Bit 1:

Recording the entire traversing path, entire traversing time and number of traversing procedures at high axis speed

Bit 2:

Recording the total sum of axis jerks, the time in which the axis is traversed with jerk, and the number of traversing procedures with jerk.

33100	COMPRESS_POS_TOL			A10	F2, B1, K1	
mm, degrees	Maximum deviation during compression			DOUBLE	NEW CONF	
CTEQ						
-	-	0.1	1.e-9	1.0E+301	7/7	I

Description:

The value specifies the maximum permissible path deviation for each axis with compression.

The higher the value, the more short blocks can be compressed into a long block.

Not relevant for:

Active programmable contour/orientation tolerance (CTOL, OTOL, ATOL)

33120	PATH_TRANS_POS_TOL			A10	K1, PGA	
mm, degrees	Maximum deviation for smoothing with G645			DOUBLE	NEW CONF	
CTEQ						
-	-	0.005	1.e-9	1.0E+301	7/7	U

Description:

The value specifies the maximum permitted path deviation for smoothing with G645.

This is only relevant to tangential block transitions that are not acceleration-continuous.

For smoothing of corner with G645 tolerance MD33100 \$MA_COMPRESS_POS_TOL becomes active like with G642.

34000	REFP_CAM_IS_ACTIVE			A03, A11	G1, R1	
-	Axis with reference point cam			BOOLEAN	Reset	
-						
-	-	TRUE	0	-	7/2	M

Description:

1: There is at least one reference point cam for this axis

0: This axis does not have a reference point cam (e.g. rotary axis)

The referencing cycle starts immediately with phase 2 (see documentation)

Machine axes that have only one zero mark over the whole travel range or rotary axes that have only one zero mark per revolution do not require an additional reference cam that selects the zero mark (select MD34000 \$MA_REFP_CAM_IS_ACTIVE = 0).

The machine axis marked this way accelerates to the velocity specified in MD34040 \$MA_REFP_VELO_SEARCH_MARKER (reference point shutdown velocity) when the plus/minus traversing key is pressed, and synchronizes with the next zero mark.

34010	REFP_CAM_DIR_IS_MINUS			A03, A11	G1, R1	
-	Approach reference point in minus direction			BOOLEAN	Reset	
-						
-	-	FALSE	0	-	7/2	M

Description:

0: MD34010 \$MA_REFP_CAM_DIR_IS_MINUS Reference point approach in plus direction
1: MD34010 \$MA_REFP_CAM_DIR_IS_MINUS Reference point approach in minus direction

For incremental measuring systems:

If the machine axis is positioned in front of the reference cam, it accelerates, depending on the plus/minus traversing key pressed, to the velocity specified in MD34020 \$MA_REFP_VELO_SEARCH_CAM (reference point approach velocity) in the direction specified in MD34010 \$MA_REFP_CAM_DIR_IS_MINUS. If the wrong traversing key is pressed, reference point approach is not started.

If the machine axis is positioned on the reference cam, it accelerates to the velocity specified in MD34020 \$MA_REFP_VELO_SEARCH_CAM and travels in the direction opposite to that specified in MD34010 \$MA_REFP_CAM_DIR_IS_MINUS.

For linear measuring systems with distance-coded reference marks:

If the machine axis has a reference cam (linear measuring systems with distance-coded reference marks do not necessarily require a reference cam) and the machine axis is positioned on the reference cam, it accelerates, irrespectively of the plus/minus traversing key pressed, to the velocity specified in MD34040 \$MA_REFP_VELO_SEARCH_MARKER (reference point creep velocity) in the direction opposite to that specified in MD34010 \$MA_REFP_CAM_DIR_IS_MINUS.

34020	REFP_VELO_SEARCH_CAM			A03, A11, A04	G1, R1	
mm/min, rev/min	Reference point approach velocity			DOUBLE	Reset	
-						
-	-	(5000.0/10.0), (5000.0/10.0), (5000.0/10.0), (5000.0/10.0), (500...	(0./ 0.)	(MD_DBLMAX/ MD_DBLMAX)	7/2	M

Description:

The reference point approach velocity is the velocity at which the machine axis travels in the direction of the reference cam after the traversing key has been pressed (phase 1). This value should be set at a magnitude large enough for the axis to be stopped to 0 before it reaches a hardware limit switch.

MD irrelevant for:

Linear measuring systems with distance-coded reference marks

34030	REFP_MAX_CAM_DIST			A03, A11	G1, R1	
mm, degrees	Maximum distance to reference cam			DOUBLE	Reset	
-						
-	-	10000.0	0.0	1.0E+301	7/2	M

Description:

If the machine axis travels a maximum distance defined in MD34030 \$MA_REFP_MAX_CAM_DIST from the starting position in the direction of the reference cam, without reaching the reference cam (NC/PLC interface signal DB31, ... DBX12.7 (Reference point approach delay) is reset), the axis stops and alarm 20000 "Reference cam not reached" is output.

Irrelevant to:

Linear measuring systems with distance-coded reference marks

2.3 NC machine data

34040	REFP_VELO_SEARCH_MARKER			A03, A11, A04	G1, R1, S1	
mm/min, rev/min	Shutdown velocity			DOUBLE	Reset	
-						
-	2	(300.0/ 300.0)/ (1.0/ 1.0), (300.0/ 300.0)/ (1.0/ 1.0), (300.0/ ...	(0./ 0.)	(MD_DBLMAX/ MD_DBLMAX)	7/2	M

Description:

1) For incremental measuring systems:

This is the velocity at which the axis travels during the time between initial detection of the reference cam and synchronization with the first zero mark (phase 2).
Traversing direction: Opposite to the direction specified for the cam search (MD34010 \$MA_REFP_CAM_DIR_IS_MINUS)

If MD34050 \$MA_REFP_SEARCH_MARKER_REVERSE (direction reversal on reference cam) is enabled, then if the axis is synchronized with a rising reference cam signal edge on the cam, the axis traverses at the velocity defined in MD34020 \$MA_REFP_VELO_SEARCH_CAM.

2) Indirect measuring system with BERO on the load-side (preferred for spindles):

At this velocity, a search is made for the zero mark associated with the BERO (zero mark selection per VDI signal). The zero mark is accepted if the actual velocity lies within the tolerance range defined in MD35150 \$MA_SPIND_DES_VELO_TOL as a deviation from the velocity specified in MD34040 \$MA_REFP_VELO_SEARCH_MARKER[n].

3) For linear measuring systems with distance-coded reference marks:

The axis crosses the two reference marks at this velocity. The maximum velocity must be low enough to ensure that the time required to travel the smallest possible reference mark distance [x(minimum)] on the linear measuring system is longer than one position controller cycle.

The formula

$$[x(\text{minimum})] \text{ [mm]} = \frac{\text{Basic dist.}^2}{2} \cdot \text{Grad.cycle} - \frac{\text{Meas.length}}{\text{Basic dist.}}$$

with Basic distance [multiple of graduation cycle]

Graduation cycle [mm]

Measuring length [mm] yields:

x(minimum) [mm]

$$\text{max. velocity [m/s]} = \frac{\text{Position controller cycle [ms]}}{\text{Position controller cycle [ms]}}$$

This limiting value consideration also applies to the other measuring systems.

Traversing direction:

- as defined in MD34010 \$MA_REFP_CAM_DIR_IS_MINUS;
- if the axis is already positioned on the cam, the axis is traversed in the opposite direction

34050	REFP_SEARCH_MARKER_REVERSE			A03, A11	G1, R1	
-	Direction reversal to reference cam			BOOLEAN	Reset	
-						
-	2	FALSE, FALSE	0	-	7/2	M

Description:

This MD can be used to set the direction of search for the zero mark:

MD34050 \$MA_REFP_SEARCH_MARKER_REVERSE = 0

Synchronization with falling reference cam signal edge

The machine axis accelerates to the velocity specified in MD34040

\$MA_REFP_VELO_SEARCH_MARKER (reference point shutdown velocity) in the opposite direction to that specified in MD34010 \$MA_REFP_CAM_DIR_IS_MINUS (reference point approach in minus direction).

If the axis leaves the reference cam (NC/PLC interface signal DB31, ... DBX12.7 (Reference point approach delay) is reset) the control is synchronized with the first zero mark.

MD34050 \$MA_REFP_SEARCH_MARKER_REVERSE = 1

Synchronization with rising reference cam signal edge

The machine axis accelerates to the velocity defined in MD34020

\$MA_REFP_VELO_SEARCH_CAM (reference point creep velocity) in the opposite direction to that specified in the MD34010 \$MA_REFP_CAM_DIR_IS_MINUS. If the axis leaves the reference cam (NC/PLC interface signal DB31, ... DBX12.7 (Reference point approach delay) is reset), the machine axis decelerates to a halt and accelerates in the opposite direction towards the reference cam at the velocity specified in MD34040: \$MA_REFP_VELO_SEARCH_MARKER. When the reference cam is reached (NC/PLC interface signal DB31, ... DBX12.7 (Reference point approach delay) is enabled) the control is synchronized with the first zero mark.

MD irrelevant to:

Linear measuring systems with distance-coded reference marks

34060	REFP_MAX_MARKER_DIST			A03, A11	G1, R1, S1	
mm, degrees	Maximum distance to reference mark			DOUBLE	Reset	
-						
-	2	(20.0/ 20.0)/(720.0/ 720.0), (20.0/ 20.0)/(720.0/ 720.0), (20.0/...	(0./ 0.)	(MD_DBLMAX/ MD_DBLMAX)	7/2	M

Description:

For incremental measuring systems:

If, after leaving the reference cam (NC/PLC interface signal DB31, ... DBX12.7 (Reference point approach delay) is reset), the machine axis travels a distance defined in MD34060: \$MA_REFP_MAX_MARKER_DIST without detecting the zero mark, the axis stops and alarm 20002 "Zero mark missing" is output.

For linear measuring systems with distance-coded reference marks:

If the machine axis travels a distance defined in MD34060 \$MA_REFP_MAX_MARKER_DIST from the starting position without crossing two zero marks, the axis stops and alarm 20004 "Reference mark missing" is output.

34070	REFP_VELO_POS			A03, A11, A04	G1, R1	
mm/min, rev/min	Reference point positioning velocity			DOUBLE	Reset	
-						
-	-	(10000.0/ 20.0), (10000.0/ 20.0), (10000.0/ 20.0), (10000.0/ 20....	(0./ 0.)	(MD_DBLMAX/ MD_DBLMAX)	7/2	M

Description:

For incremental measuring systems:

The axis travels at this velocity between the time of synchronization with the first zero mark and arrival at the reference point.

For linear measuring systems with distance-coded reference marks:

The axis travels at this velocity between the time of synchronization (crossing two zero marks) and arrival at the target point.

34080	REFP_MOVE_DIST			A03, A11	G1, R1, S1, S3, G2	
mm, degrees	Reference point distance			DOUBLE	NEW CONF	
-						
-	2	-2.0, -2.0	-1e15	1e15	7/2	I

Description:

1. Standard measuring system (incremental with equidistant zero marks)

Reference point positioning movement: 3rd phase of the reference point approach:

2.3 NC machine data

The axis traverses from the position at which the zero mark is detected with the velocity REFP_AX_VELO_POS along the path REFP_MOVE_DIST + REFP_MOVE_DIST_CORR (relative to the marker).

REFP_SET_POS is set as the current axis position at the target point.

2. Irrelevant for distance-coded measuring system.

Override switch and selection jog/continuous mode (MD JOG_INC_MODE_IS_CONT) are active.

34090	REFP_MOVE_DIST_CORR			A03, A02, A08, A11	G1, R1, S1, S3, G2	
mm, degrees	Reference point offset/absolute offset			DOUBLE	NEW CONF	
-, -						
-	2	0.0, 0.0	-1e12	1e12	7/2	I

Description:

- Incremental encoder with zero mark(s):

After detection of the zero mark, the axis is positioned away from the zero mark by the distance specified in MD34080 \$MA_REFP_MOVE_DIST + MD34090 \$MA_REFP_MOVE_DIST_CORR. After traversing this distance, the axis has reached the reference point. MD34100 \$MA_REFP_SET_POS is transferred into the actual value.

During traversing by MD34080 \$MA_REFP_MOVE_DIST + MD34090 \$MA_REFP_MOVE_DIST_CORR, the override switch and MD11300 \$MN_JOG_INC_MODE_LEVELTRIGGRD (jog/continuous mode) are active.

- Distance-coded measuring system:

MD34090 \$MA_REFP_MOVE_DIST_CORR acts as an absolute offset. It describes the offset between the machine zero and the first reference mark of the measuring system.

- Absolute encoder:

MD34090 \$MA_REFP_MOVE_DIST_CORR acts as an absolute offset.

It describes the offset between the machine zero and the zero point of the absolute measuring system.

Note:

In conjunction with absolute encoders, this MD is modified by the control during calibration processes and modulo offset.

With rotary absolute encoders (on linear and rotary axes), the modification frequency also depends on the setting of MD34220 \$MA_ENC_ABS_TURNS_MODULO.

Manual input or modification of this MD via the part program should therefore be followed by a Power ON Reset to activate the new value and prevent it from being lost.

The following applies to an NCU-LINK:

If a link axis uses an absolute encoder, every modification of MD34090 \$MA_REFP_MOVE_DIST_CORR on the home NCU (servo physically available) is updated only locally and not beyond the limits of the NCU. The modification is therefore not visible to the link axis. Writing MD34090 \$MA_REFP_MOVE_DIST_CORR through the link axis is rejected with alarm 17070.

34092	REFP_CAM_SHIFT			A03, A11	G1, R1	
mm, degrees	Electronic cam offset for incremental measuring systems			DOUBLE	Reset	
-						
-	2	0.0, 0.0	0.0	1.0E+301	7/2	I

Description:

Electronic cam offset for incremental measuring systems with equidistant zero marks.

When the reference cam signal occurs, the zero mark search does not start immediately but is delayed until after the distance from REFP_CAM_SHIFT.

This ensures the reproducibility of the zero mark search through a defined selection of a zero mark, even with temperature-dependent expansion of the reference cam.

Because the reference cam offset is calculated by the control in the interpolation cycle, the actual cam offset is at least REFP_CAM_SHIFT and at most REFP_CAM_SHIFT+ (MD34040 \$MA_REFP_VELO_SEARCH_MARKER*interpolation cycle)

The reference cam offset is effective in the search direction of the zero mark.

The reference cam offset is only active if existing cam MD34000

\$MA_REFP_CAM_IS_ACTIVE=1.

34093	REFP_CAM_MARKER_DIST	A03, A11	R1
mm, degrees	Reference cam/reference mark distance	DOUBLE	PowerOn
-			
-	2	0.0, 0.0	-MD_DBLMAX 1.0E+301 ReadOnly I

Description:

The value displayed corresponds to the distance between exiting the reference cam and the occurrence of the reference mark. If the values are too small, there is a risk of not being able to determine the reference point due to temperature reasons or varying operating times of the cam signal. The distance travelled may serve as a clue for setting the electronic reference cam offset.

This machine data is a display data and can therefore not be changed.

34100	REFP_SET_POS	A03, A11	G1, S3, G2, R1, S1
mm, degrees	Reference point for incremental system	DOUBLE	Reset
-			
-	4	0., 0., 0., 0.	-45000000 45000000 7/2 I

Description:

- Incremental encoder with zero mark(s):
The position value which is set as the current axis position after detection of the zero mark and traversal of the distance REFP_MOVE_DIST + REFP_MOVE_DIST_CORR (relative to zero mark). REFP_SET_POS of the reference point number, which is set at the instant that the edge of the reference cam signal rises (NC/PLC interface signal DB31, _DBX2.4 - 2.7 (Reference point value 1 to 4)), is set as the axis position.

- Distance-coded measuring system:

Target position which is approached when MD34330 \$MA_REFP_STOP_AT_ABS_MARKER is set to 0 (FALSE) and two zero marks have been crossed.

- Absolute encoder:

MD34100 \$MA_REFP_SET_POS corresponds to the correct actual value at the calibration position.

The reaction on the machine depends on the status of MD34210 \$MA_ENC_REFP_STATE: When MD34210 \$MA_ENC_REFP_STATE = 1, the value of MD34100 \$MA_REFP_SET_POS is transferred as the absolute value.

When MD34210 \$MA_ENC_REFP_STATE = 2 and MD34330 \$MA_REFP_STOP_AT_ABS_MARKER = 0 (FALSE), the axis approaches the target position stored in MD34100 \$MA_REFP_SET_POS.

The value of MD34100 \$MA_REFP_SET_POS that has been set via NC/PLC interface signal DB31, _DBX2.4 - 2.7 (Reference point value 1 to 4) is used.

Related to:

NC/PLC interface signal DB31, _DBX2.4 - 2.7 (Reference point value 1 to 4)

34102	REFP_SYNC_ENCS	A03, A02	R1, Z1
-	Calibration of measuring systems	BYTE	Reset
-			
-	-	0 0 1	7/2 M

Description:

Calibrating the measuring system to the reference measuring system can be activated for all measuring systems of this axis with this machine data.

The calibration procedure is made during reference point approach or when calibrated absolute encoders selected for the closed-loop control are switched on.

Values:

0: No measuring system calibration, measuring systems must be referenced individually

2.3 NC machine data

1: Calibration of all measuring systems of the axis to the position of the reference measuring system

In combination with MD30242 \$MA_ENC_IS_INDEPENDENT = 2, the passive encoder is calibrated to the active encoder but NOT referenced.

34104	REFP_PERMITTED_IN_FOLLOWUP			A03, A02	R1	
-	Enable referencing in follow-up mode			BOOLEAN	Reset	
-						
-	-	FALSE	0	-	7/2	M

Description: An axis can also be referenced in the follow-up mode under JOG+REF mode by means of an external motion.

34110	REFP_CYCLE_NR			A03	G1, TE3, D1, R1, Z1	
-	Sequence of axes in channel-specific referencing			DWORD	Reset	
-						
-	-	1, 2, 3, 4, 5, 6, 7, 8...	-1	31	7/2	M

Description: MD34110 \$MA_REFP_CYCLE_NR = 0 -----> axis-specific referencing
 Axis-specific referencing is started separately for each machine axis with the NC/PLC interface signal DB31, ... DBX4.7 / 4.6 (Plus/minus travel keys).
 Up to 8 axes (840D) can be referenced simultaneously.
 The following alternatives are provided for referencing the machine axes in a specific sequence:

- The operator has to observe the correct sequence on startup.
- The PLC checks the sequence on startup or defines the sequence itself.
- The channel-specific referencing function is used.

MD34110 \$MA_REFP_CYCLE_NR = 1 -----> channel-specific referencing
 Channel-specific referencing is started with the NC/PLC interface signal DB21-30 DBX1.0 (Activate referencing). The control acknowledges a successful start with the NC/PLC interface signal DB21-30 DBX33.0 (Referencing active). Each machine axis assigned to the channel can be referenced with channel-specific referencing (this is achieved internally on the control by simulating the plus/minus traversing keys). The axis-specific MD34110 \$MA_REFP_CYCLE_NR can be used to define the sequence in which the machine axes are referenced:

-1 means:
 The machine axis is not started by channel-specific referencing, and NC start is possible without referencing this axis.

0 means:
 The machine axis is not started by channel-specific referencing, and NC start is not possible without referencing this axis.

1 means:
 The machine axis is started by channel-specific referencing.

2 means:
 The machine axis is started by channel-specific referencing if all machine axes identified by a 1 in MD34110 \$MA_REFP_CYCLE_NR are referenced.

3 means:
 The machine axis is started by channel-specific referencing if all machine axes identified by a 2 in MD34110 \$MA_REFP_CYCLE_NR are referenced.

4 to 8 :
 As above for further machine axes.

Setting the channel-specific MD20700 \$MC_REF_NC_START_LOCK (NC start disable without reference point) to zero has the effect of entering -1 for all the axes of a channel.
 MD irrelevant to:

Axis-specific referencing

Related to:

NC/PLC interface signal DB21-30 DBX1.0 (Activate referencing)

NC/PLC interface signal DB21-30 DBX33.0 (Referencing active)

34200	ENC_REFP_MODE			A03, A02	G1, R1, S1	
-	Referencing mode			BYTE	PowerOn	
-						
-	2	1, 1	0	8	7/2	M

Description:

The mounted position measuring systems can be classified for referencing as follows with MD34200 \$MA_ENC_REFP_MODE:

- MD34200 \$MA_ENC_REFP_MODE = 0
If an absolute encoder is available: MD34100 \$MA_REFP_SET_POS is taken over
Other encoders: Reference point approach not possible (SW2.2 and higher)
- MD34200 \$MA_ENC_REFP_MODE = 1
Referencing of incremental, rotary or linear measuring systems:
Zero pulse on the encoder track
Referencing of absolute, rotary measuring systems:
Replacement zero pulse based on the absolute information
- MD34200 \$MA_ENC_REFP_MODE = 3
Referencing of rotary or linear measuring systems with distance-coded reference marks:
Measuring system with distance-coded reference marks (as specified by Heidenhain)
- MD34200 \$MA_ENC_REFP_MODE = 4 :
Reserved (BERO with 2-edge evaluation)
- MD34200 \$MA_ENC_REFP_MODE = 8:
Referencing of rotary or linear measuring systems with distance-coded reference marks:
Measuring system with distance-coded reference marks (according to specification of Heidenhain) over 4 zero marks (increased safety).

34210	ENC_REFP_STATE			A07, A03, A02	R1	
-	Adjustment status of absolute encoder			BYTE	Immediately	
-						
-	2	0. 0	0	3	7/4	I

Description:

- Absolute encoder:
This machine data contains the absolute encoder status
0: Encoder is not calibrated
1: Encoder calibration enabled (but not yet calibrated)
2: Encoder is calibrated
Default setting for recommissioning: Encoder is not calibrated.
3: No significance, has the same effect as "0"
- Incremental encoder:
This machine data contains the "Referenced status", which can be saved beyond Power On:
0: Default setting: No automatic referencing
1: Automatic referencing enabled, but encoder not yet referenced
2: Encoder is referenced and at exact stop, automatic referencing becomes active at the next encoder activation
3: The last axis position buffered before switch off is restored, no automatic referencing
Default setting for recommissioning: No automatic referencing

2.3 NC machine data

34220	ENC_ABS_TURNS_MODULO			A03, A02	R1	
-	Modulo range for rotary absolute encoder			DWORD	PowerOn	
-						
-	2	4096, 4096	1	100000	7/2	M

Description: Number of encoder revolutions a rotary absolute encoder is able to resolve (see also the maximum multiturn information of the absolute encoder, see encoder data sheet or PROFIdrive parameter P979).

The absolute position of a rotary axis is reduced to this resolvable range when an absolute encoder is switched on:

In other words, a MODULO transformation takes place if the actual position sensed is larger than the position permitted by MD ENC_ABS_TURNS_MODULO.

0 degrees <= position <= n*360 degrees (with n = ENC_ABS_TURNS_MODULO)

Note:

With SW 2.2, the position is reduced to this range when the control/encoder is switched on. With SW 3.6 and higher, half of this value represents the maximum permissible travel distance with the control switched off/the encoder inactive.

Special cases:

For PROFIdrive, any integer value is permissible.

The MD is relevant only for rotary encoders (on linear and rotary axes).

Corresponds to:

PROFIdrive parameter P979

34230	ENC_SERIAL_NUMBER			A02	R1	
-	Encoder serial number			DWORD	PowerOn	
-						
-	2	0, 0	-	-	7/2	I

Description: The encoder serial number (EnDat encoders) can be read out here.

It is updated at PowerOn or when parking is deselected.

"0" is supplied for encoders which do not have a serial number available.

Manipulating this MD normally causes automatic absolute encoder maladjustment (MD34210 \$MA_ENC_REFP_STATE returns to "0").

34300	ENC_REFP_MARKER_DIST			A03, A02	R1	
mm, degrees	Basic distance of reference marks of distance-coded encoders.			DOUBLE	NEW CONF	
-						
-	2	10.0, 10.0	0.0	1.0E+301	7/2	M

Description: In addition to the incremental encoder track, a further encoder track is available with distance-coded measuring systems for determining the absolute encoder position. This encoder track has reference marks at defined, different distances. The basic distance between the fixed reference marks (which are the reference marks that are always the same distance from one another) can be taken from the data sheet, and directly transferred into machine data MD34300 \$MA_ENC_REFP_MARKER_DIST.

With the basic distance between the fixed reference marks (MD34300 \$MA_ENC_REFP_MARKER_DIST), the distance between two reference marks (MD34310 \$MA_ENC_MARKER_INC), and the number of encoder pulses (MD31020 \$MA_ENC_RESOL) on angular measuring systems or the graduation cycle (MD31010 \$MA_ENC_GRID_POINT_DIST) on linear measuring systems, the absolute encoder position can be determined once two successive reference marks have been crossed.

MD34300 \$MA_ENC_REFP_MARKER_DIST is also used for a plausibility check of reference mark distances.

Examples of application:

For example: Heidenhain LS186 C

MD 31010 = 0.02mm (graduation cycle)

MD 34300 = 20.00mm (basic distance between the reference marks)

MD 34310 = 0.02mm (distance between two reference marks corresponds to one graduation cycle).

34310	ENC_MARKER_INC			A03, A02	R1	
mm, degrees	Interval between two reference marks for distance-coded encoders			DOUBLE	NEW CONF	
-						
-	2	0.02, 0.02	0.0	1.0E+301	7/2	M

Description:

The distances between two reference marks are defined variably, so that the position of the crossed reference marks can be determined accurately in measuring systems with distance-coded reference marks.

The difference between two reference mark distances is entered in MD34310

\$MA_ENC_MARKER_INC.

MD irrelevant for:

Incremental measuring systems

Special cases:

On measuring systems with distance-coded reference marks supplied by Heidenhain, the interval between two reference marks is always equal to one graduation cycle.

34320	ENC_INVERS			A03, A02	G2, R1	
-	Distance-coded encoder is inverse to the axis movement			BOOLEAN	NEW CONF	
-						
-	2	FALSE, FALSE	0	-	7/2	M

Description:

- In the case of a distance-coded measuring system:

When setting a reference point, the actual position (determined by the distance-coded reference marks) on the measuring system is assigned to an exact machine axis position (referred to the machine zero point). The absolute offset between the machine zero point and the position of the 1st reference mark on the measuring system must therefore be entered in MD34090 \$MA_REFP_MOVE_DIST_CORR (reference point/absolute offset). In addition, MD34320 \$MA_ENC_INVERS must be used to set whether the measuring system is connected in the same or the opposite direction to the machine system.

MD irrelevant to:

Incremental encoders without distance-coded reference marks.

34330	REFP_STOP_AT_ABS_MARKER			A03	G1, R1	
-	Distance-coded linear measuring system without target point			BOOLEAN	Reset	
-						
-	2	TRUE, TRUE	0	-	7/2	M

Description:

- Distance-coded measuring system:

REFP_STOP_AT_ABS_MARKER = 0:

At the end of the reference cycle, the position entered in MD34100 \$MA_REFP_SET_POS is approached (normal case for phase 2).

REFP_STOP_AT_ABS_MARKER = 1:

The axis is braked after detection of the second reference mark (shortening of phase 2)

- Absolute encoder:

MD34330 \$MA_REFP_STOP_AT_ABS_MARKER defines the response of an axis with a valid calibration identifier (MD34210 \$MA_ENC_REFP_STATE = 2) with G74 or when a traversing key is actuated in JOG-REF:

REFP_STOP_AT_ABS_MARKER = 0:

2.3 NC machine data

Axis traverses to the position entered in MD34100 \$MA_REFP_SET_POS
 REFP_STOP_AT_ABS_MARKER = 1:
 Axis does not traverse.
 MD irrelevant for:
 Incremental encoders with zero mark (standard encoders)
 Related to:
 MD34100 \$MA_REFP_SET_POS
 (reference point distance/target point for distance-coded system)

34800	WAIT_ENC_VALID			A01	-	
-	Parameter setting for part program command WAITENC			DWORD	PowerOn	
-						
-	-	0	0	1	7/2	M

Description: Parameter setting for part program command WAITENC:
 0: Axis is not taken into account when waiting for synchronized / referenced or restored position with part program command WAITENC.
 1: A delay is applied in part program command WAITENC until a synchronized / referenced or restored position is available for this axis.

34990	ENC_ACTVAL_SMOOTH_TIME			A02	V1	
s	Smoothing time constant for actual values.			DOUBLE	Reset	
-						
-	2	0.0, 0.0	0.0	0.5	7/2	I

Description: Using low-resolution encoders, a more continuous motion of coupled path or axis motions can be achieved with smoothed actual values. The bigger the time constant, the better the smoothing of actual values and the larger the overtravel.
 Smoothed actual values are used for:

- Thread-cutting (G33, G34, G35)
- Revolutional feedrate (G95, G96, G97, FPRAON)
- Display of actual position and velocity, or speed respectively.

35000	SPIND_ASSIGN_TO_MACHAX			A01, A06, A11	M1, S3, K2, S1	
-	Assignment of spindle to machine axis			BYTE	PowerOn	
-						
-	-	0, 0, 0, 0, 0, 0, 0, 0...	0	20	7/2	M

Description: Spindle definition. The spindle is defined when the spindle number has been entered in this MD.
 Example:
 If the corresponding axis is to be spindle 1, value "1" must be entered in this MD.
 The spindle functions are possible only for modulo rotary axes. For this purpose MD30300 \$MA_IS_ROT_AX and MD30310 \$MA_ROT_IS_MODULO must be set.
 The axis functionality is maintained; transition to axis operation can be performed with M70.
 The gear stage-specific spindle data are set in parameter blocks 1 to 5; parameter block 0 is used for axis operation (MD35590 \$MA_PARAMSET_CHANGE_ENABLE).
 The lowest spindle number is 1, the highest number depends on the number of axes in the channel.
 If other spindle numbers are to be assigned, the function "spindle converter" must be used.
 With multi-channel systems, the same numbers can be assigned in all channels, except for those spindles active in several channels (replacement axes/spindles MD 30550: \$MA_AXCONF_ASSIGN_MASTER_CHAN).

35010	GEAR_STEP_CHANGE_ENABLE			A06, A11	P3 pl, P3 sl, S1	
-	Parameterize gear stage change			UDWORD	Reset	
CTEQ						
-	-	0x00	0	0x2B	7/2	M

Description:

Meaning of bit places:

Bit 0 = 0 and bit 1 = 0:

There is an invariable gear ratio between motor and load. The MD of the first gear stage is active. Gear stage change is not possible with M40 to M45.

Bit 0 = 1:

Gear stage change at undefined change position. The gear can have up to 5 gear stages, which can be selected with M40, M41 to M45. To support the gear stage change, the motor can carry out oscillating motions, which must be enabled by the PLC program.

Bit 1 = 1:

Same meaning as bit 0 = 1, although the gear stage change is carried out in a configured spindle position (SW 5.3 and higher). The change position is configured in MD35012 \$MA_GEAR_STEP_CHANGE_POSITION. The position is approached in the current gear stage before the gear stage change. If this bit is set, bit 0 is not taken into account!

Bit 2: Reserved

Bit 3 = 1:

The gear stage change dialog between NCK and PLC is simulated. The setpoint gear stage is output to the PLC. A checkback signal from the PLC is not awaited. The acknowledgment is generated internally in the NCK.

Bit 4: Reserved

Bit 5 = 1:

The second gear stage data set is used for tapping with G331/G332. The bit must be set for the master spindle used for tapping. Bit 0 or bit 1 must be set.

Related to:

MD35090 \$MA_NUM_GEAR_STEPS (number of gear stages 1st data set, see bit 5)

MD35092 \$MA_NUM_GEAR_STEPS2 (number of gear stages 2nd data set, see bit 5)

MD35110 \$MA_GEAR_STEP_MAX_VELO (max. speed for autom. gear stage change)

MD35112 \$MA_GEAR_STEP_MAX_VELO2 (max. speed for autom. gear stage change 2nd data set, see bit 5)

MD35120 \$MA_GEAR_STEP_MIN_VELO (min. speed for autom. gear stage change)

MD35122 \$MA_GEAR_STEP_MIN_VELO2 (min. speed for autom. gear stage change 2nd data set, see bit 5)

35012	GEAR_STEP_CHANGE_POSITION			A06, A11	S1	
mm, degrees	Gear stage change position			DOUBLE	NEW CONF	
CTEQ						
-	6	0.0, 0.0, 0.0, 0.0, 0.0, 0.0	0.0	1.0E+301	7/2	M

Description:

Gear stage change position.

The value range must be within the configured modulo range.

Related to:

MD35010 \$MA_GEAR_STEP_CHANGE_ENABLE, bit 1

MD30330 \$MA_MODULO_RANGE

2.3 NC machine data

35014	GEAR_STEP_USED_IN_AXISMODE			A01, A06, A11	-	
-	Gear stage for axis mode with M70			DWORD	NEW CONF	
CTEQ						
-	-	0	0	5	7/2	M

Description:

With this MD, a gear stage can be defined which can be loaded into the axis mode during the transition with M70. The parameter set zero used in axis mode is to be optimized on this gear stage.

Significance of the values:

0: There is no implicit gear stage change with M70.

The current gear stage is retained.

1 ... 5:

There is a change into gear stage (1...5) during the execution of M70.

During the transition into axis mode without M70, there is monitoring for this gear stage and alarm 22022 is issued if necessary. The condition for a gear stage change is the general release of the function in MD35010 \$MA_GEAR_STEP_CHANGE_ENABLE.

Secondary conditions:

When changing from axis mode into spindle mode, the configured gear stage continues to remain active. There is no automatic return to the last active gear stage in spindle mode.

35020	SPIND_DEFAULT_MODE			A06, A10	S1	
-	Initial spindle setting			BYTE	Reset	
CTEQ						
-	-	0	0	3	7/2	M

Description:

SPIND_DEFAULT_MODE activates the set operating mode of the spindle at the time specified in MD35030 \$MA_SPIND_DEFAULT_ACT_MASK. The appropriate spindle operating modes can be set with the following values:

0 Speed mode, position control deselected

1 Speed mode, position control activated

2 Positioning mode, no check for synchronized/referenced position on NC start

3 Axis mode, MD34110 \$MA_REFP_CYCLE_NR can be used to configure / deactivate forced referencing on NC start

Corresponds with:

MD35030 \$MA_SPIND_DEFAULT_ACT_MASK (activate spindle initial setting)

MD20700 \$MC_REFP_NC_START_LOCK (NC start disable without reference point)

35030	SPIND_DEFAULT_ACT_MASK			A06, A10	S1	
-	Time at which initial spindle setting is effective			UBYTE	Reset	
CTEQ						
-	-	0x00	0	0x03	7/2	M

Description:

SPIND_DEFAULT_ACT_MASK specifies the time at which the operating mode defined in MD35020 \$MA_SPIND_DEFAULT_MODE becomes effective. The initial spindle setting can be assigned the following values at the following points in time:

0 POWER ON

1 POWER ON and NC program start

2 POWER ON and RESET (M2/M30)

Special cases:

If MD35040 \$MA_SPIND_ACTIVE_AFTER_RESET = 1, the following supplementary conditions are applicable:

- SPIND_DEFAULT_ACT_MASK should be set to 0
- If this is not possible, the spindle must be at a standstill prior to activation.

Related to:

MD35020 \$MA_SPIND_DEFAULT_MODE (initial spindle setting)

-	Spindle functions			UDWORD	Reset	
CTEQ						
-	-	0x510	0	0x7FFFFFFF	7/2	M

Description: This MD allows spindle-specific functions to be set.
 The MD is bit-coded, the following bits are assigned:
 Bit 0 = 1: Gear stage changes are suppressed with activated DryRun function for block programming (M40, M41 to M45), programming via FC18, and synchronized actions.
 Bit 1 = 1: Gear stage changes are suppressed with activated program test function for block programming (M40, M41 to M45), programming via FC18, and synchronized actions.
 Bit 2 = 1: Gear stage change for programmed gear stage will finally be carried out after deselection of DryRun or program test functions with REPOS.
 Bit 3: reserved
 Bit 4 = 1:
 The programmed speed is transferred to SD 43200 \$SA_SPIND_S (incl. speed default settings via FC18 and synchronized actions).
 S programmings that are not speed programmings are not written to the SD. These include, for example, S value with constant cutting speed (G96, G961), S value with revolution-related dwell time (G4).
 Bit 5 = 1:
 The content of SD 43200 \$SA_SPIND_S is applied as the speed setpoint for JOG. If the content is zero, then other JOG speed default settings become active (see SD 41200 JOG_SPIND_SET_VELO).
 Bit 6: reserved
 Bit 7: reserved
 Bit 8 = 1:
 The programmed cutting speed is transferred to SD 43202 \$SA_SPIND_CONSTCUT_S (incl. default settings via FC18). S programmings, that are not cutting speed programmings, are not written to the SD. These include, for example, S value outside of constant cutting speed (G96, G961, G962), S value with revolution-related dwell time (G4), S value in synchronized actions.
 Bit 9: reserved
 Bit 10 = 0:
 SD 43206 \$SA_SPIND_SPEED_TYPE is not changed by part program or channel settings,

2.3 NC machine data

= 1:

For the master spindle, the value of the 15th G group (type of feedrate) is transferred to SD 43206 \$SA_SPIND_SPEED_TYPE. For all other spindles, the corresponding SD remains unchanged.

Bit 11: reserved

Bit 12 = 1:

Spindle override is active with zero mark search for M19, SPOS, and SPOSA

= 0:

Previous response (default)

The following bits 16-20 can be used to set spindle-specific M functions which are output to the VDI interface

if the corresponding M functionality has been generated implicitly for the program sequence.

Bit 16: reserved

Bit 17: reserved

Bit 18: reserved

Bit 19: "Output implicit M19 to PLC"

= 0: If MD20850 \$MC_SPOS_TO_VDI = 0 too, no auxiliary function M19 is generated for SPOS and SPOSA. As a result, the acknowledgment time for the auxiliary function is also eliminated. This can cause problems in the case of short blocks.

= 1: The implicit auxiliary function M19 is generated with the programming of SPOS and SPOSA and output to the PLC. The address is expanded in accordance with the spindle number.

Bit 20: "Output implicit M70 to PLC"

= 0: No generation of implicit auxiliary function M70. Note: A programmed auxiliary function M70 is always output to the PLC.

= 1: Auxiliary function M70 is generated implicitly and output to the PLC on transition to axis mode. The address is expanded in accordance with the spindle number.

Bit 21: reserved

Bit 22 = 0: As of NCK version 78.00.00: The NC/PLC interface signal DB31, ... DBX17.6 (invert M3/M4) is applied to the function for interpolatory tapping G331/G332.

Bit 22 = 1: Response is compatible with SW releases prior to NCK version 78.00.00: The NC/PLC interface signal DB31, ... DBX17.6 (invert M3/M4) is not applied to the function for interpolatory tapping G331/G332.

Bit 23: "Calculation of the acceleration reduction with velocity control DRIVE"

= 0: The currently active spindle speed limit is used as the maximum speed to calculate the acceleration reduction (compatibility mode).

= 1: Only machine data MD35100 \$MA_SPIND_VELO_LIMIT, MD35130 \$MA_GEAR_STEP_MAX_VELO_LIMIT and, with position control, MD35135 \$MA_GEAR_STEP_PC_MAX_VELO_LIMIT are used for the maximum speed to calculate the acceleration reduction."

MD corresponds with:

MD20850 \$MC_SPOS_TO_VDI

MD35040 \$MA_SPIND_ACTIVE_AFTER_RESET

MD35020 \$MA_SPIND_DEFAULT_MODE

SD43200 \$SA_SPIND_S

35040	SPIND_ACTIVE_AFTER_RESET			A06, A10	S1, Z1, 2.7	
-	Own spindle RESET			BYTE	PowerOn	
CTEQ						
-	-	0	0	2	7/2	M

Description:

MD35040 \$MA_SPIND_ACTIVE_AFTER_RESET defines the response of the spindle after channel reset NC/PLC interface signal DB21-30 DBX7.7 (Reset) and program end (M2, M30).

This MD is only active in the spindle mode open-loop control mode. In positioning mode or oscillation mode, the spindle is always stopped.

MD35040 \$MA_SPIND_ACTIVE_AFTER_RESET = 0:

- Spindle stops (with M2/M30 and channel and mode group reset).
- Program is canceled.
- For spindle mode, the programmed ACC and VELOLIM are reset to 100% if MD22400 \$MC_S_VALUES_ACTIVE_AFTER_RESET and the axis-specific MD32320 \$MA_DYN_LIMIT_RESET_MASK do not specify anything else.

MD35040 \$MA_SPIND_ACTIVE_AFTER_RESET= 1:

- Spindle does not stop.
- Program is canceled.
- For spindle mode, the programmed ACC and VELOLIM are retained.

MD35040 \$MA_SPIND_ACTIVE_AFTER_RESET= 2:

- Spindle does not stop at the M function configured via MD10714 \$MN_M_NO_FCT_EOP (e.g. M32).
- However, the spindle stops at channel or mode group reset.
- For spindle mode, the programmed ACC and VELOLIM are retained.

The NC/PLC interface signal DB31, ... DBX2.2 (Delete distance-to-go/Spindle reset) is always effective, independent of MD35040 \$MA_SPIND_ACTIVE_AFTER_RESET.

Not relevant to:

- Spindle modes other than open-loop control mode.

Related to:

Description: This machine data defines the threshold speed/velocity for spindles/positioning/path axes from which the acceleration reduction is to start. The reference is the defined maximum speed/velocity. The starting point is a percentage of the maximum values.

The maximum speed for spindles is determined as the lowest value from machine data MD35100 \$MA_SPIND_VELO_LIMIT, MD35130 \$MA_GEAR_STEP_MAX_VELO_LIMIT and, with position control, MD35135 \$MA_GEAR_STEP_PC_MAX_VELO_LIMIT.

Example: MD35220 \$MA_ACCEL_REDUCTION_SPEED_POINT = 0.7, the maximum speed is 3000 rpm. Acceleration reduction starts at $v_{on} = 2100$ rpm, i.e. the maximum acceleration capacity is utilized in the speed range 0...2099.99 rpm. Reduced acceleration is used from 2100 rpm to the maximum speed.

Related to:

MD32000 \$MA_MAX_AX_VELO (maximum axis velocity)

MD35100 \$MA_SPIND_VELO_LIMIT (maximum spindle speed)

MD35130 \$MA_GEAR_STEP_MAX_VELO_LIMIT (maximum gear stage speed)

2.3 NC machine data

MD35135 \$MA_GEAR_STEP_PC_MAX_VELO_LIMIT (maximum gear stage speed with position control)

MD35230 \$MA_ACCEL_REDUCTION_FACTOR (reduced acceleration)

35230	ACCEL_REDUCTION_FACTOR			A06, A04	S1, S3, B2	
-	Reduced acceleration			DOUBLE	Reset	
CTEQ						
-	-	0.0	0.0	0.95	7/2	M

Description:

The machine data contains the factor by which the acceleration of the spindle/positioning/path axes is reduced with reference to the maximum speed/velocity. The acceleration is reduced by this factor between the threshold speed/velocity defined in MD35220 \$MA_ACCEL_REDUCTION_SPEED_POINT and the maximum speed/velocity.

Example:

$a = 10 \text{ rev/s}^2$, $v_{on} = 2100 \text{ rpm}$, MD35230 \$MA_ACCEL_REDUCTION_FACTOR = 0.3.

Acceleration and deceleration take place within the speed range 0...2099.99 rpm with an acceleration of 10 rev/s^2 . From a speed of 2100 rpm up to the maximum speed, the acceleration is reduced from 10 rev/s^2 to 7 rev/s^2 .

MD irrelevant to:

Errors that lead to rapid stop.

35500	SPIND_ON_SPEED_AT_IPO_START			A03, A06, A10	S1, Z1	
-	Feedrate enable for spindle in the set range			BYTE	Reset	
CTEQ						
-	-	1	0	2	7/2	M

Description: For SW 4.2 and higher:

2.3 NC machine data

Byte = 0:

The path interpolation is not affected

Byte = 1:

The path interpolation is not enabled (positioning axes continue traversing) until the spindle has reached the specified speed. The tolerance range can be set in MD 35150: \$MA_SPIND_DES_VELO_TOL. If a measuring system is active, the actual speed is monitored, otherwise the set speed. Path axes traversing in continuous-path mode (G64) are not stopped.

Byte = 2:

In addition to 1, traversing path axes are also stopped before machining begins, e.g. continuous-path mode (G64) and the change from rapid traverse (G0) to a machining block (G1, G2,...). The path is stopped at the last G0 block, and does not start traversing until the spindle is within the set speed range. If the spindle speed is re-programmed between two machining blocks, and the spindle speed is not yet in the setpoint range during transition from the first to the second machining block, the traversing path axes are also braked.

Restriction:

If the spindle is re-programmed by the PLC (FC18) or a synchronized action "shortly" before the end of the last G0 block, the path decelerates on the basis of the dynamic limitations. Since the spindle programming is asynchronous, a traverse can be made into the machining block if necessary. If the spindle has reached the setpoint speed range, machining starts from this position.

Byte = 3:

No longer available for SW 5.3 and higher.

Related to:

MD35150 \$MA_SPIND_DES_VELO_TOL (Spindle speed tolerance)

NC/PLC interface signal DB31, ... DBX83.5 (Spindle in setpoint range)

rev/min	Maximum speeds for tapping			DOUBLE	NEW CONF	
CTEQ						
-	6	10000., 10000., 10000., 10000., 10000., 10000.	0.1	1.0E+301	7/2	M

Description: Limit speed values for tapping without compensating chuck with G331/G332.

The maximum speed of the linear motor characteristic range (constant acceleration capacity) must be specified depending on the gear stage.

35590	PARAMSET_CHANGE_ENABLE			EXP, A05	TE3, A2, S1, Z1	
-	Parameter set can be changed			BYTE	PowerOn	
CTEQ						
-	-	0	0	2	7/2	M

Description:

0: Parameter set changes cannot be controlled.

For axes and spindles in axis mode: The first parameter set is always active. In the case of spindles the parameter set is set as appropriate for the gear stage (1st gear stage uses 2nd parameter set). Exceptions: See below.

1: The parameter set applied in the servo is defined via the VDI interface or SCPARA. Parameter sets 1 to 6 can be selected. Sets are selected using the NC/PLC interface signal DB31, ... DBX9.0 - .2 (selection of parameter set servo A, B, C) in the binary-coded value range 0 to 5. Binary values 6 and 7 select parameter set no. 6. Exceptions: See below.

For 0 and 1:

With G33, G34, G35, G331, G332, the parameter set number for the axes involved is activated in accordance with the master spindle gear stage, increased by one (corresponds with parameter set numbers 2 to 6).

For spindles, parameter sets 2 to 6 are always active, depending on the set gear stage plus one.

2: The parameter set is only ever defined via the VDI interface or SCPARA. Parameter sets 1 to 6 can be selected. Sets are selected using the NC/PLC interface signal DB31, ... DBX9.0 - .2 (selection of parameter set servo A, B, C) in the binary-coded value range 0 to 5. Binary values 6 and 7 select parameter set no. 6.

Secondary conditions:

Changeover response is determined by whether the KV factor differs between the active parameter set and the new parameter set.

Changing a parameter set where the load gearbox factors differ between the active parameter set and the new parameter set will reset the referenced signal, provided that the axis has an indirect measuring system.

The parameter set contains the following axial machine data:

MD36200 \$MA_AX_VELO_LIMIT

MD32200 \$MA_POSCTRL_GAIN

MD32800 \$MA_EQUIV_CURRCTRL_TIME

MD32810 \$MA_EQUIV_SPEEDCTRL_TIME

MD32910 \$MA_DYN_MATCH_TIME

MD31050 \$MA_DRIVE_AX_RATIO_DENOM

MD31060 \$MA_DRIVE_AX_RATIO_NUMERA

Corresponds with:

NC/PLC interface signals DB31, ... DBX9.0 - .2 (selection of parameter set servo A, B, C) and DB31, ... DBX69.0 - .2 (selected parameter set servo A, B, C)

mm, degrees	Exact stop coarse			DOUBLE	NEW CONF	
-						
-	-	0.04, 0.04, 0.04, 0.04, 0.04, 0.04, 0.04, 0.04...	0.0	1.0E+301	7/2	M

Description:

Threshold for exact stop coarse

2.3 NC machine data

An NC block is considered as terminated if the actual position of the path axes is away from the setpoint position by the value entered for the exact stop limit. If the actual position of a path axis is not within this limit, the NC block is considered as not terminated, and further part program execution is not possible. The magnitude of the value entered influences the transition to the next block. The larger the value, the earlier the block change is initiated.

If the specified exact stop limit is not reached, then

- the block is considered as not terminated,
- further traversing of the axis is not possible,
- alarm 25080 Positioning monitoring is output after expiry of the time specified in MD36020 \$MA_POSITIONING_TIME (monitoring time for exact stop fine),
- the direction of movement +/- is indicated for the axis in the positioning display. The exact stop window is also evaluated for spindles in position control mode (SPCON instruction).

Special cases:

MD36000 \$MA_STOP_LIMIT_COARSE must not be set smaller than MD36010 \$MA_STOP_LIMIT_FINE (exact stop fine). To achieve the identical block change behavior as with the "exact stop fine" criterion, the exact stop coarse window may be identical to the exact stop fine window. MD36000 \$MA_STOP_LIMIT_COARSE must not be set equal to or greater than MD36030 \$MA_STANDSTILL_POS_TOL (standstill tolerance).

Related to:

-	Special functions with clamped axis	UBYTE	NEW CONF
CTEQ			
-	-	0	0
		0x07	2/1
			M

Description: This MD defines how a blocked axis is taken into account.
 Bit 0 =0:
 If a blocked axis is to be traversed again in continuous-path mode, it must be ensured via the part program that the path axes are stopped and that there is time for releasing the blockage.
 Bit 0 =1:
 If a blocked axis is to be traversed again in continuous-path mode, the LookAhead function stops the path motion if required until the position controller is allowed to traverse the blocked axis again, i.e. until the controller enable is set again.
 Bit 1 is relevant only if bit 0 is set:
 Bit 1 =0:

If a blocked axis is to be traversed again in continuous-path mode, the LookAhead function does not release the blockage.

Bit 1 =1:

If a blocked axis is to be traversed again in continuous-path mode, a traversing command for the blocked axis is given in the preceding G0 blocks so that the PLC releases the axis blockage again.

Bit 2 =0:

If an axis is to be blocked in continuous-path mode, it must be ensured in the part program that the path axes are stopped to make sure that there is time for setting the blockage.

Bit 2 =1:

If an axis is to be blocked in continuous-path mode, the LookAhead function stops the path motion prior to or in the next non-G0 block, if the axis has not yet been blocked by that time, i.e. the PLC has not yet set the feedrate override to zero.

36060	STANDSTILL_VELO_TOL			A05, A04	TE1, A2, A3, D1, Z1	
mm/min, rev/min	Threshold velocity/speed 'Axis/spindle in stop'			DOUBLE	NEW CONF	
-						
-	-	(5.0/ 1.0), (5.0/ 1.0), (5.0/ 1.0), (5.0/ 1.0), (5.0/ 1.0), (5.0...	(0./ 0.)	(MD_DBLMAX/ MD_DBLMAX)	7/2	M

Description:

This MD defines the standstill range for the axis velocity / spindle speed. If the actual velocity of the axis or the actual speed of the spindle is less than the value entered in this MD, the NC/PLC interface signal DB31, ... DBX61.4 (Axis/spindle stationary) is set.

To bring the axis/spindle to a standstill under control, the pulse enable should not be removed until the axis/spindle is at a standstill. Otherwise it will coast down.

In order to obtain robust stationary information in the NC/PLC interface signal DB31, ... DBX61.4 (axis/spindle stationary), fluctuations in the axis velocity or the spindle speed in comparison to the average value in the software are more strongly evaluated by the ratio between MD10071 \$MN_IPO_CYCLE_TIME and MD10061 \$MN_POSCTRL_CYCLE_TIME.

For a robust threshold setting, the maximum fluctuation in axis velocity or spindle speed observed at a standstill must be multiplied by this ratio.

-	-	1.0e8	-MD_DBLMAX	1.0E+301	7/2	M

Description:

This machine data can define a 2nd software limit switch position in the positive direction in the machine axis system. The PLC can select which of the two software limit switches 1 or 2 is to be active by means of an interface signal.

For example:

DB31, ... DBX12.3 = 0 (1st software limit switch plus) active for 1st axis

DB31, ... DBX12.3 = 1 (2nd software limit switch plus) active for 1st axis

MD irrelevant:

if axis is not referenced.

Related to:

NC/PLC interface signal DB31, ... DBX12.3 (2nd software limit switch plus)

36200	AX_VELO_LIMIT			A05, A11, A04	TE3, A3, G2, S1, V1	
mm/min, rev/min	Threshold value for velocity monitoring			DOUBLE	NEW CONF	
CTEQ						
-	6	-	(0./ 0.)	(MD_DBLMAX/ MD_DBLMAX)	7/2	M

Description: The threshold value for actual velocity monitoring is entered in this machine data. If the axis has at least one active encoder and if this encoder is below its limit frequency, alarm 25030 "Actual velocity alarm limit" is triggered when the threshold value is exceeded, and the axis is stopped.

Settings:

- For axes, a value should be selected that is 10-15 % higher than that in MD32000 \$MA_MAX_AX_VELO (maximum axis velocity).

When temperature compensation is active MD32750 \$MA_TEMP_COMP_TYPE, the maximum axis velocity is increased by an additional factor, which is obtained from MD32760 \$MA_COMP_ADD_VELO_FACTOR (velocity increase as a result of compensation). Therefore, the following should apply for the threshold value of the velocity monitoring:

MD36200 \$MA_AX_VELO_LIMIT[n] > MD32000 \$MA_MAX_AX_VELO * (1,1 ... 1,15 + MD32760 \$MA_COMP_ADD_VELO_FACTOR)

- For spindles, a value should be selected for each gear stage that is 10-15 % above MD35130 \$MA_GEAR_STEP_MAX_VELO_LIMIT[n] (maximum speed of the gear stage).

The index of the machine data has the following coding: [control parameter set no.]: 0-5

36210	CTRLOUT_LIMIT			EXP, A05	A3, D1, G2	
%	Maximum speed setpoint			DOUBLE	NEW CONF	
CTEQ						
-	1	110.0	0	200	7/2	M

Description: This MD defines the maximum speed setpoint in percent. 100% is the maximum speed setpoint, this corresponds to 10 V for an analog interface or the maximum speed for PROFIdrive drives (manufacturer-specific adjustable parameter in the drive, e.g. p1082 and, if applicable, p2000 for SINAMICS).

The maximum speed setpoint depends on whether there are any setpoint limitations in the speed and current controller.

An alarm is output and the axis is stopped when the limit is exceeded.

The limit is to be selected so that the maximum velocity (rapid traverse) can be reached, and an appropriate additional control margin is available.

Note: If a value corresponding to the upper limit (200%) is entered, this value is automatically corrected by the system to 199,9999%. This correction is made for technical reasons.

36220	CTRLOUT_LIMIT_TIME			EXP, A05	A3	
s	Delay time for speed setpoint monitoring			DOUBLE	NEW CONF	
-						
-	1	0.0	0.0	1.0E+301	7/2	M

Description: This MD defines how long the speed setpoint may be within the limit CTRLOUT_LIMIT[n] (max. speed setpoint) until the monitoring function is triggered.

Monitoring (and with it also this machine data) is always active.

Reaching the limit renders the position control loop non-linear, which results in contour errors provided that the speed setpoint limited axis is participating in contour generation. That is why this MD has default value 0, i.e. the monitoring function responds as soon as the speed setpoint reaches the limit.

2.3 NC machine data

36300	ENC_FREQ_LIMIT			EXP, A02, A05, A06	A3, D1, R1, Z1	
-	Encoder limit frequency			DOUBLE	PowerOn	
-						
-	2	3.0e5, 3.0e5	0.0	1.0E+301	7/2	M

Description: This MD is used to enter the encoder frequency, which, in general, is a manufacturer specification (type plate, documentation).
For PROFIdrive:
No automatic, software-internal limitation for encoders on the PROFIdrive drive; here, the limit values of the measuring circuit module depend on the drive hardware used, i.e. known only by the drive. Therefore, it is the user who is responsible for taking into account the limit frequency of the measuring circuit module.

36302	ENC_FREQ_LIMIT_LOW			EXP, A02, A05, A06	A3, R1, S1, Z1	
%	Encoder limit frequency for new encoder synchronization.			DOUBLE	NEW CONF	
-						
-	2	99.9, 99.9	0	100	7/2	M

Description: Encoder frequency monitoring uses a hysteresis.
MD36300 \$MA_ENC_FREQ_LIMIT defines the encoder limit frequency. The encoder is deactivated when this frequency is exceeded. The encoder is re-activated when the frequency falls below that defined in MD36302 \$MA_ENC_FREQ_LIMIT_LOW.
MD36300 \$MA_ENC_FREQ_LIMIT is entered directly in Hertz, whereas MD36302 \$MA_ENC_FREQ_LIMIT_LOW is a fraction, expressed as a percentage of MD36300 \$MA_ENC_FREQ_LIMIT.
MD36302 \$MA_ENC_FREQ_LIMIT_LOW is therefore already correctly preset for most of the encoders used.
Exception: In the case of absolute encoders with an En-Dat interface, the limit frequency of the absolute track is significantly lower than the limit frequency of the incremental track. A low value in MD36302 \$MA_ENC_FREQ_LIMIT_LOW ensures that the encoder is not re-activated until it falls below the limit frequency of the absolute track, and therefore is not referenced until permitted by the absolute track. For spindles, this referencing is carried out automatically.
Example EnDat encoder EQN 1325:
Limit frequency of the electronics of the incremental track: 430 kHz
==> MD36300 \$MA_ENC_FREQ_LIMIT = 430 kHz
The limit frequency of the absolute track is approx. 2000 encoder rpm at 2048 increments/encoder revolution, i.e. the limit frequency is $2000/60 * 2048 \text{ Hz} = 68 \text{ kHz}$
==> MD36302 \$MA_ENC_FREQ_LIMIT_LOW = $68/430 = 15\%$

36310	ENC_ZERO_MONITORING			EXP, A02, A05	A3, R1	
-	Zero mark monitoring			DWORD	NEW CONF	
-						
-	2	0, 0	0	-	7/2	M

Description: This MD is used to activate zero mark monitoring.
For PROFIdrive drives (the corresponding diagnostics system variables are not currently supplied for incremental measuring systems):
For PROFIdrive, the permissible deviation must be set in the drive, *not* in the NC. Zero mark monitoring reported by the drive is mapped to the NCK according to the following rule:
0: no zero mark monitoring

100: no zero mark monitoring together with suppression of all encoder monitoring operations, i.e. not only alarm 25020 but also alarms 25000, 25010 etc. are suppressed.

>0 but less than 100: direct triggering of power ON alarm 25000 (or 25001).

>100: attenuated error message: reset alarm 25010 (25011) is output instead of power ON alarm 25000 (25001).

For absolute measuring systems (MD30240 \$MA_ENC_TYPE=4):

Permissible deviation in 1/2 coarse increments between the absolute and the incremental encoder track (one 1/2 coarse increment is sufficient).

36312	ENC_ABS_ZEROMON_WARNING			EXP, A02, A05	A3	
-	Zero mark monitoring warning level			DWORD	NEW CONF	
-						
-	2	10, 10	0	-	7/2	M

Description: Only for absolute measuring systems (MD30240 \$MA_ENC_TYPE=4):
This MD activates zero mark diagnostics.
0: no zero mark diagnostics
>0: permissible deviation in 1/2 coarse increments between the absolute and the incremental encoder track (one 1/2 coarse increment is sufficient).

36314	ENC_ABS_ZEROMON_INITIAL			EXP, A02, A05	A3	
-	Warning level for absolute encoder power ON			DWORD	NEW CONF	
-						
-	2	1000, 1000	0	-	7/2	M

Description: Only for absolute measuring systems (MD30240 \$MA_ENC_TYPE=4):
Parameterization in 1/2 coarse increments
At absolute encoder power ON (deselect parking and similar) this MD parameterizes the previously permissible position offset (comparison of the new absolute position with the information last saved in SRAM). When the warning level is exceeded, system variable \$VA_ENC_ZERO_MON_ERR_CNT is incremented in coarse increments by the value 10000.

36400	CONTOUR_TOL			A05, A11	A3, D1, G2	
mm, degrees	Tolerance band for contour monitoring			DOUBLE	NEW CONF	
-						
-	-	1.0, 1.0, 1.0, 1.0, 1.0, 1.0, 1.0, 1.0...	0.0	1.0E+301	7/2	M

Description: Tolerance band for axial contour monitoring (dynamic following error monitoring).
The permissible deviation between the real and the modelled following error is entered in this MD.
The input of the tolerance band is intended to avoid spurious tripping of the dynamic following error monitoring caused by minor speed fluctuations, which occur during normal closed-loop control operations (e.g. during first cut).
Following error modelling and thus the input of this MD depend on the position control gain MD32200 \$MA_POSCTRL_GAIN
and, in the case of precontrol or simulation, on the accuracy of the controlled system model MD32810 \$MA_EQUIV_SPEEDCTRL_TIME (equivalent time constant for precontrol of speed control loop), as well as on the accelerations and velocities used.

36500	ENC_CHANGE_TOL			A02, A05	G1, K6, K3, A3, D1, G2, Z1	
mm, degrees	Tolerance at actual position value change.			DOUBLE	NEW CONF	
-						
-	-	0.1	0.0	1.0E+301	7/2	M

2.3 NC machine data

Description:

The permissible deviation between the actual values of the two measuring systems is entered in this MD.

This difference must not be exceeded when switching over the measuring system used for closed-loop control, in order to avoid compensating processes that are too strong. Otherwise, the error message 25100 "Axis %1 Switchover of measuring system not possible" is generated and the switchover does not take place.

This MD is relevant only if MD30200 \$MA_NUM_ENCS = 2.

MD36500 also limits, in the form of a ramp, the rate of change of the backlash compensation values in MD32450 \$MA_BACKLASH. The limitation depends on the setting of the position controller cycle. The lower the value in MD36500, the longer the duration of the backlash compensation during the change of direction.

This MD is relevant only if MD30200 \$MA_NUM_ENCS =1 or 2.

36510	ENC_DIFF_TOL			A02, A05	A3, G2	
mm, degrees	Tolerance of measuring system synchronization			DOUBLE	NEW CONF	
-						
-	-	0.0	0.0	1.0E+301	7/2	M

Description:

Permissible deviation between the actual values of the two measuring systems. This difference must not be exceeded during the cyclic comparison of the two measuring systems used, as otherwise error message 25105 (measuring systems deviate) would be generated.

The corresponding monitoring function is not active

- with MD input value=0,
- if less than 2 measuring systems are active/available in the axis
- or if the axis has not been referenced (at least act. closed-loop control meas. system).

With modulo axes, it is always the absolute value of the shortest/direct position difference that is monitored.

36520	DES_VELO_LIMIT			A02, A05	-	
%	Threshold for setpoint velocity monitoring			DOUBLE	NEW CONF	
-						
-	-	125.0	0.0	1.0E+301	7/2	M

Description:

Maximum permissible setpoint velocity as a percentage of the maximum axis velocity/spindle speed.

With MD36520 \$MA_DES_VELO_LIMIT, the position setpoint is monitored for abrupt changes. If the permissible limit value is exceeded, alarm 1016 error code 550010 is output.

With axes, this machine data refers to MD32000 \$MA_MAX_AX_VELO.

With spindles, this MD refers to the lower of the speeds set in

MD35130 \$MA_GEAR_STEP_MAX_VELO_LIMIT of the current gear stage and MD35100 \$MA_SPIND_VELO_LIMIT.

36600	BRAKE_MODE_CHOICE			EXP, A05	A3, Z1	
-	Deceleration response on hardware limit switch			BYTE	PowerOn	
CTEQ						
-	-	1	0	1	7/2	M

Description:

If a rising edge of the axis-specific hardware limit switch is detected while the axis is traversing, the axis is braked immediately.

The type of braking is determined by this machine data:

Value = 0:

Controlled braking along the acceleration ramp defined by MD32300 \$MA_MAX_AX_ACCEL (axis acceleration).

Value = 1:

Rapid braking (selection of setpoint = 0) with reduction of following error.

Related to:

NC/PLC interface signal DB31, ... DBX12.1 / 12.0 (Hardware limit switch plus or minus)

36610	AX_EMERGENCY_STOP_TIME			A05	TE3, K3, A2, A3, N2, Z1	
s	Maximum time for braking ramp in case of error.			DOUBLE	NEW CONF	
-						
-	-	0.05	0.0	1.0e15	7/2	M

Description:

This MD defines the braking ramp time that an axis or spindle requires to brake from maximum velocity/speed to a standstill in the event of errors (e.g. EMERGENCY STOP). At the same lead/brake acceleration, standstill is reached correspondingly earlier from lower velocities/speeds.

Mechanically robust axes are normally stopped abruptly with speed setpoint 0; values in the lower ms range are appropriate in these cases (default setting).

However, high moving masses or limited mechanical conditions (e.g. gear load capacity) often have to be taken into account for spindles. This means that the MD has to be changed to set a longer braking ramp.

Notice:

- With interpolating axes or axis/spindle couplings, it cannot be ensured that the contour or coupling will be maintained during the braking phase.
- If the time set for the braking ramp for error states is too long, the controller enable will be removed although the axis/spindle is still moving. Depending on the drive type used and the activation of the pulse enable, either an immediate stop with speed setpoint 0 will be initiated or the axis/spindle will coast down without power. The time selected in MD36610 \$MA_AX_EMERGENCY_STOP_TIME should therefore be shorter than the time in MD36620 \$MA_SERVO_DISABLE_DELAY_TIME (cutout delay, controller enable) so that the configured braking ramp can be fully active throughout the entire braking operation.
- The braking ramp may be ineffective or not maintained if the active drive follows its own braking ramp logic (e.g. SINAMICS).

Related to:

MD36620 \$MA_SERVO_DISABLE_DELAY_TIME (cutout delay controller enable)

MD36210 \$MA_CTRLOUT_LIMIT (maximum speed setpoint)

36620	SERVO_DISABLE_DELAY_TIME			A05	TE3, K3, A2, A3, N2, Z1	
s	Cutout delay servo enable			DOUBLE	NEW CONF	
-						
-	-	0.1	0.0	1.0e15	7/2	M

Description:

Maximum time delay for removal of "controller enable" after faults. The speed enable (controller enable) of the drive is removed internally within the controller after the set delay time, at the latest.

The delay time entered becomes active as a result of the following events:

- Errors that lead to immediate stopping of the axes
- Removal of the interface signal DB31, ... DBX2.1 (Controller enable) from the PLC

As soon as the actual speed reaches the standstill range (MD36060 \$MA_STANDSTILL_VELO_TOL), the "controller enable" for the drive is removed. The time set should be long enough to enable the axis / spindle to brake down to a standstill from maximum traversing velocity or maximum speed. If the axis / spindle is stationary, the "controller enable" for the drive is removed immediately (i.e. the time defined in MD36620 \$MA_SERVO_DISABLE_DELAY_TIME is terminated prematurely).

Application example(s):

Speed control of the drive should be retained long enough to enable the axis / spindle to brake down to standstill from maximum traversing velocity or maximum speed.

2.3 NC machine data

Notice:

If the cutout delay controller enable is set too short, controller enable will be removed although the axis/spindle is still moving. This axis/spindle then coasts down without power (which may be appropriate for grinding wheels, for example); otherwise the time set in MD36620 \$MA_SERVO_DISABLE_DELAY_TIME should be longer than the duration of the braking ramp for error states (MD36610 \$MA_AX_EMERGENCY_STOP_TIME).

Related to:

NC/PLC interface signal DB31, ... DBX2.1 (Controller enable)

MD36610 \$MA_AX_EMERGENCY_STOP_TIME

For SINAMICS drives: Drive parameter P1082 (maximum speed / velocity)

36700	DRIFT_ENABLE			EXP, A07, A09	G2	
-	Automatic drift compensation			BOOLEAN	NEW CONF	
-						
-	-	FALSE	0	-	1/1	M

Description:

Only for special analog and hydraulic drives (not active with PROFIdrive drives):

Automatic drift compensation is activated with MD36700 \$MA_DRIFT_ENABLE.

1: Automatic drift compensation active (only for position-controlled axes/spindles).

With automatic drift compensation, while the axis is at a standstill, the control continually calculates the additional drift value still required to ensure that the following error reaches the value 0 (compensation criterion). The total drift value is, therefore, formed from the drift basic value (MD36720 \$MA_DRIFT_VALUE) and the drift additional value.

0: Automatic drift compensation not active.

The drift value is formed only from the drift basic value (MD36720 \$MA_DRIFT_VALUE).

Not relevant for:

Non-position-controlled spindles

Related to:

MD36710 \$MA_DRIFT_LIMIT drift limit value for automatic drift compensation

MD36720 \$MA_DRIFT_VALUE drift basic value

36710	DRIFT_LIMIT			EXP, A07, A09	-	
%	Drift limit value for automatic drift compensation			DOUBLE	NEW CONF	
-						
-	1	0.0	0	1.e9	1/1	M

Description:

Only for special analog and hydraulic drives (not active with PROFIdrive drives):

The magnitude of the drift additional value calculated during automatic drift compensation can be limited with MD36710 \$MA_DRIFT_LIMIT.

If the drift additional value exceeds the limit value entered in MD36710 \$MA_DRIFT_LIMIT, alarm 25070 "Drift value too large" is output and the drift additional value is limited to this value.

Not relevant for:

MD36700 \$MA_DRIFT_ENABLE = 0

36720	DRIFT_VALUE			EXP, A07, A09	-	
%	Basic drift value			DOUBLE	NEW CONF	
-						
-	1	0.0	-1e15	1e15	1/1	M

Description:

Only for special analog and hydraulic drives (not active with PROFIdrive drives):

The value entered in MD36720 \$MA_DRIFT_VALUE is always added as an offset to the manipulated variable. Whereas automatic drift compensation is active only for position-controlled axes, this machine data is always active.

Special case: the following applies to PROFIdrive drives:

This MD can also be used for "simple" drives that have drift problems due to drive-internal implementation as analog drives. To avoid erroneous settings, this static drift compensation only becomes active with PROFIdrive if MD32250 \$MA_RATED_OUTVAL != 0 (i.e. the MD has no effect in the case of automatic interface adjustment between the NC and the drive).

Note:

Drift compensation must not be active if the DSC function (MD32640 \$MA_STIFFNESS_CONTROL_ENABLE=1) is being used, otherwise unexpected speed oscillations will occur when DSC is enabled/disabled.

Standardization: The input value is related to the corresponding interface standardization in

MD32250 \$MA_RATED_OUTVAL,
MD32260 \$MA_RATED_VELO, and
MD36210 \$MA_CTRLOUT_LIMIT.

36730	DRIVE_SIGNAL_TRACKING			A10	B3	
-	Acquisition of additional drive actual values			BYTE	PowerOn	
-						
-	-	0	0	4	7/2	M

Description: MD36730 \$MA_DRIVE_SIGNAL_TRACKING = 1 activates the acquisition of the following drive actual values (if they are made available by the drive):

- \$AA_LOAD Drive load
- \$AA_POWER Drive active power
- \$AA_TORQUE Drive torque setpoint
- \$AA_CURR Smoothed current setpoint (q-axis current) of drive

MD36730 \$MA_DRIVE_SIGNAL_TRACKING = 2 activates the acquisition of the following drive actual values:

With PROFIdrive, it must be ensured that the stated values are also transmitted in the drive actual message frame (provide sufficient message frame length on the bus, assign the values to the message frame content in the drive, e.g. use message frame 116).

- \$VA_DP_ACT_TEL shows actual value message frame words

Note: Values 3 and 4 are reserved

Note: The value range of MD36730 \$MA_DRIVE_SIGNAL_TRACKING can be restricted because of reduced functions of control systems

36750	AA_OFF_MODE			A10	2.4, 5.3, 6.2	
-	Effect of value assignment for axial override of synchr. action.			UBYTE	PowerOn	
CTEQ

Description: Mode setting for axial offset \$AA_OFF

Bit 0: Effect of value assignment within a synchronized action

- 0: Absolute value
- 1: Incremental value (integrator)

Bit 1: Response of \$AA_OFF on RESET

- 0: \$AA_OFF is deselected on RESET
- 1: \$AA_OFF is retained beyond RESET

Bit 2: \$AA_OFF in JOG mode

- 0: No superimposed motion due to \$AA_OFF

2.3 NC machine data

1: A superimposed motion due to \$AA_OFF is interpolated
 Bit 3: \$AA_OFF motion remains active on NC stop
 0: Motion is interrupted on NC stop
 1: Motion remains active on NC stop

36901	SAFE_FUNCTION_ENABLE			A05	FBSI	
-	Enable safety functions			UDWORD	PowerOn	
-						
-	-	0	0	0x81FFFB	7/2	M

Description:

The safe operation functions can be enabled for an axis/spindle with this data.

For each axis, only as many axes/spindles can be enabled for safe operation as are enabled by the global option.

The more subfunctions are set, the more CPU time the safety functions need.

Bit 0: Enables safe velocity, safe operational stop

Bit 1: Enables safe limit switches

Bit 2: Reserved for functions with absolute references (such as SE/SN)

Bit 3: Enables actual value synchronization, 2-encoder system

Bit 4: Enables external ESR activation (STOP E)

Bit 5: Enables SG offset

Bit 6: Enables external stop requests

Bit 7: Enables cam synchronization

Bit 8: Enables safe cams, pair 1, cam +

Bit 9: Enables safe cams, pair 1, cam -

Bit 10: Enables safe cams, pair 2, cam +

Bit 11: Enables safe cams, pair 2, cam -

Bit 12: Enables safe cams, pair 3, cam +

Bit 13: Enables safe cams, pair 3, cam -

Bit 14: Enables safe cams, pair 4, cam +

Bit 15: Enables safe cams, pair 4, cam -

Bit 16: Enables synchronization "n < nx", hysteresis and filtering

Bit 23: Enables deactivation of SBH/SG monitoring during external stop A

Special cases:

- When one of the bits from bit 1 is set, bit 0 also has to be set because the control switches to safe operational stop with STOP C, D, E (parameterization alarm 27033 is displayed if there is an error).
- If the global option does not enable enough axes/spindles for safe operation, then this data can be overwritten with the value 0 during runup.

Related to: Global option

36902	SAFE_IS_ROT_AX			A01, A06	FBSI	
-	Rotary axis			BOOLEAN	PowerOn	
-						
-	-	FALSE	-	-	7/2	M

Description:

States whether the axis for safe operation is a rotary axis/spindle or a linear axis.

0: Linear axis

1: Rotary axis/spindle

The value in this MD must be equal to that in MD30300 \$MA_IS_ROT_AX. A parameterization error is displayed if there is a difference.

36903	SAFE_CAM_ENABLE			A05	-	
-	Function enable safe cam track			UDWORD	PowerOn	
-						
-	-	0	0	0x3FFFFFFF	7/2	M

Description: With this data, 30 safe cams can be enabled for the "safe cam track" function for an axis/spindle.

The enables must only be set if the cam enable in MD36901 \$MA_SAFE_FUNCTION_ENABLE is not used.

If the "safe cam track" function is enabled, cam synchronization is automatically activated with it.

Bit 0: Enables safe cam track, cam 1

Bit 1: Enables safe cam track, cam 2

Bit 2: Enables safe cam track, cam 3

Bit 3: Enables safe cam track, cam 4

Bit 4: Enables safe cam track, cam 5

Bit 5: Enables safe cam track, cam 6

Bit 6: Enables safe cam track, cam 7

Bit 7: Enables safe cam track, cam 8

Bit 8: Enables safe cam track, cam 9

Bit 9: Enables safe cam track, cam 10

MD36901: \$MA_SAFE_FUNCTION_ENABLE

36904	SAFE_ADD_FUNCTION_MASK			A05	FBSI	
-	Enable additional functions for Safety Integrated			UDWORD	PowerOn	
-						
-	-	0	0	0x1	7/2	M

Description: Bit 0: On the NCK side, braking is with stops B and C and not by the default "Speed setpoint 0". The braking on the drive side is based on the OFF3 ramp.

2.3 NC machine data

36905	SAFE_MODULO_RANGE			A01, A06	FBSI	
degrees	Modulo value Safe cams			DOUBLE	PowerOn	
-						
-	-	0.0	0.0	737280.0	7/2	M

Description:

Actual value range in which the safe cams are calculated for rotary axes. The axis must be a rotary axis (MD36902 \$MA_SAFE_IS_ROT_AX = 1).

0: Modulo compensation after +/- 2048 revolutions (that is after 737,280 degrees)

>0 And multiples of 360 degrees: Modulo compensation after this value, for example: value = 360 --> then the actual value range lies between 0 and 359.999 degrees. That is modulo compensation is made after each revolution.

Special cases:

- If the value of this data is not 0 or a multiple of 360 degrees then a corresponding alarm is issued during power on.
- The parameterized actual value ranges of the cam positions are also checked during power on. A corresponding alarm is issued if there is a parameterization error.
- The actual value ranges set by MD36905 \$MA_SAFE_MODULO_RANGE and MD30330 \$MA_MODULO_RANGE must be integers and divisible without a remainder.

Related to:

MD30330: \$MA_MODULO_RANGE

-	SI drive assignment			BYTE	PowerOn	
-						
-	-	1, 2, 3, 4, 5, 6, 7, 8...	1	31	7/2	M

Description:

Assignment of the drive for SI motion monitoring.

The entry refers to data field MD10393 \$MN_SAFE_DRIVE_LOGIC_ADDRESS.

The drive assigned must be the same as the one selected using MD30110 \$MA_CTRLOUT_MODULE_NR and MD13050 \$MN_DRIVE_LOGIC_ADDRESS.

36907	SAFE_DRIVE_PS_ADDRESS			A01	-	
-	PROFIsafe address of the drive			UDWORD	PowerOn	
-						
-	-	0	0x0	0x7FFFFFFF	ReadOnly	S

Description:

This NCK MD contains the PROFIsafe address of the drive assigned to this axis. This MD is read from drive parameter r9810 during power on. This address must be unique across all axes.

This MD cannot be written, the PROFIsafe address must be parameterized in the drive.

The value of this MD is included in the calculation of MD36998 \$MA_SAFE_ACT_CHECKSUM[2].

36909	SAFE_ENC_MEAS_STEPS_RESOL			A02	FBSI	
mm	Resolving measurement steps for linear absolute encoders			DOUBLE	PowerOn	
-						
-	-	0.0001	0.0	4295	ReadOnly	S

Description:

Sets the resolution of the absolute position for a linear absolute encoder.

When powering up, this information for linear DRIVE-CLiQ encoders is read from drive parameter r0469 and is compared with the value last saved. This MD is then overwritten. If not equal, then alarm 27036 is output.

The value of this MD is incorporated in the checksum calculation of MD36998
\$MA_SAFE_ACT_CHECKSUM[0].

Corresponds with:

MD36913: \$MA_SAFE_ENC_MEAS_STEPS_POS1

MD36917: \$MA_SAFE_ENC_GRID_POINT_DIST

36912	SAFE_ENC_INPUT_NR			A01, A02	FBSI	
-	Actual value assignment			BYTE	PowerOn	
-						
-	-	1	1	3	7/2	M

Description: Number of the actual value input through which the safe actual values are recorded.

Related to:

p9526, p0189

-	Non-safety-relevant measurement steps POS1			DWORD	PowerOn	
-						
-	-	22000	0	-	ReadOnly	S

Description: Sets the non safety-relevant measurement steps of the position value POS1.

When powering up, this information for linear DRIVE-CLiQ encoders is read out of drive parameter r0473 and compared with the value last saved here. This MD is then overwritten. If not equal, then alarm 27036 is output.

The value of this MD is incorporated in the checksum calculation of MD36998

\$MA_SAFE_ACT_CHECKSUM[0].

Corresponds with:

MD36909: \$MA_SAFE_ENC_MEAS_STEPS_RESOL

MD36917: \$MA_SAFE_ENC_GRID_POINT_DIST

36914	SAFE_SINGLE_ENC			A01, A02	-	
-	SI single-encoder system			BOOLEAN	PowerOn	
-						
-	-	TRUE	-	-	7/2	M

Description: Identifier that SI is carried out with an encoder. This MD must be parameterized to 0 if different encoders are used for the Safety Integrated monitoring functions in the NCK and in the drive.

36916	SAFE_ENC_IS_LINEAR			A02	FBSI	
-	Linear encoder			BOOLEAN	PowerOn	
-						
-	-	FALSE	-	-	7/2	M

Description: Defines whether a linear or a rotary encoder is connected.

0: Rotary encoder is connected, its resolution is defined in MD36918

\$MA_SAFE_ENC_RESOL, and converted with MD36920 \$MA_SAFE_ENC_GEAR_PITCH, MD36921 \$MA_SAFE_ENC_GEAR_DENOM[n], and MD36922 \$MA_SAFE_ENC_GEAR_NUMERA[n] on the load side. MD36917 \$MA_SAFE_ENC_GRID_POINT_DIST has no meaning.

1: Linear encoder is connected, its resolution is defined in MD36917

\$MA_SAFE_ENC_GRID_POINT_DIST. MD36918 \$MA_SAFE_ENC_RESOL, MD36920 \$MA_SAFE_ENC_GEAR_PITCH, MD36921 \$MA_SAFE_ENC_GEAR_DENOM[n], and MD36922 \$MA_SAFE_ENC_GEAR_NUMERA[n] have no meaning. If the value changes, alarm 27036 is triggered.

```

36917	SAFE_ENC_GRID_POINT_DIST			A02	FBSI	
mm	Scale division for linear scale			DOUBLE	PowerOn	
-						
-	-	0.01	0.00001	250	7/2	M

Description: Definition of the grid spacing of the linear scale used.
Not relevant for a rotary encoder.
Alarm 27036 is triggered if the value changes.

36918	SAFE_ENC_RESOL			A02	FBSI	
-	Encoder lines per revolution			DWORD	PowerOn	
-						
-	-	2048	1	100000000	7/2	M

Description: Definition of the lines per revolution for a rotary encoder.
Not relevant for a linear encoder.
Alarm 27036 is triggered if the value changes.

36919	SAFE_ENC_PULSE_SHIFT			A02	-	
-	Shift factor of encoder multiplication			BYTE	PowerOn	
-						
-	-	11	2	18	ReadOnly	S

Description: Slide factor of the multiplication factor (high-resolution) of the encoder used for the Safety Integrated monitoring functions in the NCK. The encoder value must be divided by 2, the number of times needed to get the number of encoder lines. A slide factor of 11 corresponds to an encoder multiplication factor of 2048. If the drive provides this information (r0979[3,13,23]), this MD is automatically assigned internally after power ON of the drive. If the value changes during this process, alarm 27036 is triggered.

36920	SAFE_ENC_GEAR_PITCH			A02	FBSI	
mm	Leadscrew pitch			DOUBLE	PowerOn	
-						
-	-	10.0	0.1	10000.	7/2	M

Description: Gear ratio between encoder and load for a linear axis with a rotary encoder.

36923	SAFE_INFO_ENC_RESOL			A02, A08	-	
mm, degrees	Safe encoder resolution			DOUBLE	PowerOn	
-						
-	8	0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0	-	-	ReadOnly	S

Description: Display data:
Resolution of the encoder used in the relevant gear stage for the Safety Integrated monitoring functions. A single encoder system can monitor safe positions with this accuracy. This MD is 0 if different encoders are used in the drive and in the NCK for the Safety Integrated monitoring functions.

36924	SAFE_ENC_NUM_BITS			A02	-	
-	Bit information of the redundant actual value			DWORD	PowerOn	
-						
-	4	16,2,16,16	-16	32	ReadOnly	S

Description: Information about the redundant actual value:

- Array index 0: Number of valid bits of the redundant actual value
- Array index 1: Number of fine resolution bits of the redundant actual value
- Array index 2: Number of relevant bits of the redundant actual value
- Array index 3: Most significant bit of the redundant coarse position

This information is read out when powering up (for DRIVE-CLiQ encoders from drive parameters p0470, p0471, p0472, and p0475; the default values apply for SMI/SMC/SME encoders) and compared with the most recent values saved here. This MD is then overwritten. In the case of inequality, alarm 27035 or 27036 is output. The values from MD36924 \$MA_SAFE_ENC_NUM_BITS[0,1] are included in the calculation of MD36998 \$MA_SAFE_ACT_CHECKSUM[1]. The values from MD36924 \$MA_SAFE_ENC_NUM_BITS[2,3] are included in the calculation of MD36998 \$MA_SAFE_ACT_CHECKSUM[0].

If the combination of several values is incorrect or the number of relevant bits (index 2) is equal to 0, then alarm 27038 is output.

36925	SAFE_ENC_POLARITY			A02	FBSI	
-	Direction reversal of actual value			DWORD	PowerOn	
-						
-	-	1	-1	1	7/2	M

Description: A direction reversal of the actual value can be set with this data.

-1: Direction reversal
0: No direction reversal or
1: No direction reversal

2.3 NC machine data

36926	SAFE_ENC_IS_GEAR_REVERSAL			A02	FBSI	
-	Direction reversal of gear			BOOLEAN	PowerOn	
-						
-	8	FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE	-	-	7/2	M

Description: Setting the direction reversal for the gear.
 0 (FALSE): No direction reversal
 1 (TRUE): Direction reversal
 n = 0, 1, ... 7 stand for gear stages 1, 2, ... 8
 The current value is selected via safety-related input signals (SGE).

36927	SAFE_ENC_MOD_TYPE			A02	-	
-	Encoder evaluation type			BYTE	PowerOn	
-						
-	-	1	-	-	ReadOnly	S

Description: Type of encoder evaluation used for Safety Integrated on this axis.
 1 = Sensor Module (SMI, SMC, SME)
 2 = DRIVE-CLiQ encoder
 3 = EnDatV2.2 converter
 This type is read out from drive parameter r9527 when powering up. If a valid value has not been entered, alarm 27038 is output. If the drive parameter contains a valid value, this is compared with the last value stored in this MD. This MD is then overwritten. In the event of inequality, alarm 27035 is output. The value of this MD is included in the calculation of MD36998 \$MA_SAFE_ACT_CHECKSUM[1].

36928	SAFE_ENC_IDENT			A02	-	
-	Encoder identification			UDWORD	PowerOn	
-						
-	3	0, 0, 0	0x0	0xFFFFFFFF	ReadOnly	S

Description: Identification of the encoder evaluation used for Safety Integrated on this axis. This identification is read out during power-on by the encoder evaluation (drive parameter r9881), and compared with the last value stored here. This MD is then overwritten. The value of this MD is included in the calculation of MD36998 \$MA_SAFE_ACT_CHECKSUM[1].
 Related to:
 r9881: SI Motion Sensor Module Node Identifier second channel

36929	SAFE_ENC_CONF			A02	-	
-	Configuration of the redundant actual value			UDWORD	PowerOn	
-						
-	-	0	0x0	0x7FFFFFFF	ReadOnly	S

Description: Configuration of the redundant actual value for DRIVE-CLiQ encoders:
 Bit 0: Up-down counter
 = 0: Down counter
 = 1: Up counter
 Bit 1: Encoder CRC: Processing of redundant coarse position
 = 0: Most significant byte first
 = 1: Least significant byte first
 Bit 2: Redundant coarse position MSB-/LSB-justified

= 0: Redundant coarse position LSB-justified

= 1: Redundant coarse position MSB-justified

Bit 4: Binary comparison not possible

= 0: Binary comparison possible

= 1: Binary comparison not possible

This information is read out from drive parameter r0474 during ramp-up for DRIVE-CLiQ encoders, and compared with the last value stored here (the default values apply to SMI/SMC/SME encoders). This MD is then overwritten. In the event of inequality, alarm 27035 is output. The value of this MD is included in the calculation of MD36998 \$MA_SAFE_ACT_CHECKSUM[1].

If an unknown bit is set in drive parameter r0474, alarm 27038 is output. The alarm output at this location can be suppressed using MD10096 \$MN_SAFE_DIAGNOSIS_MASK, bit 3 = 1.

36930	SAFE_STANDSTILL_TOL			A05	FBSI	
mm, degrees	Standstill tolerance			DOUBLE	PowerOn	
-						
-	-	1.	0.	100.	7/2	M

Description: Definition of the tolerance for safe operational stop.

The control triggers alarm 27010 with STOP B if the difference between position limit value and actual position value is greater than this tolerance when safe operational stop is selected. The position limit value is the actual position value at the time safe operational stop was selected.

Related to:

MD36956: \$MA_SAFE_PULSE_DISABLE_DELAY

36931	SAFE_VELO_LIMIT			A05, A04	FBSI	
mm/min, rev/min	Limit value for safe velocity			DOUBLE	PowerOn	
-						
-	4	2000., 2000., 2000., 2000.	0.0	1.0E+301	7/2	M

Description: Definition of the limit values for the safe velocities 1, 2, 3 and 4.

If SG1, SG2, SG3 or SG4 is selected and the current velocity exceeds this limit value, the control triggers alarm 27011 with the stop response configured in MD36961 \$MA_SAFE_VELO_STOP_MODE or MD36963 \$MA_SAFE_VELO_STOP_REACTION.

n = 0, 1, 2, 3 stand for the limit values of SG1, SG2, SG3, SG4

Special cases:

- In a 1-encoder system with SBH/SG active, the velocity is monitored according to the encoder frequency limit. A corresponding alarm is output if this is exceeded.

Related to:

MD36961: \$MA_SAFE_VELO_STOP_MODE

MD36963: \$MA_SAFE_VELO_STOP_REACTION

36933	SAFE_DES_VELO_LIMIT			A05, A04	FBSI	
%	SG setpoint speed limit			DOUBLE	Reset	
-						
-	4	0.0,0.0,0.0,0.0	0	100	7/2	M

Description:

Weighting factors for determining the setpoint velocity limit.

The active weighting factor is selected via the axis-specific NC/PLC interface DB31, ... DBX34.0 - .1 .

Parameterization:

To set this MD optimally, it may be necessary to make a number of changes to take the dynamic performance of the drives into account.

Effect of SI monitoring with NCK involvement:

- When 0% is entered, the setpoint velocity limit is inactive.
- When 100% is entered, the setpoint is limited to the active SG stage.
- The active actual velocity limit is weighted with the selected factor, and specified to the interpolator as the setpoint limit.
- If SBH is selected, setpoint 0 is specified.
- This data is not included in the cross-check with the drive.
- This data is not included in the axis-specific checksum MD36998 \$MA_SAFE_ACT_CHECKSUM[], as it involves a 1-channel function.

Effect of drive-autonomous SI monitoring:

- The precondition is that the connection has been activated in the NCK via SIC (MD37950 \$MA_SAFE_INFO_ENABLE, bit 0).
- When 0% is entered, the NCK influence on the setpoint limit is inactive. The setpoint limit corresponds to the value read from the drive via SIC.
- When values > 0% are entered, the NCK influence on the setpoint velocity limit is active. It affects the setpoint limit read from the drive via SIC.
- The value read from the drive via SIC is weighted with the selected factor, and specified to the interpolator as the setpoint limit.
- The parameterizable setpoint limit in the drive (p9533) is active independently of the NCK limit.

Special cases:

- If the PLC user program does not contain any settings for selecting the weighting factor, the MD value from MD36933 \$MA_SAFE_DES_VELO_LIMIT[0] applies.

36934	SAFE_POS_LIMIT_PLUS			A03, A05	FBSI	
mm, degrees	Upper limit of safe end position			DOUBLE	PowerOn	
-						
-	2	100000., 100000.	-2147000	2147000	7/2	M

Description:

Definition of the upper limit value for safe end positions 1 and 2.

If SE1 or SE2 is selected and the current actual position is greater than this limit value, the control triggers alarm 27012 with the stop response configured in MD36962 \$MA_SAFE_POS_STOP_MODE and switches to SBH. Stop responses STOP B and A follow if SBH is violated.

n = 0, 1 stand for the upper limit values of SE1, SE2

Description:

Definition of the minus cam position for the safe cams SN1 -, SN2 -, SN3 -, ...

The following applies to the function "Safe cams":

If, with activated safe cams (MD36901 \$MA_SAFE_FUNCTION_ENABLE), the actual position is greater than this value, the corresponding safety-related output signal (SGA) is set to 1. If the actual position falls below this value, the SGA is set to 0.

n = 0, 1, 2, 3 stand for minus cam positions of SN1 -, SN2 -, SN3 -, SN4 -

The following applies to the function "Safe cam track":

If the function "Safe cam track" has been enabled (MD36903 \$MA_SAFE_CAM_ENABLE), the safety-related output signals "Cam track" and "Cam range" are set in accordance with the parameterization in MD36938 \$MA_SAFE_CAM_TRACK_ASSIGN[n].

n = 0 ... 29 stand for minus cam positions of SN1-, SN2-, ..., SN30-.

Related to:

MD36936: \$MA_SAFE_CAM_POS_PLUS[n]

MD36938: \$MA_SAFE_CAM_TRACK_ASSIGN[n]

MD36989: \$MA_SAFE_CAM_MINUS_OUTPUT[n]

MD37900: \$MA_SAFE_CAM_TRACK_OUTPUT[n]

MD37901/37902/37903/37904: \$MA_SAFE_CAM_RANGE_OUTPUT_1/2/3/4[n]

MD37906/37907/37908/37909: \$MA_SAFE_CAM_RANGE_BIN_OUTPUT_1/2/3/4[n]

36938	SAFE_CAM_TRACK_ASSIGN			A01, A05	FBSI	
-	Cam track assignment			DWORD	PowerOn	
-						
-	30	100, 101, 102, 103, 104, 105, 106, 107, 108, 109, 110, 111, 112,	100	414	7/2	M

Description:

Assignment of the individual cams to the max. 4 cam tracks including definition of the numerical value for SGA "Cam range".

>The hundreds digit defines to which cam track the cam is assigned. Valid values are 1, 2, 3 or 4.

The tens and ones digits include the numerical value that is to be reported to the safe logics as SGA "Cam range" and processed there. Valid values are 0 to 14, while each numerical value per cam track may be used only once.

Therefore the valid value range of this machine data is:

100...114, 200...214, 300...314, 400...414

Examples:

MD36938 \$MA_SAFE_CAM_TRACK_ASSIGN[0] = 207: cam 1 (index 0) is assigned to cam track 2.

If the position is within the range of this cam, a 7 is entered in SGA "Cam range" of the 2nd cam track.

MD36938 \$MA_SAFE_CAM_TRACK_ASSIGN[5] = 100: cam 6 (index 5) is assigned to cam track 1.

If the position is within the range of this cam, a 0 is entered in SGA "Cam range" of the 1st cam track.

36940	SAFE_CAM_TOL			A05	FBSI	
mm, degrees	Tolerance for safe cams			DOUBLE	PowerOn	
-						
-	-	0.1	0.001	10	7/2	M

Description: As a result of differing encoder mounting positions and differing cycle and run times, the cam signals of the two monitoring channels never switch at exactly the same position or at exactly the same time.

This data defines the tolerance as a load-side path for all cams, within which the monitoring channels can have different signal states for the same cam without triggering alarm 27001.

Recommendation:

Enter a value equal to or slightly larger than that in MD36942 \$MA_SAFE_POS_TOL.

36942	SAFE_POS_TOL			A05	FBSI	
mm, degrees	Tolerance actual value cross-check			DOUBLE	PowerOn	
-						
-	-	(0.1/0.1)	(0.001/0.001)	(10/360)	7/2	M

Description: Because of varying installation locations for the encoder, backlash, torsion, leadscrew error etc, the two actual positions acquired simultaneously by NCK and drive may differ from one another.

The tolerance for the cross-check of the actual positions in the two monitoring channels is entered in this data.

Special cases:

- The prime consideration for defining this tolerance are the values from the machine-specific risk analysis.
- If this tolerance is exceeded, stop reaction STOP F ensues.

36944	SAFE_REFP_POS_TOL			A05	FBSI	
mm, degrees	Tolerance actual value check (referencing)			DOUBLE	PowerOn	
-						
-	-	(0.01/0.01)	(0/0)	(1/36)	7/2	M

Description: This data defines the tolerance for checking the actual values after referencing (for an incremental encoder) or during power-on (for an absolute encoder).

Referencing determines an absolute actual position of the axis. A second absolute actual position is derived from the last stored standstill position before the control was switched off and the path traversed since power-on. The control checks the actual values after referencing with these two absolute positions, the path traversed and this data.

The following influences must be taken into account when determining the tolerance values:

2.3 NC machine data

backlash, leadscrew error, compensations (max. compensation values with LEC, sag and temperature compensation), temperature errors, torsion (2-encoder system), gear tolerance in variable gears, coarser resolution (2-encoder system), oscillation distance with variable gears.

Note:

If the two absolute actual positions differ by more than the value in this data when the user enable is given, alarm 27001 is displayed with error code 1003, and a new user enable is required for referencing.

36945	SAFE_VELO_X_FILTER_TIME			A04, A05	FBSI	
s	Filter n < nx			DOUBLE	PowerOn	
-						
-	-	0	0	0.5	7/2	M

Description: Setting the filter time to form the SGA "n < nx"
 The filtering must be activated by setting bit 16 in MD36901 \$MA_SAFE_FUNCTION_ENABLE.
 Filtering is not active with default value 0.
 Parameterizing a filter time not equal to 0 increases the reaction time of SGA "n < nx".
 Related to:
 MD36946: \$MA_SAFE_VELO_X
 MD36947: \$MA_SAFE_VELO_X_HYSTERESIS

36946	SAFE_VELO_X			A04, A05	FBSI	
mm/min, rev/min	Velocity limit n < nx			DOUBLE	PowerOn	
-						
-	-	(20./ 20)	(0./0.)	(1000./1000.)	7/2	M

Description: This data defines the limit velocity n_x for the SGA "n < nx".
 SGA "n < nx" is set if this velocity limit is undershot.
 If this machine data has the value 0, the function "n < nx" is not active.
 Note:
 To evaluate SGA "n < nx", an I/O assignment must be made in MD36985
 \$MA_SAFE_VELO_X_STATUS_OUTPUT.

36947	SAFE_VELO_X_HYSTERESIS			A04, A05	FBSI	
mm/min, rev/min	Velocity hysteresis n < nx			DOUBLE	PowerOn	
-						
-	-	(10./10)	(0./0.)	(500./500.)	7/2	M

Description: Setting of the hysteresis threshold to form the SGA "n < nx".
 This MD is used in addition to the hysteresis to check the velocity in both monitoring channels at the threshold nx. The velocity must not differ more than the value of this MD, otherwise a Stop F will be output with error code 2.
 MD36947 \$MA_SAFE_VELO_X_HYSTERESIS must be less than or equal to 3/4 MD36946 \$MA_SAFE_VELO_X.
 The function "Synchronization "n < nx", hysteresis and filtering" must be active (MD36901 \$MA_SAFE_FUNCTION_ENABLE, bit 16 = 1).
 Related to:
 MD36945: \$MA_SAFE_VELO_X_FILTER_TIME
 MD36946: \$MA_SAFE_VELO_X

36948	SAFE_STOP_VELO_TOL			A04, A05	FBSI	
mm/min, rev/min	Velocity tolerance for Safe monitoring of acceleration			DOUBLE	PowerOn	
-						
-	-	(300./ 50.)	(0./ 0.)	(120000./ 20000.)	7/2	M

Description: Tolerance of the actual velocity for safe monitoring of the acceleration (SBR).
This tolerance is added to the actual velocity after safe monitoring of the acceleration has been activated (by triggering a Stop B or C).
The actual velocity must not be greater than the limit thus defined.
Otherwise a Stop A is triggered. This reveals an acceleration of the drive as quickly as possible.

36949	SAFE_SLIP_VELO_TOL			A04, A05	FBSI	
mm/min, rev/min	Slip velocity tolerance			DOUBLE	PowerOn	
-						
-	-	(6./ 1.)	(0./ 0.)	(1000./ 1000.)	7/2	M

Description: Difference in velocity between the motor and load sides that is tolerated in a 2-encoder system, without the data cross-check between drive and NCK signaling an error.
MD36949 \$MA_SAFE_SLIP_VELO_TOL is only evaluated if MD36901 \$MA_SAFE_FUNCTION_ENABLE, bit3 is set.

36950	SAFE_MODE_SWITCH_TIME			A05	FBSI	
s	Tolerance time for SGE switchover			DOUBLE	PowerOn	
-						
-	-	0.5	0	10.	7/2	M

Description: SGE switchovers are not active simultaneously because the data transfer runtimes of the SGEs differ in the two monitoring channels. The data cross-check would report an error in this case.
This data defines the length of time after SGE switchovers during which the actual values and the monitoring results are not cross-checked (the machine data continue to be compared!). The selected monitoring continues to run uninterrupted in both monitoring channels.
A safe function becomes active in a monitoring channel as soon as the selection or switchover is detected in this channel.
The differing runtime is mainly determined by the PLC cycle time.
System-related minimum tolerance time: 2 x PLC cycle time (maximum cycle) + 1 x IPO cycle time.
The runtime differences must also be taken into account in the external circuit (e.g. relay switching times).

36951	SAFE_VELO_SWITCH_DELAY			A05	FBSI	
s	Delay time for velocity changeover			DOUBLE	PowerOn	
-						
-	-	0.1	0	600.	7/2	M

Description: A timer with this value is started on transition from a higher to a lower safe velocity or on selection of the safe operating stop when safe velocity is active.
The parameterized value selected must be as low as possible.
The last selected velocity limit value continues to be monitored while the timer is running. During this time, the axis/spindle can be decelerated, for example via the PLC user program, without the monitoring reporting an error and triggering a stop response.
Special cases:

2.3 NC machine data

- The timer is canceled immediately on switching to a limit greater than or equal to the previously active SG limit.
- The timer is canceled immediately on switching to "Non-safe operation" (SGE "Deselect SBH/SG=1").
- The timer is retrigged (restarted) on switching to a limit less than the previously active SG limit or to SBH while the timer is running.

36952	SAFE_STOP_SWITCH_TIME_C			A05	FBSI	
s	Transition time STOP C to safe standstill			DOUBLE	PowerOn	
-						
-	-	0.1	0	600.	7/2	M

Description: This data defines the time after which a switch is made to safe operational stop when a STOP C has been triggered.

The parameterized value selected must be as low as possible.

Safe operational stop is monitored after this time has expired. STOP A or B is triggered if the axis/spindle could not be stopped.

36953	SAFE_STOP_SWITCH_TIME_D			A05	FBSI	
s	Transition time STOP D to safe standstill			DOUBLE	PowerOn	
-						
-	-	0.1	0	600.	7/2	M

Description: This data defines the time after which a switch is made to safe operational stop when a STOP D has been triggered.

The parameterized value selected must be as low as possible.

Safe operational stop is monitored after this time has expired. STOP B is triggered if the axis/spindle could not be stopped.

36954	SAFE_STOP_SWITCH_TIME_E			A05	FBSI	
s	Transitional period STOP E to safe standstill			DOUBLE	PowerOn	
-						
-	-	0.1	0	600.	7/2	M

Description: Time period is specified in this data after which switchover to safe operating stop is performed if a STOP E is triggered.

The parameterized value selected must be as small as possible.

After the time has elapsed, monitoring for safe operating stop is performed. If the axis/spindle has still not been stopped, STOP B is triggered.

36955	SAFE_STOP_SWITCH_TIME_F			A05	FBSI	
s	Transition time STOP F to STOP B			DOUBLE	PowerOn	
-						
-	-	0.0	0	600.	7/2	M

Description: Time period after which a switch over takes place from stop F to stop B with active monitoring functions.

The parameterized value selected must be as low as possible.

During this time, another deceleration reaction can be activated, e.g. by means of synchronized actions.

The switch over also takes place if a C/D/E stop occurs during this time.

36956	SAFE_PULSE_DISABLE_DELAY			A05	FBSI	
s	Delay time for pulse suppression			DOUBLE	PowerOn	
-						
-	-	0.1	0	600.	7/2	M

Description: On STOP B, deceleration is made with "speed setpoint 0" (or OFF3 ramp) , and changed to STOP A for pulse suppression after the delay time defined with this data.
The parameterized value selected must be as low as possible.

Special cases:

- The pulse suppression is performed earlier than defined in this data if the condition for pulse suppression is present via MD36960 \$MA_SAFE_STANDSTILL_VELO_TOL or via MD36620 \$MA_SERVO_DISABLE_DELAY_TIME.
- If the time is set in this data to ZERO, then on STOP B an immediate change is made to STOP A (immediate pulse suppression).

Relating to:
MD36960: \$MA_SAFE_STANDSTILL_VELO_TOL
MD36620: \$MA_SERVO_DISABLE_DELAY_TIME
MD36060: \$MA_STANDSTILL_VELO_TOL

36957	SAFE_PULSE_DIS_CHECK_TIME			A05	FBSI	
s	Time for checking pulse suppression			DOUBLE	PowerOn	
-						
-	-	0.1	0	10	7/2	M

Description: Definition of the time after which pulses have to be disabled after a request to disable pulses.
The time between resetting SGA "Enable pulse" and detecting the disabling of pulses via SGE "Status pulses disabled" must not exceed the value of this data.
Note:
STOP A is triggered if this time is exceeded.

36958	SAFE_ACCEPTANCE_TST_TIMEOUT			A05	FBSI	
s	Time limit for acceptance test duration			DOUBLE	PowerOn	
-						
-	-	40.0	5	100	7/2	M

Description: On the NCK side, a time limit can be specified for the duration of an acceptance test.
The NCK terminates the test if an acceptance test takes longer than the time defined in this MD.
The acceptance test status is set to zero on the NCK side. When the acceptance test status is reset, SI power-on alarms are reset again from reset-acknowledgeable to power-on-acknowledgeable on the NCK and drive sides.
The NCK clears alarm 27007 and the drive clears message C01799 .
This MD is also used to limit the duration of an SE (safe limit position) acceptance test. After the programmed time has elapsed, the SE acceptance test is canceled and alarm 27008 cleared. The software limit positions then again act as defined in the machine data.

36960	SAFE_STANDSTILL_VELO_TOL			A05, A04	FBSI	
mm/min, rev/min	Creep speed for pulse suppression			DOUBLE	PowerOn	
-						
-	-	(0./ 0.)	(0./ 0.)	(1000./ 1000.)	7/2	M

Description: Speed below which the axle/spindle is regarded as being at a standstill and the pulses are disabled with STOP B (through transition to STOP A).

2.3 NC machine data

Related to:

MD36956: \$MA_SAFE_PULSE_DISABLE_DELAY

36961	SAFE_VELO_STOP_MODE			A05	FBSI	
-	Stop reaction for safe velocity			BYTE	PowerOn	
-						
-	-	5	0	14	7/2	M

Description:

The stop reaction defined in this data is triggered if the limit value for the safe velocity 1, 2, 3 or 4

is exceeded.

= 0, 1, 2, 3 correspond to STOP A, B, C, D, common to each safe velocity stage

= 5 means that the stop reaction can be configured specifically for each safe velocity in MD36963 \$MA_SAFE_VELO_STOP_REACTION.

The units digit defines the selection of the stop reaction when the safe velocity is exceeded.

The tens digit defines the behavior in the case of failure of communication to the drive if a time greater than 0 is parameterized in MD10089

\$MN_SAFE_PULSE_DIS_TIME_BUSFAIL.

0: Stop A

1: Stop B

2: Stop C

3: Stop D

4: Stop E

5: MD36961 \$MA_SAFE_VELO_STOP_MODE invalid, stop reaction is parameterized via MD36963 \$MA_SAFE_VELO_STOP_REACTION

10: Stop A, additionally, in the event of failure of communication to the drive, pulses are not disabled immediately if safe velocity is active

11: Stop B, additionally, in the event of failure of communication to the drive, pulses are not disabled immediately if safe velocity is active

12: Stop C, additionally, in the event of failure of communication to the drive, pulses are not disabled immediately if safe velocity is active

13: Stop D, additionally, in the event of failure of communication to the drive, pulses are not disabled immediately if safe velocity is active

14: Stop E, additionally, in the event of failure of communication to the drive, pulses are not disabled immediately if safe velocity is active

Special cases:

- If the value in this MD is 5, the stop reaction for each safe velocity stage is defined selectively in MD36963 \$MA_SAFE_VELO_STOP_REACTION.

Related to:

MD36931: \$MA_SAFE_VELO_LIMIT[n]

-	Stop reaction for safe velocity			BYTE	PowerOn	
-						
-	4	2, 2, 2, 2	0	14	7/2	M

Description:

The stop response defined in this data is triggered if the limit value for the safe velocity 1, 2, 3 or 4 is exceeded.

n = 0, 1, 2, 3 stand for SG1, SG2, SG3, SG4

The units digit defines the selection of the stop response for each specific safe velocity when the safe velocity is exceeded.

The tens digit defines the behavior in the case of a failure of communication to the drive for each specific safe velocity if a time greater than 0 has been parameterized in MD10089 \$MN_SAFE_PULSE_DIS_TIME_BUSFAIL.

Value Meaning

0: Stop A

1: Stop B

2: Stop C

3: Stop D

4: Stop E

10: Stop A, additionally, in the event of failure of communication to the drive, pulses are not disabled immediately if this safe velocity level is active

11: Stop B, additionally, in the event of failure of communication to the drive, pulses are not disabled immediately if this safe velocity level is active

12: Stop C, additionally, in the event of failure of communication to the drive, pulses are not disabled immediately if this safe velocity level is active

13: Stop D, additionally, in the event of failure of communication to the drive, pulses are not disabled immediately if this safe velocity level is active

14: Stop E, additionally, in the event of failure of communication to the drive, pulses are not disabled immediately if this safe velocity level is active

Note:

This MD is only active when MD36961 \$MA_SAFE_VELO_STOP_MODE and drive parameter p9561 have the value 5.

Related to:

MD10089: \$MN_SAFE_PULSE_DIS_TIME_BUSFAIL

MD36961: \$MA_SAFE_VELO_STOP_MODE

36964	SAFE_IPO_STOP_GROUP			A01, A05	FBSI	
-	Safety-integrated IPO-response grouping			BYTE	Reset	
-						
-	-	0	0	1	7/2	M

Description:

This MD is only active with Safety Integrated axes and spindles.

It influences the channel-wide IPO response distribution of Safety Integrated:

0 = Default: All other axes/spindles in the channel are informed of the IPO stop response of this axis.

1 = For internal stops, the axes and machining spindles interpolating with the axis in question are also influenced via the triggered safety alarms.

2.3 NC machine data

Other axes/spindles in the channel, however, continue without disturbance. In the case of external stops (without an alarm) all other axes/spindles are not influenced by the safety axis/spindle stop. This allows, for example, the safe cancelation of the pulses of a spindle (using external Stop A) so that the spindle can be turned manually but still move the axes safely with monitoring.

If the other axes/spindles stop together with the safety axis/spindle in certain machining situations, the user must implement this at his own responsibility using the PLC or synchronous action operations.

36965	SAFE_PARK_ALARM_SUPPRESS			A01	FBSI	
-	Alarm suppression on parking axis			BOOLEAN	PowerOn	
-						
-	-	FALSE	-	-	7/2	M

Description: This MD is only active for Safety Integrated axes/spindles.
 0 = Default setting: Alarms 27000/A01797 are displayed when parking is selected.
 1 = Alarms 27000/A01797 are not displayed when parking is selected. This is necessary for axes that are disconnected on the encoder side during the machining process (e.g. dressing axes). The alarms are displayed when parking is deselected again.

36966	SAFE_BRAKETEST_TORQUE			A05	FBSI	
%	Holding torque for brake test (NC-controlled)			DOUBLE	PowerOn	
CTEQ						
-	-	5.0	0.0	800.0	7/2	M

Description: Definition of the torque and force for the NC-controlled functional test of the brake mechanism.
 This torque and force is exerted on the applied brake during the test without the axis being allowed to move.
 The percentage value entered here is related to drive parameter p2003 of the axis.
 The following supplementary conditions apply:
 If the current torque is more than 85% of the test torque when the brake test is selected (that is, with the brake off), the brake test is canceled with alarm 20095. This ensures that the motor can stop the axis even if the brake is defective.
 If the brake test is performed with the drive parameter p1532 (MD36968 \$MA_SAFE_BRAKETEST_CONTROL bit0 = 0), the safety margin required is increased by double the difference between the current holding torque and the value in parameter p1532.
 Release of the corresponding test function via MD37000 \$MA_FIXED_STOP_MODE bit 1.
 Related to:
 MD36969: \$MA_SAFE_BRAKETEST_TORQUE_NORM

36967	SAFE_BRAKETEST_POS_TOL			A05	FBSI	
mm, degrees	Position tolerance for brake test (NC-controlled)			DOUBLE	PowerOn	
CTEQ						
-	-	1.0	0.0	1.0E+301	7/2	M

Description: Maximum position tolerance for the functional test of the brake mechanics.
 The functional test of the brake mechanics is canceled if the axis position deviates by more than this tolerance from the position at selection of the brake test.
 The corresponding test function is enabled by MD37000 \$MA_FIXED_STOP_MODE, bit 1.
 MD37000 \$MA_FIXED_STOP_MODE bit 1.

36968	SAFE_BRAKETEST_CONTROL			A05	-	
-	Advanced settings for the brake test			UDWORD	PowerOn	
CTEQ						
-	-	0	0	0x7	7/2	M

Description: Advanced settings for the NC-controlled and SINAMICS brake test.

Bit 0: Selection of the average value for the torque limit

= 0: Drive parameter p1532 is used as the average value of the torque limit

= 1: The torque measured at the time of selection of the brake test is used as the average value of the torque limit

Bit 1: Criterion for reaching the torque limit in the PLC

= 0: The torque limit must be reached during the programmed traversing distance

= 1: The torque limit must be reached during the programmed time (PLC)

Bit 2: Selection of the positioning behavior at the end of the SINAMICS brake test

= 0: Positioning at the current axis position

= 1: Positioning at the last programmed axis position

36969	SAFE_BRAKETEST_TORQUE_NORM			A05	FBSI	
kgm²	Reference variable for brake test holding torque			DOUBLE	PowerOn	
CTEQ						
-	-	0.0	-	-	ReadOnly	S

Description: Setting of the reference variable for torques

All torques indicated as relative value refer to this reference variable.

This MD is an image of drive parameter p2003

36970	SAFE_SVSS_DISABLE_INPUT			A01	FBSI	
-	Input assignment SBH/SG deselection			UDWORD	PowerOn	
-						
-	-	0	0x00000000	0x8403073F	7/2	M

Description: This data defines the NC input for selecting/deselecting the functions SBH and SG.

Signal	Meaning
= 0	SG or SBH is selected
= 1	SG and SBH are deselected

Structure (general):

The machine data for assignment of the safe inputs are structured as follows:

\$MA_SAFE..._INPUT = is mm xx nnH

Bit position	Permissible values	Meaning
i 31...28	= 0	Do not invert signal before processing
	= 8	Invert signal before processing
s 27...24	= 4	Assignment to SPL interface
mm 23...16	= 1	Addressing of the internal SPL interface \$A_OUTSI
	= 2	Addressing of the external SPL interface \$A_INSE
xx 15...8	= 1...6	Number of the system variable word
nn 7...0	= 1...20H	Bit number in the system variable word

Special cases:

- Entry of 0 means there is no existing assignment, the input remains fixed at 0, SG and SBH cannot be deselected.
- Entry of 80 00 00 00 means there is no existing assignment, the input remains fixed at 1.
- Multiple input signals can be parameterized to the same system variable.

2.3 NC machine data

36971	SAFE_SS_DISABLE_INPUT			A01	FBSI	
-	Input assignment SBH deselection			UDWORD	PowerOn	
-						
-	-	0	0x00000000	0x8403073F	7/2	M

Description:

Assignment of the NC input for deselecting the function safe operational stop.

Structure: See MD36970 \$MA_SAFE_SVSS_DISABLE_INPUT

Input assignment to the safe functions if either safe velocity or safe operational stop have been activated.

Signal Meaning

= 0 Safe operational stop is selected

= 1 Safe operational stop is deselected (only if other functions have not triggered a STOP C, D or E)

Special cases:

- This input is irrelevant if SG and SBH have been deselected (see MD36970 \$MA_SAFE_SVSS_DISABLE_INPUT).

36972	SAFE_VELO_SELECT_INPUT			A01	FBSI	
-	Input assignment SG selection			UDWORD	PowerOn	
-						
-	2	0, 0	0x00000000	0x8403073F	7/2	M

Description:

This data defines the two inputs for selecting SG1, SG2, SG3 or SG4.

Structure: See MD36970 \$MA_SAFE_SVSS_DISABLE_INPUT

n = 1, 0 stand for bit 1, 0 for selecting SG1 to SG4

Assignment of the input bits to the safe velocities:

Bit 1	Bit 0	Selected SG
0	0	SG1
0	1	SG2
1	0	SG3
1	1	SG4

36973	SAFE_POS_SELECT_INPUT			A01	FBSI	
-	Input assignment SE selection			UDWORD	PowerOn	
-						
-	-	0	0x00000000	0x8403073F	7/2	M

Description:

This data defines the input for selecting safe limit positions 1 or 2.

Structure see: MD36970 \$MA_SAFE_SVSS_DISABLE_INPUT

Signal Meaning

= 0 SE1 is active

= 1 SE2 is active

36974	SAFE_GEAR_SELECT_INPUT			A01	FBSI	
-	Input assignment speed ratio selection			UDWORD	PowerOn	
-						
-	3	0, 0, 0	0x00000000	0x8403073F	7/2	M

Description:

Input assignment for selecting the gear ratio (gear stage).

Structure: See MD36970 \$MA_SAFE_SVSS_DISABLE_INPUT

n = 2, 1, 0 stand for bit 2, 1, 0 for selecting gear stages 1 to 8

Bit 2	Bit 1	Bit 0	Active gear stage
-------	-------	-------	-------------------

0	0	0	Stage 1
0	0	1	Stage 2
0	1	0	Stage 3
...	...	...	...
1	1	1	Stage 8

36977	SAFE_EXT_STOP_INPUT			A01	FBSI	
-	Input assignment for external stop request			UDWORD	PowerOn	
-						
-	4	0, 0, 0, 0	0x00000000	0x8403073F	7/2	M

Description: This data defines the NC inputs for selecting/deselecting the external brake requests.
 n = 0, 1, 2, 3 stand for the various braking modes
 n = 0: Assignment for "Deselect external stop A" (SH, disabling of pulses)
 n = 1: Assignment for "Deselect external stop C" (braking at the current limit/OFF3 ramp)
 n = 2: Assignment for "Deselect external stop D" (path braking)
 n = 3: Assignment for "Deselect external stop E" (ESR + path braking)
 Structure: See MD36970 \$MA_SAFE_SVSS_DISABLE_INPUT
 Special cases:

- The signal "Deselect external stop A" cannot be parameterized inverted. A parameter error is reported if there is an error.

36978	SAFE_OVR_INPUT			A01	FBSI	
-	Input assignment for SG override			UDWORD	PowerOn	
-						
-	4	0, 0, 0, 0	0x00000000	0x8403073F	7/2	M

Description: Assignment of the NC inputs for the override of the limit values of safe velocities 2 and 4.
 Structure: See MD36970 \$MA_SAFE_SVSS_DISABLE_INPUT
 n = 3, 2, 1, 0 stand for the override selection bits 3, 2, 1, 0
 Assignment of the input bits to the SG override values:

Bit 3	Bit 2	Bit 1	Bit 0	
0	0	0	0	Override 0 is selected
0	0	0	1	Override 1 is selected
to ...				
1	1	1	1	Override 15 is selected

The following machine data defines the override factor itself (percentage value):
 MD36932: \$MA_SAFE_VELO_OVR_FACTOR[n]
 Note:
 The function "Override safe velocity" is enabled in MD36901 \$MA_SAFE_FUNCTION_ENABLE, bit 5.
 Related to:
 MD36932: \$MA_SAFE_VELO_OVR_FACTOR[n]

36980	SAFE_SVSS_STATUS_OUTPUT			A01	FBSI	
-	Output assignment SBH/SG active			UDWORD	PowerOn	
-						
-	-	0	0x00000000	0x8403073F	7/2	M

Description: Assignment of the output for reporting the status of the functions safe velocity and safe operating stop.

2.3 NC machine data

Signal Meaning
 = 0 SG and SBH are not active
 = 1 SG or SBH is active

Structure (general):

The machine data for assignment of the safe outputs have the following structure:

\$MA_SAFE_..._OUTPUT = is mm xx nnH

	Bit position	Permissible values	Meaning
i	31...28	= 0 = 8	Do not invert signal before output Invert signal before output
s	27...24	= 4	Assignment to SPL interface
mm	23...16	= 1	Addressing of the internal SPL interface \$A_INSI
xx	15...0	= 1...6	Number of the system variable word
nn	7...0	= 1...20H	Bit number in the system variable word

Special cases:

- Entry of 0 means
There is no existing assignment, the output is not affected.
- Entry of 80 00 00 00 means there is no existing assignment, the output remains fixed at 1.
- If a single output signal is placed on a system variable, then:
If MD bit 31 is set, the signal is processed inverted.
- If multiple output signals are placed on the same system variable, then:
If MD bit 31 is set, the signal in question is first inverted. The (possibly inverted) output signals are then ANDed. The result is written to the system variable.

36981	SAFE_SS_STATUS_OUTPUT			A01	FBSI	
-	Output assignment SBH active			UDWORD	PowerOn	
-						
-	-	0	0x00000000	0x8403073F	7/2	M

Description: This data defines the output or the system variable for the message "SBH active".

Structure see: MD36980 \$MA_SAFE_SVSS_STATUS_OUTPUT

Signal Meaning
 = 0 SBH is inactive
 = 1 SBH is active

36982	SAFE_VELO_STATUS_OUTPUT			A01	FBSI	
-	Output assignment for active SG selection			UDWORD	PowerOn	
-						
-	2	0, 0	0x00000000	0x8403073F	7/2	M

Description: This data defines the outputs or the system variables for the messages "SBH active bit 0" and "SBH active bit 1".

Structure see: MD36980 \$MA_SAFE_SVSS_STATUS_OUTPUT

n = 1, 0 stand for SG active bits 1, 0

Bit 1 Bit 0 Meaning:

= 0	= 0	SG1 active if SBH/SG are active and SBH is not active
		SBH active if SBH/SG are active and SBH is active
= 1	= 0	SG2 active
= 0	= 1	SG3 active
= 1	= 1	SG4 active

36985	SAFE_VELO_X_STATUS_OUTPUT			A01	FBSI	
-	Output assignment n < n_x			UDWORD	PowerOn	
-						
-	-	0	0x00000000	0x8403073F	7/2	M

Description: This data defines the output or the system variable for the message "n < nx".
Structure see: MD36980 \$MA_SAFE_SVSS_STATUS_OUTPUT
Signal Meaning
= 0 Actual speed is greater than the limit speed in MD36946 \$MA_SAFE_VELO_X
= 1 Actual speed is less than or equal to the limit speed in \$MA_SAFE_VELO_X
Related to:
MD36946 \$MA_SAFE_VELO_X

36987	SAFE_REFP_STATUS_OUTPUT			A01	FBSI	
-	Output assignment axis safely referenced			UDWORD	PowerOn	
-						
-	-	0	0x00000000	0x8403073F	7/2	M

Description: This data defines the output for the message "Axis safely referenced".
Structure see: MD36980 \$MA_SAFE_SVSS_STATUS_OUTPUT
Signal Meaning
= 0 Axis is not safely referenced (that is the safe limit monitoring is inactive!)
= 1 Axis is safely referenced

36988	SAFE_CAM_PLUS_OUTPUT			A01	FBSI	
-	Output assignment SN1 + to SN4 +			UDWORD	PowerOn	
-						
-	4	0, 0, 0, 0	0x00000000	0x8403073F	7/2	M

Description: This data defines the outputs for the cam signals SN1 + to SN4 +.
Structure: See MD36980 \$MA_SAFE_SVSS_STATUS_OUTPUT
n = 0, 1, 2, 3 correspond to the assignments for plus cams SN1 +, SN2 +, SN3 +, SN4 +
Signal Meaning
= 0 Axis is left of the cam (actual value < cam position)
= 1 Axis is right of the cam (actual value > cam position)
Special cases:

- If a cam is inverted and assigned to an output with another cam, the two cams are ANDed, resulting in a single cam signal for range detection.

36989	SAFE_CAM_MINUS_OUTPUT			A01	FBSI	
-	Output assignment SN1 - to SN4 -			UDWORD	PowerOn	
-						
-	4	0, 0, 0, 0	0x00000000	0x8403073F	7/2	M

Description: This data defines the outputs for the minus cams SN1 - to SN4 -.
Structure see: MD36980 \$MA_SAFE_SVSS_STATUS_OUTPUT
n = 0, 1, 2, 3 correspond to the assignments for minus cams SN1 -, SN2 -, SN3 -, SN4 -
Signal Meaning
= 0 Axis is left of the cam (actual value < cam position)
= 1 Axis is right of the cam (actual value > cam position)
Special cases:

2.3 NC machine data

- If a cam is negated and placed with another cam on an output, it is AND-ed and a single cam signal is generated for range recognition.

36990	SAFE_ACT_STOP_OUTPUT			A01	FBSI	
-	Output assignment of active stop			UDWORD	PowerOn	
-						
-	4	0, 0, 0, 0	0x00000000	0x8403073F	7/2	M

Description: Assignment of the output signals for displaying the currently active stop.

Structure: see MD36980 \$MA_SAFE_SVSS_STATUS_OUTPUT

Index 0: Assignment for "Stop A/B active"

Index 1: Assignment for "Stop C active"

Index 2: Assignment for "Stop D active"

Index 3: Assignment for "Stop E active"

36992	SAFE_CROSSCHECK_CYCLE			A01, A08	FBSI	
s	Display of axis-specific cross-check cycle			DOUBLE	PowerOn	
-						
-	-	0.0	-	-	ReadOnly	S

Description: Display data:

Effective axis-specific cross-check cycle in seconds.

The cycle derives from MD10091 \$MN_INFO_SAFETY_CYCLE_TIME and the number of data to be cross-checked.

36993	SAFE_CONFIG_CHANGE_DATE			A08	FBSI	
-	Date/time of last change of SI axis MD			STRING	PowerOn	
-						
-	7	, , , , , , ,	-	-	ReadOnly	S

Description: Display data:

Date and time of the last configuration change to safety related NCK axis machine data.

Changes to the machine data included in the calculation of axis-specific checksums MD36998 \$MA_SAFE_ACT_CHECKSUM[] are recorded.

36995	SAFE_STANDSTILL_POS			EXP, A08	FBSI	
-	Standstill position			DWORD	PowerOn	
-						
-	-	0	-	-	ReadOnly	S

Description: This MD displays the current standstill position.

In order to be able to test the referencing of the axis for plausibility at the next control Power ON, the current position of the axis is stored in non-volatile memory in the following cases:

- On selection of safe operational stop (SBH)
- Cyclically, if SE/SN are activated

Special cases:

- If the MD is changed manually, this will be detected at the next Power ON and plausibility test. Another user agreement is required after referencing.

36997	SAFE_ACKN			A08	FBSI	
-	User acknowledge			UDWORD	PowerOn	
-						
-	-	0	0x0	0xFFFFFFFF	7/2	M

Description:

This data displays the status of the user agreement.

The user agreement can be given or withdrawn by the user by means of a corresponding screen.

If the software detects internally that the reference to the machine has been lost, then it is "automatically" withdrawn (e.g. on changing gear or if the plausibility comparison with the stored standstill position fails during referencing).

Special cases:

- If the MD is changed manually, then this will be detected at the next Power ON and plausibility test. Another user agreement is required after referencing.

36998	SAFE_ACT_CHECKSUM			A01, A08	FBSI	
-	Actual checksum			UDWORD	PowerOn	
-						
-	3	0, 0, 0	0x00000000	0xFFFFFFFF	ReadOnly	S

Description:

The actual checksum calculated across the current values of the safety-related machine data after PowerOn or on RESET is entered here.

Assignment of the field indices:

Index 0: Axis-specific monitoring functions

Index 1: Hardware component recognition

Index 2: Drive assignment

36999	SAFE_DES_CHECKSUM			A01, A08	FBSI	
-	Desired (expected) checksum			UDWORD	PowerOn	
-						
-	3	0, 0, 0	0x00000000	0xFFFFFFFF	7/1	M

Description:

This data contains the set checksum calculated across the current values of the safety-related machine data and stored at the last machine acceptance.

Assignment of the field indices:

Index 0: Axis-specific monitoring functions

Index 1: Hardware component recognition

Index 2: Drive assignment

37000	FIXED_STOP_MODE			A10	-	
-	Travel to fixed stop mode			UBYTE	PowerOn	
CTEQ						
-	-	0x0	0x0	0x3	7/2	M

Description:

Activation of subfunctions of "Travel to fixed stop".

Bit 0: Reserved

Bit 1: Enable the Safe brake test (NC-controlled)

= 0: Safe brake test not available

= 1: Safe brake test can be executed under the control of the PLC

Note: The user must ensure that Travel to fixed stop and Safe brake test are not assigned simultaneously.

2.3 NC machine data

37002	FIXED_STOP_CONTROL			A10	F1	
-	Sequence control for travel to fixed stop			UBYTE	PowerOn	
-						
-	-	0x0	0x0	0x3	7/2	M

Description: Sequence control for travel to fixed stop.

Bit 0: behavior on pulse disable at fixed stop

= 0: travel to fixed stop is canceled

= 1: travel to fixed stop is interrupted, i.e. the drive is without power.

As soon as the pulse disable is canceled again, the drive continues with the limited torque.

Control of the torque injection see bit 1.

Bit 1: behavior after pulse disable at the fixed stop

= 0: the torque is applied in steps.

= 1: the torque is applied in ramps (see MD37012 \$MA_FIXED_STOP_TORQUE_RAMP_TIME)

37010	FIXED_STOP_TORQUE_DEF			A10	-	
%	Default fixed stop clamping torque			DOUBLE	PowerOn	
CTEQ						
-	-	5.0	0.0	100.0	7/2	M

Description: The clamping torque is set in this machine data as a % of the maximum motor torque (in the case of FDD this corresponds to the % of the max. current setpoint).

The clamping torque becomes active as soon as the fixed stop is reached or the NC/PLC interface signal DB31, ... DBX1.1 (Acknowledge fixed stop reached) has been set.

The entered value is a default and is active only as long as

- no clamping torque has been programmed with command FXST[x]
- the clamping torque set in SD 43510: FIXED_STOP_TORQUE was not changed after fixed stop had been reached.

In the case of "Travel to fixed stop" with an analog drive (611-A) and fixed clamping torque, the torque limit set in the drive should be the same as the limit entered in MD37070 \$MA_FIXED_STOP_ANA_TORQUE.

Related to:

MD37070 \$MA_FIXED_STOP_ANA_TORQUE

SD 43510: FIXED_STOP_TORQUE

37012	FIXED_STOP_TORQUE_RAMP_TIME			A10	-	
s	Time period until reaching the changed torque limit			DOUBLE	NEW CONF	
-						
-	-	0.0	0.0	1.0E+301	7/2	M

Description: Period in seconds until the changed torque limit is reached.

The value 0.0 deactivates the ramp function.

37014	FIXED_STOP_TORQUE_FACTOR			A10	TE3	
-	Adaption factor torque limit			DOUBLE	NEW CONF	
-						
-	-	1.0	0.0	1.0E+301	7/2	M

Description: Interface factor torque limit.

With this factor, the torque limit of linked slave axes (MD 37250) can be weighted additionally.

Even with different motors, the torque limits can be kept equal in all linked axes.

37020	FIXED_STOP_WINDOW_DEF			A05, A10	-	
mm, degrees	Default fixed-stop monitoring window			DOUBLE	PowerOn	
CTEQ						
-	-	1.0	0.0	1.0e15	7/2	M

Description: This machine data is used to enter the default for the standstill monitoring window at fixed stop.

Fixed stop monitoring becomes active as soon as the fixed stop is reached, i.e. NC/PLC interface signal DB31, ... DBX62.5 (Fixed stop reached) is set.

If the position at which the fixed stop is detected is left by more than the tolerance specified in MD37020 \$MA_FIXED_STOP_WINDOW_DEF alarm 20093 "Fixed stop monitoring has responded" is output and the "FXS" function is deselected.

The value entered is a default setting and is active only as long as

- no fixed stop monitoring window is programmed with command FXSW[x],
- the fixed stop monitoring window is not changed via SD 43520: FIXED_STOP_WINDOW (after reaching of fixed stop).

Related to:

SD43520 \$SA_FIXED_STOP_WINDOW (fixed stop monitoring window)

37030	FIXED_STOP_THRESHOLD			A10	-	
mm, degrees	Threshold for fixed stop detection			DOUBLE	NEW CONF	
-						
-	-	2.0	0.0	1.0e15	7/2	M

Description: Threshold value for fixed stop detection.

The contour deviation is checked for this threshold as a criterion for reaching the fixed stop. Waiting until the set torque limit is reached is a further condition for digital drives.

This machine data is only active if MD37040 \$MA_FIXED_STOP_BY_SENSOR = 0.

The NC/PLC interface signal DB31, ... DBX62.5 (Fixed stop reached) is set if the axial contour deviation exceeds the threshold value set in MD37030 \$MA_FIXED_STOP_THRESHOLD.

MD irrelevant to:

MD37040 \$MA_FIXED_STOP_BY_SENSOR = 1

Related to:

NC/PLC interface signal DB31, ... DBX62.5 (Fixed stop reached)

37040	FIXED_STOP_BY_SENSOR			A10	-	
-	Fixed stop detection by sensor			BYTE	Immediately	
CTEQ						
-	-	0	0	3	7/2	M

Description: This machine data defines how the criterion "Fixed stop reached" is determined.

A change of this machine data becomes active with the next selection of travel to fixed stop.

MD=0

The criterion "Fixed stop reached" is determined internally on the basis of the axial FIXED_STOP_THRESHOLD.

MD=1

The criterion "Fixed stop reached" is determined via an external sensor and signalled to the NC via the NC/PLC interface signal DB31, ... DBX1.2 (Sensor fixed stop).

MD=2

The criterion "Fixed stop reached" is accepted if either the contour monitoring (MD = 0) or the signal of the external sensor (MD = 1) has responded.

2.3 NC machine data

MD=3

Triggering through movement analysis (only as an alternative to triggering via sensor)

Related to:

MD37030 \$MA_FIXED_STOP_THRESHOLD

(threshold for fixed stop detection)

NC/PLC interface signal DB31, ... DBX1.2 (Sensor fixed stop)

37050	FIXED_STOP_ALARM_MASK			A05, A10	-	
-	Enable of the fixed stop alarms			BYTE	NEW CONF	
-						
-	-	1	0	31	7/2	M

Description:

This machine data defines whether the alarms

20091 "Fixed stop not reached",

20094 "Fixed stop canceled" and

25042 "FOC: Standstill monitoring" are output.

MD= 0

Suppression of alarm 20091 "Fixed stop not reached"

MD= 2

Suppression of alarms

20091 "Fixed stop not reached" and

20094 "Fixed stop canceled" (SW 4 and higher)

MD=3

Suppression of alarm 20094 "Fixed stop canceled" (SW 4 and higher)

Add value 8

Suppression of alarm 25042 "FOC: Standstill monitoring" (SW 7 and higher)

Add value 16

Trigger alarm 20095 only if the brake test torque is less than the holding torque

Errors occurring during travel to fixed stop can be read out from the status variable \$AA_FXS irrespective of the setting of the alarm screen.

Standard: 1 = Alarms 20091, 20094 and 25042 are triggered

37052	FIXED_STOP_ALARM_REACTION			A05, A10	-	
-	Reaction with fixed stop alarms			UBYTE	PowerOn	
-						
-	-	0	0	-	7/1	M

Description:

Behavior of VDI signal "Mode group ready" in case of fixed stop alarms:

Bit value = 0: "Mode group ready" will be deleted (drives de-energized)

Bit value = 1: "Mode group ready" remains active

Bit0: Alarm 20090 Travel to fixed stop not possible

Bit1: Alarm 20091 Fixed stop not reached

Bit2: Alarm 20092 Travel to fixed stop still active

Bit3: Alarm 20093 Standstill monitoring at fixed stop has triggered

Bit4: Alarm 20094 Travel to fixed stop canceled

All other bits without meaning.

Standard: 0 = All alarms de-energize the drives

37060	FIXED_STOP_ACKN_MASK			A10	-	
-	Waiting for PLC acknowledgments during travel to fixed stop			UBYTE	PowerOn	
CTEQ						
-	-	0x0	0x0	0x3	7/2	M

Description:

This machine data defines whether or not the NC waits for acknowledgment messages from the PLC when the "Travel to fixed stop" function is active.

Bit 0 = 0

Once the NC has transmitted the interface signal DB31, ... DBX62.4 (Activate travel to fixed stop) to the PLC, it starts the programmed traversing.

Bit 0 = 1

After the NC has transmitted the interface signal DB31, ... DBX62.4 (Activate travel to fixed stop) to the PLC, it waits for the PLC to acknowledge with the interface signal DB31, ... DBX3.1 (Enable travel to fixed stop) and then starts the programmed traversing.

Bit 0 = 1 should be set for analog drives so that the motion is not started before the PLC has limited the torque in the drive.

Bit 1 = 0

Once the NC has transmitted the interface signal DB31, ... DBX62.5 (Fixed stop reached) to the PLC, the program advances to the next block.

Bit 1 = 1

After the NC has transmitted the interface signal DB31, ... DBX62.5 (Fixed stop reached) to the PLC, it waits for the PLC to acknowledge with the interface signal DB31, ... DBX1.1 (Acknowledge fixed stop reached), outputs the programmed torque and then advances to the next block.

Bit 1 should be set for analog drives so that the PLC can switch the drive to torque-controlled operation if a programmable clamping torque has to be specified.

With digital drives (PROFIdrive), the "Travel to fixed stop" function can be executed without any acknowledgments, thus allowing program run times to be reduced.

Related to:

NC/PLC interface signal DB31, ... DBX62.4 (Activate travel to fixed stop)

NC/PLC interface signal DB31, ... DBX3.1 (Enable travel to fixed stop)

NC/PLC interface signal DB31, ... DBX62.5 (Fixed stop reached)

NC/PLC interface signal DB31, ... DBX1.1 (Acknowledge fixed stop reached)

37070	FIXED_STOP_ANA_TORQUE			A10	-	
%	Torque limit when approaching the fixed stop for analog drives			DOUBLE	PowerOn	
CTEQ						
-	-	5.0	0.0	100.0	7/2	M

Description:

Only for analog drives (not relevant for PROFIdrive digital drives):

This machine data defines an internal NC torque limit for analog drives. It is specified as a percentage of the maximum drive torque (corresponds to % of max. current setpoint with FDD).

This torque limit is active in the NC from the start of the motion (acceleration torque) until the instant the fixed stop is reached.

The torque limit must have the same effect as the torque limit set in the drive.

This torque limit is required to ensure that:

- There are no step changes in torque during switchover from speed-controlled to current-controlled or torque-controlled operation
- The acceleration is reduced to the correct value in the NC

2.3 NC machine data

37080	FOC_ACTIVATION_MODE			A10	-	
-	Initial setting of modal torque/force limitation			UBYTE	PowerOn	
-						
-	-	0x0	0x0	0x3	7/2	M

Description: The initial setting of the modal torque/force limitation is set with this MD after reset and PowerOn:

Bit 0: Response after PowerON

= 0 : FOCOF

= 1 : FOCON (modal)

Bit 1: Response after reset

= 0 : FOCOF

= 1 : FOCON (modal)

Default setting: FOCOF after reset and PowerOn

37090	COLLISION_EXT_AXIS_MASK			EXP	-	
-	Settings of the external collision avoidance			UDWORD	PowerOn	
-						
-	-	0x1	0x0	0x3	7/2	M

Description: Settings of the external collision avoidance:

Bit 0: Braking response

= 0 : Braking signals are ignored

= 1 : Braking signals are effective

Bit 1: reserved

37100	GANTRY_AXIS_TYPE			A01, A10	G1, TE1, Z3	
-	Gantry axis definition			BYTE	PowerOn	
CTEQ						
-	-	0	0	33	7/2	M

Description: General: decimal representation, with a b

a

0: Leading axis

1: Synchronized axis

b

0: No gantry axis

1: Axis in gantry grouping 1

2: Axis in gantry grouping 2

3: Axis in gantry grouping 3

...

A max. of 8 gantry groupings is possible.

Examples:

11: Axis is a synchronized axis in a gantry grouping 1

2: Axis is a leading axis in gantry a grouping 2

12: Axis is a synchronized axis in a gantry grouping 2

3: Axis is a leading axis in a gantry grouping 3

13: Axis is a synchronized axis in a gantry grouping 3

Special cases:

Alarm 10650 "Incorrect gantry machine data" and 10651 "Gantry unit not defined" in the case of an incorrect gantry axis definition.

Related to:

MD37110 \$MA_GANTRY_POS_TOL_WARNING (gantry warning limit)

MD37120 \$MA_GANTRY_POS_TOL_ERROR (gantry trip limit)

MD37130 \$MA_GANTRY_POS_TOL_REF (gantry trip limit during referencing)

37110	GANTRY_POS_TOL_WARNING			A05, A10	G1, Z3	
mm, degrees	Gantry warning limit			DOUBLE	Reset	
-						
-	-	0.0	-1e15	1e15	7/2	M

Description:

Value > 0

With gantry axes, the difference between the actual position values of the leading and synchronized axes is constantly monitored.

MD37110 \$MA_GANTRY_POS_TOL_WARNING is used to define a limit value for the actual position value difference; when the limit is exceeded, warning 10652 "Warning limit exceeded" is output. However, the gantry axes are not stopped internally in the control. The warning threshold must therefore be selected so that the machine can withstand the actual position value deviation between the gantry axes without sustaining mechanical damage.

Furthermore, the NC/PLC interface signal DB31, ... DBX101.3 (Gantry warning limit exceeded) to the PLC is set to "1". The PLC user program can thus initiate the necessary measures (e.g. program interruption at block end) when the warning limit is exceeded.

As soon as the actual current position value difference has dropped below the warning limit again, the message is canceled and the interface signal "Gantry warning limit exceeded" is reset.

Effect of the gantry warning limit on the gantry synchronization process:

The actual position value difference between the leading and synchronized axes is determined during gantry synchronization. If the deviation is less than the gantry warning limit, the synchronizing motion of the gantry axes is automatically started internally in the control.

Otherwise the synchronizing motion has to be initiated via the PLC interface (interface signal DB31, ... DBX29.4 (Start gantry synchronization process))

Value = 0

The setting MD37110 \$MA_GANTRY_POS_TOL_WARNING = 0 is the monitoring for violation of the warning limit deactivated.

The gantry synchronization is not initiated internally in the control.

Special cases:

Alarm 10652 "Warning limit exceeded" in response to violation of the gantry warning limit.

mm, degrees	Gantry trip limit			DOUBLE	PowerOn	
-						
-	-	0.0	-1e15	1e15	7/2	M

2.3 NC machine data

Description:

With gantry axes, the difference between the actual position values of the leading and synchronized axes is continuously monitored. MD37120 \$MA_GANTRY_POS_TOL_ERROR defines the maximum permissible deviation in actual position value between the synchronized axis and the leading axis in the gantry axis grouping. Violation of this limit value is monitored only if the gantry axis grouping is already synchronized (NC/PLC interface signal DB31, ... DBX101.5 (Gantry grouping is synchronized) = 1); otherwise the value set in MD37130 \$MA_GANTRY_POS_TOL_REF is used.

When this limit value is exceeded, alarm 10653 "Error limit exceeded" is output. The gantry axes are immediately stopped internally in the control to prevent any damage to the machine.

In addition, the NC/PLC interface signal DB31, ... DBX101.2 (Gantry trip limit exceeded) to the PLC is set to "1".

Special cases:

Alarm 10653 "Error limit exceeded" in response to violation of the gantry trip limit.

37135	GANTRY_ACT_POS_TOL_ERROR			A05, A10	-	
mm, degrees	Current gantry trip limit			DOUBLE	Reset	
-						
-	-	0.0	-MD_DBLMAX	1.0E+301	7/2	M

Description:

Actual value difference between master axis and slave axis in the case of alarm 10653. Leads to alarm 10657 after Power ON.

37140	GANTRY_BREAK_UP			EXP, A01, A10	G1, Z3	
-	Invalidate gantry axis grouping			BOOLEAN	Reset	
CTEQ						
-	-	FALSE	0	-	7/2	M

Description:

GANTRY_BREAK_UP = "0"

The forced coupling of the gantry axis grouping remains valid! Monitoring of violation of the gantry warning or trip limit is active!

GANTRY_BREAK_UP = "1"

This breaks up the forced coupling of the gantry grouping, thus allowing all gantry axes in this grouping to be traversed individually in JOG, AUTOMATIC, and MDI modes. Monitoring for violation of the gantry warning or trip limit is deactivated! The NC/PLC interface signal DB31, ... DBX101.5 "gantry grouping is synchronized" is set to "0".

Notice:

In cases where the gantry axes continue to be mechanically coupled, the machine may sustain damage in this operating state when the leading or synchronized axis is traversed!

The gantry axes cannot be referenced individually.

Corresponds with:

37150	GANTRY_FUNCTION_MASK			A10	-	
-	Gantry functions			UDWORD	Reset	
-						
-	-	0x00	0	0x7	7/2	M

Description:

Special gantry functions are set with this MD.

The MD is bit-coded, the following bits are assigned:

Bit 0 == 0:

Extended monitoring of the actual value difference is inactive.

An offset between master and slave axes occurring in tracking or BREAK_UP is not taken into account in the monitoring of the actual value difference.

Alarm 10657 is not output if alarm 10563 occurs before Power OFF.

Bit 0 = 1:

Extended monitoring of the actual value difference is active.

An offset between master and slave axes occurring in tracking or BREAK_UP is taken into account in the monitoring of the actual value difference.

Prerequisite: The gantry grouping must be rereferenced or resynchronized after control startup.

Alarm 10657 is output if alarm 10563 occurs before Power OFF.

Bit 1 = 0:

Zero mark search direction of the slave axis analogous to MD 34010

Bit 1 = 1:

Zero mark search direction of the slave axis same as for master axis

Bit 2 = 0 :

Alarm 10655 "Synchronization in progress" is output

2.3 NC machine data

Bit 2 = 1

Alarm 10655 "Synchronization in progress" is not output

37160	LEAD_FUNCTION_MASK			A10	M3	
-	Functions for master value coupling			UDWORD	NEW CONF	
CTEQ						
-	-	0x01	0	0x3	1/1	M

Description:

With this MD, special functions of master value coupling are set.

The MD is bit-coded, the following bits are assigned:

Bit 0 = 0:

Dead time compensation is not active at actual value coupling.

Bit 0 = 1:

Dead time compensation is active at actual value coupling.

During actual value coupling, a systematic position offset is created between master and following axis. It is caused by the IPO/position controller dead time between the actual values of master axis and following axis.

For SW 6.4 and higher, this position offset can be compensated by a linear extrapolation of the master value.

Possible velocity fluctuations in the master axis may have an increased impact on the following axis.

The bit must be set for the relevant master axis.

Bit 1 = 0:

The spindle/axis disable of the axis will not become effective with the master value coupling active.

The spindle/axis disable of the master axis becomes effective.

Bit 1 = 1:

The spindle/axis disable is effective for this axis even with the master value coupling active.

The bit must be set for the relevant following axis.

37200	COUPLE_POS_TOL_COARSE			A05, A10	M3, S3, 2.4, 6.2	
mm, degrees	Threshold value for 'Synchronism coarse'			DOUBLE	NEW CONF	
-						
-	-	1.0	0.0	1.0e15	7/2	M

Description:

In synchronous mode, the positional difference between the leading and following axis(axis)/spindle(s) is monitored (only DV and AV mode or cmdpos and actpos in the case of CP programming).

The NC/PLC interface signal DB31, ... DBX98.1 (synchronism coarse) is set if the current positional difference is within the tolerance band specified by the threshold value.

Furthermore, this threshold value can be used to define the criterion for block change on activation of synchronous mode or on modification of the speed ratio parameters when the coupling is active in cases where "synchronism coarse" is selected as the block change response condition (see channel-specific MD21320 \$MC_COUPLE_BLOCK_CHANGE_CTRL_1 or language instruction COUPDEF, WAITC, CPBC).

Entering a value of "0" always sets the NC/PLC interface signal DB31, ... DBX98.1 "synchronism coarse" to "1" in DV/AV mode or with cmd/actpos.

37620	PROFIBUS_TORQUE_RED_RESOL			EXP, A01	-	
%	Resolution PROFIdrive torque reduction			DOUBLE	NEW CONF	
-						
-	-	1.0	0.005	10.0	7/2	M

Description:

For PROFIdrive only:

Resolution of torque reduction on the PROFIdrive (LSB significance)

The MD is only relevant for controls with PROFIdrive drives. For these controls, it defines the resolution of the cyclic interface data "Torque reduction value" (only exists for MD13060 \$MN_DRIVE_TELEGRAM_TYPE = 101 ff. or 201 ff.), which is required for the "Travel to fixed stop" functionality.

The 1% default value corresponds to the original significance. The torque limit is transferred on the PROFIdrive with increments of 1%; the value 100 in the corresponding PROFIdrive message frame data cell corresponds to full torque reduction (i.e. without force).

By changing this MD to 0.005%, for example, the value can be entered in increments of 0.005%, i.e. the increments for the torque limit value become finer by a factor of 200.

For limitation to the rated torque, the value 0 is transmitted in this case; complete torque reduction (i.e. without force) characterizes the transmittable value 10000.

To avoid misadaptation, the setting value of the MD must be selected to match the interpretation configured on the drive side or the firmly defined interpretation of the torque reduction value. If the setting of the control on the drive (manufacturer-specific drive parameter) is known (i.e. with SIEMENS drives), the software automatically sets the MD; in other words, in this case the MD is merely used for display purposes.

Description:

This data defines the outputs for the cam range bits of cam track 1.

Structure see: MD36980 \$MA_SAFE_SVSS_STATUS_OUTPUT

Field index n corresponds to the parameterizable cam range numbers on cam track 1.

The cam range number is defined via the following machine data:

MD36938: \$MA_SAFE_CAM_TRACK_ASSIGN[k]

Signal Meaning

= 0 Axis is not placed on cam with cam range number n

= 1 Axis is placed on cam with cam range number n

Example:

The signal addressed with field index 5 changes to 1 if the axis is placed on the cam to which cam range number 5 on cam track 1 was assigned during parameterization.

Note:

- The "Safe cam track" function is enabled in MD 36903 \$MA_SAFE_CAM_ENABLE.
- If cam range number n on cam track 1 is not parameterized, the signal of the field index can never change to 1. In this case, the output MD with field index n does not have to be parameterized.

This data defines the outputs for the cam range bits of cam track 2.

Structure see: MD36980 \$MA_SAFE_SVSS_STATUS_OUTPUT

Field index n corresponds to the parameterizable cam range numbers on cam track 2.

The cam range number is defined via the following machine data:

MD36938: \$MA_SAFE_CAM_TRACK_ASSIGN[k]

Signal Meaning

= 0 Axis is not placed on cam with cam range number n

= 1 Axis is placed on cam with cam range number n

Example:

The signal addressed with field index 5 changes to 1 if the axis is placed on the cam to which cam range number 5 on cam track 2 was assigned during parameterization.

Note:

- The "Safe cam track" function is enabled in MD 36903 \$MA_SAFE_CAM_ENABLE.
- If cam range number n on cam track 2 is not parameterized, the signal of the field index can never change to 1. In this case, the output MD with field index n does not have to be parameterized.

2.3 NC machine data

37954	SAFE_INFO_MODULE_NR			A01	FBSI	
-	SIC/SCC module number			BYTE	PowerOn	
-						
-	-	1, 2, 3, 4, 5, 6, 7, 8...	1	31	7/2	M

Description: Number to select a logical basis address from MD13374 \$MN_SAFE_INFO_DRIVE_LOGIC_ADDR.

37955	SAFE_STOP_SWITCH_TIME_D_DB			A05	FBSI	
s	Transition time STOP D to safe standstill (storage for p9553)			DOUBLE	Reset	
-						
-	-	0.1	0	1.0E+301	7/1	M

2.3 NC machine data

Description:

This data stores drive parameter p9553 for the 'drive based' SI monitoring. It contains the transition time of STOP D to "Safe operating stop" (SOS). (see description of drive parameter p9553)

Note! Changes to this MD are active after Reset, after PowerOn the value from p9553 is accepted again.

38000	MM_ENC_COMP_MAX_POINTS			A01, A09, A02	K3	
-	Number of intermediate points for interpol. compensation (SRAM)			DWORD	PowerOn	
-						
-	2	0, 0	0	5000	7/2	M

Description:

The number of interpolation points required per measuring system must be defined for the leadscrew error compensation.

The required number can be calculated as follows using the defined parameters:

$$\text{MD38000 } \$\text{MA_MM_ENC_COMP_MAX_POINTS} = \frac{\$ \text{AA_ENC_COMP_MAX} - \$ \text{AA_ENC_COMP_MIN}}{\$ \text{AA_ENC_COMP_STEP}} + 1$$

$\$ \text{AA_ENC_COMP_MIN}$ Initial position (system variable)

$\$ \text{AA_ENC_COMP_MAX}$ End position (system variable)

$\$ \text{AA_ENC_COMP_STEP}$ Distance between interpolation points (system variable)

When selecting the number of interpolation points and/or the distances between them, it is important to take into account the size of the resulting compensation table and the space required in the buffered NC user memory (SRAM). 8 bytes are required for each compensation value (interpolation point).

The index [n] has the following coding: [encoder no.]: 0 or 1

Special cases: Notice:

After any change in MD38000 $\$ \text{MA_MM_ENC_COMP_MAX_POINTS}$, the buffered NC user memory is automatically re-allocated on system power-on.

All data in the buffered NC user memory are then lost (e.g. part programs, tool offsets etc.). Alarm 6020 "Machine data changed - memory reallocated" is output.

If reallocation of the NC user memory fails because the total memory capacity available is insufficient, alarm 6000 "Memory allocation made with standard machine data" is output.

In this case, the NC user memory division is allocated using the default values of the standard machine data.

References:

/FB/, S7, "Memory Configuration"

38010	MM_QEC_MAX_POINTS			A01, A09	K3	
-	Number of values for quadrant error compens. with neural network			DWORD	PowerOn	
-						
-	1	0	0	1040	7/2	M

Description:

In quadrant error compensation with neural networks (QEC), the number of compensation values required has to be entered for each axis that is to be compensated.

The required number can be calculated as follows using the defined parameters: MD38010 $\$ \text{MA_MM_QEC_MAX_POINTS} = (\$ \text{AA_QEC_COARSE_STEPS} + 1) \wedge \$ \text{AA_QEC_FINE_STEPS}$

$\$ \text{AA_QEC_COARSE_STEPS}$ Coarse quantization of the characteristic (system variable)

$\$ \text{AA_QEC_FINE_STEPS}$ Fine quantization of the characteristic (system variable)

For "direction-dependent" compensation, the number must be greater than or equal to double the value of this product.

When selecting coarse or fine quantization, the resulting size of the compensation table and its memory requirement in the buffered user memory must be taken into account. 4 bytes are required for each compensation value. If the value 0 is entered, no memory is reserved for the table; i.e. the table does not exist and the function cannot therefore be activated.

Special cases: Caution!

If MD38010 \$MA_MM_QEC_MAX_POINTS is altered, the buffered NC user memory is automatically re-allocated on system power-on. This deletes all the user data in the buffered user memory (e.g. drive and HMI machine data, code, tool offsets, part programs etc.).

Note:

For better handling, a large number should be chosen initially, because the exact number of interpolation points that are required is not known when the compensation is started for the first time. This number can be reduced to the required size as soon as the characteristics have been recorded and saved. After performing another power-on, the saved characteristics can be reloaded.

-	No. of points for characteristic approximation of FIR filters for CPRECON			DWORD	PowerOn	
-						
-	2	0, 0	0	100	1/1	M

Description:

The function "Programmable contour accuracy" (G code CPRECON) uses a table for approximating the inverse characteristic of FIR filters. This data states the number of table values. The higher the value, the more exact the approximation.
\$MA_AX_JERK_FIR_FREQ points are recommended.

2.4 NC setting data

41010	JOG_VAR_INCR_SIZE	-	H1
-	Size of the variable increment for JOG	DOUBLE	Immediately
-			
-	-	0.	-MD_DBLMAX 1.0E+301 7/7 U

Description: This setting data defines the number of increments when variable increment (INCvar) is selected. This increment size is traversed by the axis in JOG mode each time the traverse key is pressed or the handwheel is turned one detent position and variable increment is selected (PLC interface signal "Active machine function: INC variable" for machine or geometry axes is set to 1). The defined increment size also applies to DRF.

Note:

Please note that the increment size is active for incremental jogging and handwheel jogging. So, if a large increment value is entered and the handwheel is turned, the axis might cover a large distance (depends on setting in MD31090 \$MA_JOG_INCR_WEIGHT).

SD irrelevant to

JOG continuous

41050	JOG_CONT_MODE_LEVELTRIGGRD	-	H1
-	Jog mode / continuous operation with continuous JOG	BOOLEAN	Immediately
-			
-	-	TRUE 0	- 7/7 U

Description: 1: Jog mode for JOG continuous

In jog mode (default setting) the axis traverses as long as the traverse key is held down and an axis limitation has not been reached. When the key is released the axis is decelerated to zero speed and the movement is considered complete.

0: Continuous operation for JOG continuous

In continuous operation the traverse movement is started with the first rising edge of the traverse key and continues to move even after the key is released. The axis can be stopped again by pressing the traverse key again (second rising edge).

SD irrelevant for

Incremental jogging (JOG INC)

Reference point approach (JOG REF)

41100	JOG_REV_IS_ACTIVE	-	-
-	JOG mode: revolutional feedrate / linear feedrate	UBYTE	Immediately
-			
-	-	0x0E 0	- 7/7 U

Description: Bit 0 = 0:

The behavior depends on the following:

- in the case of an axis/spindle:

on the axial SD43300 \$SA_ASSIGN_FEED_PER_REV_SOURCE

- in the case of a geometry axis with an active frame with rotation:

on the channel-specific SD42600 \$SC_JOG_FEED_PER_REV_SOURCE

- in the case of an orientation axis:

on the channel-specific SD42600 \$SC_JOG_FEED_PER_REV_SOURCE

Bit 0 = 1:

A JOG motion with revolutional feedrate shall be traversed depending on the master spindle.

The following must be considered:

- If a spindle is the master spindle itself, it will be traversed without revolutional feedrate.

- If the master spindle is in stop position and if SD43300

\$SA_ASSIGN_FEED_PER_REV_SOURCE (with an axis/spindle) or SD42600

\$SC_JOG_FEED_PER_REV_SOURCE (with a geometry axis with an active frame with rotation, or with an orientation axis) = -3, traversing will be carried out without revolutional feedrate.

Bit 1 = 0:

The axis/spindle, geometry axis or orientation axis will be traversed with revolutional feedrate even during rapid traverse (see bit 0 for selection).

Bit 1 = 1:

The axis/spindle, geometry axis or orientation axis is always traversed without revolutional feedback during rapid traverse.

Bit 2 = 0:

The axis/spindle, geometry axis or orientation axis is traversed with revolutional feedrate during JOG handwheel travel, too (see bit 0 for selection).

Bit 2 = 1:

The axis/spindle, geometry axis or orientation axis is always traversed without revolutional feedrate during JOG handwheel travel.

Bit 3 = 0:

The axis/spindle is traversed with revolutional feedrate during DRF handwheel travel, too (see bit 0 for selection).

Bit 3 = 1:

The axis/spindle is always traversed without revolutional feedrate during DRF handwheel travel.

41110	JOG_SET_VELO	-	H1
mm/min	Axis velocity in JOG	DOUBLE	Immediately
-			
-	-	0.0	0.0
		1.0E+301	7/7
			U

Description:

Value not equal to 0:

The velocity value entered applies to linear axes traversed in JOG mode if linear feedrate (G94) is active for the relevant axis (SD41100 \$SN_JOG_REV_IS_ACTIVE = 0).

The axis velocity is active for

- continuous jogging
- incremental jogging (INC1, ... INCvar)
- handwheel traversing.

The value entered is valid for all linear axes and must not exceed the maximum permissible axis velocity (MD32000 \$MA_MAX_AX_VELO).

In the case of DRF, the velocity defined by SD41110 \$SN_JOG_SET_VELO is reduced by MD32090 \$MA_HANDWH_VELO_OVERLAY_FACTOR.

Value = 0:

If 0 has been entered in the setting data, the active linear feedrate in JOG mode is MD32020 \$MA_JOG_VELO "Jog axis velocity". Each axis can be given its own JOG velocity with this MD (axial MD).

SD irrelevant for

2.4 NC setting data

- Linear axes if SD41100 \$SN_JOG_REV_IS_ACTIVE = 1
- Rotary axes (SD41130 \$SN_JOG_ROT_AX_SET_VELO is active here)

Application example(s)

The operator can thus define a JOG velocity for a specific application.

Axial MD32090 \$MA_HANDWH_VELO_OVERLAY_FACTOR (ratio of JOG velocity to handwheel velocity (DRF))

SD41130 \$SN_JOG_ROT_AX_SET_VELO (JOG speed with rotary axes)

41120	JOG_REV_SET_VELO	-	H1
mm/rev	Revolutional feedrate of axes in JOG mode	DOUBLE	Immediately
-			
-	-	0.0	0.0
		1.0E+301	7/7
			U

Description:

Value not equal to 0:

The velocity value entered applies to axes traversed in JOG mode if revolutional feedrate (G95) is active for the relevant axis (SD41100 \$SN_JOG_REV_IS_ACTIVE = 1). The axis velocity is active for

- continuous jogging
- incremental jogging (INC1, ... INCvar)
- handwheel traversing. The value entered is valid for all axes and must not exceed the maximum permissible axis velocity (MD32000 \$MA_MAX_AX_VELO).

Value = 0:

If 0 has been entered in the setting data, the active revolutional feedrate in JOG mode is MD32050 \$MA_JOG_REV_VELO "revolutional feedrate with JOG".

Each axis can be given its own revolutional feedrate with this MD (axial MD).

SD irrelevant for

- For axes if SD41100 \$SN_JOG_REV_IS_ACTIVE = 0

Application example(s)

The operator can define a JOG velocity for a particular application.

Related to

Axial SD41100 \$SN_JOG_REV_IS_ACTIVE (revolutional feedrate for JOG active)

Axial MD32050 \$MA_JOG_REV_VELO (revolutional feedrate with JOG)

Axial MD32000 \$MA_MAX_AX_VELO (maximum axis velocity)

41130	JOG_ROT_AX_SET_VELO	-	H1
rev/min	Axis velocity for rotary axes in JOG mode	DOUBLE	Immediately
-			
-	-	0.0	0.0
		1.0E+301	7/7
			U

Description:

Value not equal to 0:

The velocity entered applies to rotary axes in JOG mode (to continuous jogging, incremental jogging, jogging with handwheel). The value entered is common to all rotary axes, and must not exceed the maximum permissible axis velocity (MD32000 \$MA_MAX_AX_VELO).

With DRF, the velocity set with SD41130 \$SN_JOG_ROT_AX_SET_VELO must be reduced by MD32090 \$MA_HANDWH_VELO_OVERLAY_FACTOR.

Value equal to 0:

If the value 0 is entered in the setting data, the velocity applied to rotary axes in JOG mode is the axial MD32020 \$MA_JOG_VELO (jog axis velocity). In this way, it is possible to define a separate JOG velocity for each axis.

Application example(s)

The operator can define a JOG velocity for a particular application.

Related to

MD32020 \$MA_JOG_VELO (JOG axis velocity)

MD32000 \$MA_MAX_AX_VELO (maximum axis velocity)

41610	CORR_TRAFO_LIN_MAX			EXP	-	
mm	Maximum permissible offset value for offset vectors with CORRTRAFO			DOUBLE	Immediately	
-						
-	-	1.0	0.0	1.0E+301	7/2	M

Description: With the CORRTRAFO function for machine measurement, offset vectors can be modified in the kinematic model of a machine.

This setting data limits the maximum permissible change in each component of such a vector to the specified maximum value.

41611	CORR_TRAFO_DIR_MAX			EXP	-	
degrees	Maximum permissible angle deviation for direction vectors with CORRTRAFO			DOUBLE	Immediately	
-						
-	-	1.0	0.0	90.0	7/2	M

Description: With the CORRTRAFO function for machine measurement, the direction vectors of rotary axes can be modified in the kinematic model of a machine.

This setting data limits the maximum permissible angle change of such a vector to the specified maximum value.

41612	CORR_TOCARR_LIN_MAX			EXP	-	
mm	Maximum permissible compensation value for offset vectors with CORRTC			DOUBLE	Immediately	
-						
-	-	1.0	0.0	1.0E+301	7/2	M

Description: Offset vectors in the kinematic model of a tool carrier can be modified using the CORRTC function for tool carrier measurement.

This setting data limits the maximum permissible change in each component of such a vector to the stated maximum value.

41670	SINGULARITY_THRESHOLD			-	-	
-	Threshold value for singularity detection.			DOUBLE	Immediately	
-						
-	-	2.0e-6	0.0	1.0E+301	7/7	U

Description: This SD specifies the threshold value for detecting singularities in the programmed blocks.

If the values of this SD are too high, unnecessary singularity handlings will be performed, which can also lead to unnecessary contour deviations.

If the values of this SD are too low, not all singular positions will be detected and handled.

The value 2.0e-6 is recommended.

41671	MIN_DIST_TO_SINGULARITY			-	-	
-	Minimum distance to singularity point.			DOUBLE	Immediately	
-						
-	-	1.0e-3	1.0e-5	1.0E+301	7/7	U

Description: This SD specifies the minimum distance to the singularity point in the programmed blocks.

Blocks which have the positions between the value in SD41670 \$SD_SINGULARITY_THRESHOLD and this SD are analyzed more intensively.

The value 1.0e-3 is recommended.

mm	Acceleration behavior of axis when thread cutting			DOUBLE	Immediately	
-						
-	3	-1., -1., -1., -1., -1., -1., -1., -1., -1., -1., -1., -1., -1.,...	-1., -1., -1.	999999., 999999., 0.	7/7	U

604

The corner is left with hard retraction, the axes follow the specification of the control loops.

> 0:

Reserved for an expansion of the function.

The 3rd value defines the geometric tolerance that may be used at a corner between 2 thread blocks in order to soften the transition:

< or = 0:

The corner is left with hard retraction, the axes follow the specification of the control loops.

> 0:

The transition is made as geometrically soft as possible by using this tolerance.

42100	DRY_RUN_FEED			-	V1	
mm/min	Dry run feedrate			DOUBLE	Immediately	
-						
-	-	5000., 5000., 5000., 5000., 5000., 5000., 5000., 5000....	0.0	1.0E+301	7/7	U

Description:

The feedrate for the active dry run is entered in this setting data. The setting data can be altered on the operator panel in the "Parameters" operating area.

The entered dry run feedrate is always interpreted as a linear feed (G94). If the dry run feedrate is activated via the PLC interface, the dry run feedrate is used as the path feed after a reset instead of the programmed feed. The programmed velocity is used for traversing if it is greater than the velocity stored here.

Application example(s)

Program testing

Related to

42101	DRY_RUN_FEED_MODE			-	V1	
-	Mode for dry run velocity			BYTE	Immediately	
-						
-	-	0, 0, 0, 0, 0, 0, 0, 0...	0	12	7/7	U

Description:

This SD can be used to set the method of operation of the dry run velocity set by SD42100 \$SC_DRY_RUN_FEED.

The following values are possible:

0:

The maximum of SD42100 \$SC_DRY_RUN_FEED and the programmed velocity become active. This is the standard setting and corresponds to the behavior up to SW 5.

1:

The minimum of SD42100 \$SC_DRY_RUN_FEED and the programmed velocity become active.

2:

SD42100 \$SC_DRY_RUN_FEED becomes active directly, irrespective of the programmed velocity.

The values 3...9 are reserved for extensions.

10:

As configuration 0, except for thread cutting (G33, G34, G35) and tapping (G331, G332, G63). These functions are executed as programmed.

11:

As configuration 1, except for thread cutting (G33, G34, G35) and tapping (G331, G332, G63). These functions are executed as programmed.

2.4 NC setting data

12:

As configuration 2, except for thread cutting (G33, G34, G35) and tapping (G331, G332, G63). These functions are executed as programmed.

42110	DEFAULT_FEED			-	V1, FBFA

-						
-	-	0., 0., 0., 0., 0., 0., 0., 0., 0....	-	-	7/7	U

Description: Default value for the path feed in adjustment movements of tangential axes on activation of a tangential axis coupling during or after block search.

The content of this setting data is only used if it is not equal to zero and bit7 = 0 of MD \$MN_SEARCH_RUN_MODE is set.

It is evaluated as an F-word programmed in G94.

42122	OVR_RAPID_FACTOR			-	MD12050 \$MN_OVR_FACTOR_RAPID_T RA, \$AC_OVR	
%	Add. rapid traverse override can be specified through operation			DOUBLE	Immediately	
-						
-	-	100., 100., 100., 100., 100., 100., 100., 100....	0.0	1.0E+301	7/7	U

Description: Additional channel-specific rapid traverse override in %. The value is calculated as a function of the OPI variable enablOvrRapidFactor on the path and during jogging of geometry axes. The value multiplies the other overrides relevant to rapid traverse (rapid traverse override of the machine control panel, override default through synchronized actions \$AC_OVR).

42125	SERUPRO_SYNC_MASK			-	-	
-	Synchronization in approach blocks			DWORD	Immediately	
-						
-	-	0, 0, 0, 0, 0, 0, 0, 0...	-	-	7/7	U

Description:

A synchronized approach can be set for the search type SERUPRO with the setting data SERUPRO_SYNC_MASK.

SERUPRO uses the function REPOS to move from the current machine position to the target block of the search. A synchronization of the channels can be forced between the reapproach block and the target block via SERUPRO_SYNC_MASK which would correspond to the use of WAIT markers.

Note:

The user cannot program WAIT markers between reapproach block and target block in a part program.

SERUPRO_SYNC_MASK activates this internal WAIT marker, and defines for which other channels this channel is to wait.

Example for channel 3: SD42125 \$SC_SERUPRO_SYNC_MASK= 0x55

A new block is now inserted in the Serupro approach between the reapproach block and the target block, the function of which corresponds to the following programming: WAITM(101, 1,3,5,7), i.e. a WAIT marker synchronizes the channels 1, 3, 5 and 7.

The WAIT markers used internally cannot be explicitly programmed by the user.

NOTICE:

Similarly to the part program, the user can make the error of not setting the marker in a channel, so that the other channels naturally wait for ever!

Note:

The bit mask can contain a channel that does not exist (channel gaps) without a deadlock occurring.

Example for channel 3: SD42125 \$SC_SERUPRO_SYNC_MASK= 0x55 and channel 5 do not exist, so WAITM(101, 1,3,7) is set.

Note: The block content corresponds to "WAITM(101, 1,3,5,7)", the user does not see this block content, he sees REPOSA!

Note:

SERUPRO_SYNC_MASK is evaluated as soon as the part program command REPOSA is interpreted.

SERUPRO_SYNC_MASK can still be changed if SERUPRO is in the state "search target found".

If REPOSA has already been executed, a change to SERUPRO_SYNC_MASK can only become active if a new REPOS is set. This occurs, for example, by:

- Starting a new ASUB.
- STOP-JOG-AUTO-START
- STOP - select a new REPOS mode RMI/RMN/RME/RMB - START

Note:

If one uses the prog. event for search and if the NCK is at alarm 10208 then a change of SERUPRO_SYNC_MASK is not active unless one sets a new REPOS.

SERUPRO_SYNC_MASK == 0 A block is NOT inserted.

Note:

If the bit for the current channel is not set in SD42125 \$SC_SERUPRO_SYNC_MASK then a block is NOT inserted.

Example:

If SD42125 \$SC_SERUPRO_SYNC_MASK= 0xE is programmed in channel 1, then a block is NOT inserted.

This assignment is reserved for a future function!

42140	DEFAULT_SCALE_FACTOR_P	-	FBFA
-	Default scaling factor for address P	DWORD	Immediately
-			
-	-	1, 1, 1, 1, 1, 1, 1, 1...	- - 7/7 U

2.4 NC setting data

Description: The value in this machine data is active if no scaling factor P has been programmed in the block.

Related to:

WEIGHTING_FACTOR_FOR_SCALE

42150	DEFAULT_ROT_FACTOR_R			-	-	
-	Default rotation factor for address R			DOUBLE	Immediately	
-						
-	-	0., 0., 0., 0., 0., 0., 0., 0....	-MD_DBLMAX	1.0E+301	7/7	U

Description: The value in this machine data is active if no factor for rotation R is programmed in the block.

42160	EXTERN_FIXED_FEEDRATE_F1_F9			-	FBFA	
-	Fixed feedrates F1 - F9			DOUBLE	Immediately	
-						
-	10	0., 0., 0., 0., 0., 0., 0., 0., 0., 0., 0., 0., 0., 0., 0., ...	0.0	1.0E+301	7/7	U

Description: Fixed feedrate values for programming with F1 - F9. If the machine data \$MC_FEEDRATE_F1_F9_ON = TRUE is set with the programming of F1 - F9, the feedrate values are read from SD42160 \$SC_EXTERN_FIXED_FEEDRATE_F1_F9[0] - SD42160 \$SC_EXTERN_FIXED_FEEDRATE_F1_F9[8], and activated as the machining feedrate. The rapid traverse feedrate must be entered in SD42160 \$SC_EXTERN_FIXED_FEEDRATE_F1_F9[0].

42162	EXTERN_DOUBLE_TURRET_DIST			-	FBFA	
-	Double turret head tool distance			DOUBLE	Immediately	
-						
-	-	0., 0., 0., 0., 0., 0., 0., 0....	0.0	1.0E+301	7/7	U

Description: Distance between both tools of a double turret head.
The distance is activated using G68 as additive zero point offset if MD10812 \$MN_EXTERN_DOUBLE_TURRET_ON is set to TRUE.

42200	SINGLEBLOCK2_STOPRE			-	BA	
-	Activate SBL2 debug mode			BOOLEAN	Immediately	
-						
-	-	FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE...	0	-	7/7	U

Description: Value = TRUE:
A preprocessing stop is made with every block if SBL2 (single block with stop after every block) is active. This suppresses the premachining of part program blocks. This variant of the SBL2 is not true-to-contour.
This means that a different contour characteristic might be generated as a result of the preprocessing stop than without single block or with SBL1.
Application: Debug mode for testing part programs.

Description:	Together with SD42222 \$SC_CFG_STOP_MASK and SD42224 \$SC_CFG_STOP_ARRAY_MASK, this setting data defines the reasons for the configured stop. For example, NC language function identifiers and subprogram names as strings are permissible entries. Initially, the entry is restricted to M/H/T/D auxiliary functions or calls and subprogram names. Examples: Auxiliary functions M=87, H[13]=*, T[*]=5 and subprogram name N CS TOOL
---------------------	---

Description:	This setting data states the stop mask for the G code transitions. Configured stop for: Bit 0 Transition G0 to G0 Bit 1 Transition G0 to not-G0 Bit 2 Transition not-G0 to G0
---------------------	---

Description:	This setting data activates the stop handling of the functions defined by CFG_STOP_ARRAY
Bit 0	SD42220 \$SC_CFG_STOP_ARRAY[0]
Bit 1	SD42220 \$SC_CFG_STOP_ARRAY[1]
Bit n	SD42220 \$SC_CFG_STOP_ARRAY[n]

Description:	This setting data defines the speed ratio for the fixed coupling configuration defined with the channel-specific MD21300 \$MC_COUPLE_AXIS_1[n]. The linear correlation between the leading and following spindles is determined by the speed ratio. The speed ratio is defined by the specification of the numerator and the denominator. Speed ratio = numerator / denominator = SD42300 \$SC_COUPLE_RATIO[0] / SD42300 \$SC_COUPLE_RATIO[1] The speed ratio parameters can be altered in the NC part program with the language instruction COUPDEF provided that this is not locked by the channel-specific MD21340 \$MC_COUPLE_IS_WRITE_PROT_1. However, the parameterized values of SD42300 \$SC_COUPLE_RATIO_1 are not changed. The calculation of the speed ratio is initiated with Power On.
---------------------	---

2.4 NC setting data

42400	PUNCH_DWELLTIME	-	N4
s	Dwell time for punching and nibbling	DOUBLE	Immediately
-			
-	-	1.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0...	0.0 1.0E+301 7/7 U

Description: This data sets the dwell time between reaching the position and triggering the stroke. The set value is rounded to an integer multiple of the interpolation cycle. (This means that the value set here can only differ slightly from that which is actually executed.)

Note:

MD10710 \$MN_PROG_SD_RESET_SAVE_TAB can be set so that the value written by the part program is transferred into the active file system on reset (i.e. the value is retained even after the reset).

42402	NIBPUNCH_PRE_START_TIME	-	N4
s	Delay time (punch/nibble) with G603	DOUBLE	Immediately
-			
-	-	.02, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0...	0.0 1.0E+301 7/7 U

Description: This setting data has exactly the same effect as MD26018 \$MC_NIBBLE_PRE_START TIME. Its primary purpose is to allow the pre-start time to be altered from the NC program so that it can be adapted to different metal sheet sizes and thicknesses. However, the setting data is active only when the machine data has been set to zero.

Related to NIBBLE_PRESTART_TIME

42404	MINTIME_BETWEEN_STROKES	-	N4
s	Minimum time between 2 strokes in seconds	DOUBLE	Immediately
-			
-	-	0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0...	0.0 1.0E+301 7/7 U

Description: Minimum time between 2 strokes in seconds

42440	FRAME_OFFSET_INCR_PROG	-	K1, K2
-	Work offsets in frames	BOOLEAN	Immediately
-			
-	-	TRUE, TRUE, TRUE, TRUE, TRUE, TRUE, TRUE, TRUE...	0 - 7/7 U

Description: 0: When incremental programming is used on an axis, only the programmed position delta is traversed after a frame change. Work offsets in FRAMES are only traversed when an absolute position is specified.

1: When incremental programming is used on an axis, changes to work offsets are traversed after a frame change (standard response up to software version 3).

Description: This setting data defines the maximum contour tolerance in the compressor.

42476	COMPRESS_ORI_TOL	-	F2, PGA
degrees	Maximum deviation of tool orientation with compressor	DOUBLE	Immediately
-			
-	-	0.05, 0.05, 0.05, 0.05, 0.05, 0.05, 0.05, 0.05...	0.000001 90. 7/7 U

Description: This setting data defines the maximum tool orientation tolerance in the compressor. This data defines the maximum permissible angular displacement of the tool orientation.

This data is active only if an orientation transformation is active.

42477	COMPRESS_ORI_ROT_TOL	-	F2, PGA
degrees	Maximum deviation of tool rotation with compressor	DOUBLE	Immediately
-			
-	-	0.05, 0.05, 0.05, 0.05, 0.05, 0.05, 0.05, 0.05...	0.000001 90. 7/7 U

Description: This setting data defines the maximum tolerance in the compressor for turning the tool orientation. This data defines the maximum permissible angular displacement of the tool rotation.

This data is only active if an orientation transformation is active.

Turning the tool orientation is only possible with 6-axis machines.

42478	SURF_PERF_ADJUST	EXP, C09	-
mm	Adaptation of the CPU time utilization with COMPSURF.	DOUBLE	Immediately
-			
-	-	0.005, 0.005, 0.005, 0.005, 0.005, 0.005, 0.005, 0.005...	0.0001 0.1 1/1 M

Description: Represents a compromise between computational utilization and accuracy. The higher the value, the lower the computational utilization, the lower the value the higher the accuracy.

A sharper surface can be achieved, especially by COMPSURF with "Smoothing off" (MIN_SURF_RADIUS = 0).

2.4 NC setting data

42480	STOP_CUTCOM_STOPRE			-	W1	
-	Alarm response with tool radius compensation and preproc. stop			BOOLEAN	Immediately	
-						
-	-	TRUE, TRUE, TRUE, TRUE, TRUE, TRUE, TRUE, TRUE...	0	-	7/7	U

Description: If this setting data is TRUE, block execution is stopped by preprocessing stop and active tool radius compensation, and does not resume until after a user acknowledgment (START).

If it is FALSE, machining is not interrupted at such a program point.

42490	CUTCOM_G40_STOPRE			-	W1	
-	Retraction behavior of tool radius compensation with prep. stop			BOOLEAN	Immediately	
-						
-	-	FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE...	0	-	7/7	U

Description: FALSE:

If there is a preprocessing stop (either programmed or generated internally by the control) before the deselection block (G40) when tool radius compensation is active, then firstly the starting point of the deselection block is approached from the last end point before the preprocessing stop. The deselection block itself is then executed, i.e. the deselection block is usually replaced by two traversing blocks. Tool radius compensation is no longer active in these blocks. The behavior is thus identical with that before the introduction of this setting data.

TRUE:

If there is a preprocessing stop (either programmed or generated internally by the control) before the deselection block (G40) when tool radius compensation is active, the end point of the deselection point is traversed in a straight line from the last end point before the preprocessing stop.

42494	CUTCOM_ACT_DEACT_CTRL			-	W1	
-	Approach & retraction behavior with 2-1/2D tool radius compens.			DWORD	Immediately	
-						
-	-	2222, 2222, 2222, 2222, 2222, 2222, 2222, 2222...	-	-	7/7	U

Description: This setting data controls the approach and retraction behavior with tool radius compensation if the activation or deactivation block does not contain any traversing information. It is only evaluated with 2-1/2D TRC

(CUT2D or CUT2DF).

The decimal coding is as follows:

N N N N

| | | | ____ Approach behavior for tools with tool point direction
(turning tools)

| | | ____ Approach behavior for tools without tool point direction
(milling tools)

| | ____ Retract behavior for tools with tool point direction
(turning tools)

| ____ Retract behavior for tools without tool point direction
(milling tools)

If the position in question contains a 1, approach or retraction is always performed, even if G41/G42 or G40 stands alone in a block.

For example:

```
N100 x10 y0
```

```
N110 G41
```

```
N120 x20
```

If a tool radius of 10mm is assumed in the above example, position x10y10 is approached in block N110.

If the position in question contains the value 2, the approach or retraction movement is only performed if at least one geometry axis is programmed in the activation/deactivation block. To obtain the same results as the above example with this setting, the program must be altered as follows:

```
N100 x10 y0
```

```
N110 G41 x10
```

```
N120 x20
```

If axis information x10 is missing in block N110, activation of TRC is delayed by one block, i.e. the activation block would now be N120.

If the position in question contains a 3, retraction is not performed in a deactivation block (G40) if only the geometry axis perpendicular to the compensation plane is programmed. In this case, the motion perpendicular to the compensation plane is performed first. This is followed by the retraction motion in the compensation plane. In this case, the block after G40 must contain motion information in the compensation plane. The approach motions for values 2 and 3 are identical.

If the position in question contains a value other than 1, 2 or 3, i.e. in particular the value 0, an approach or retraction movement is not performed in a block that does not contain any traversing information.

About the term "Tools with tool point direction":

These are tools with tool numbers between 400 and 599 (turning and grinding tools), whose tool point direction has a value between 1 and 8. Turning and grinding tools with tool point direction 0 or 9 or other undefined values are treated like milling tools.

Note:

If the value of this setting data is changed within a program, we recommend programming a preprocessing stop (stopre) before the description to avoid the new value being used in program sections before that point. The opposite case is not serious, i.e. if the setting data is written, subsequent NC blocks will definitely access the new value.

42496	CUTCOM_CLSD_CONT			-	-	
-	Tool radius compensation behavior with closed contour			BOOLEAN	Immediately	
-						
-	-	TRUE, TRUE, TRUE, TRUE, TRUE, TRUE, TRUE...	0	-	7/7	U

Description:

FALSE:

CASE A: If two intersections arise on correction of the inner side with an (almost) closed contour consisting of two successive circle blocks or an (almost) closed full circle, by default the intersection is chosen that is located on the first partial contour nearer to the beginning of the block.

Contours can be omitted with this procedure.

A contour is considered (almost) closed if the distance between the starting point of the first block and the end point of the second block or the starting and end points of the almost closed full circle is less than 10% of the active compensation radius, but not greater than 1000 path increments (corresponds to 1 mm with 3 decimal places).

2.4 NC setting data

CASE B: If on correction of the inner side and a block transition between a straight line and a circle with an angle of aperture of more than approx. 315 degrees, the offset curve of the straight line intersects the offset curve of the circle at two points, by default the point of intersection is chosen that is located on the first partial contour nearer to the beginning of the block.

In this situation, the two curves involved are almost completely excluded.

TRUE:

In the same situations as described above, the intersection on the first partial contour that lies nearer to the end of the block is selected. Thus more of the two partial contours is retained. This is the better procedure for achieving the programmed original contour.

With (almost) closed contours, it is generally always better to divide contours into partial contours (e.g. instead of a full circle, program two half circles) so that the tool radius compensation can find the unambiguous intersection.

CASE A: With two successive curves (as described above), whose offset curves intersect twice, the intersection is chosen that lies nearer to the end of the first curve.

A slight contour violation at the beginning of the block of the first curve and at the end of the block of the second curve is accepted in order to be able to completely machine both curves. But only if the contour is (almost) closed (see above definition).

CASE B: In the same situation as described above, the intersection which lies nearer to the end of the first curve is selected.

But only if the absolute value of the contour violation caused by this is less than the permanently assigned tolerance of 0.002 mm.

SD42510 \$SC_SD_MAX_PATH_JERK (SD for additional limitation of (tangential) path jerk)

42520	CORNER_SLOWDOWN_START			-	-	
mm	Start of feed reduction at G62.			DOUBLE	Immediately	
-						
-	-	0., 0., 0., 0., 0., 0., 0., 0....	0.0	1.0E+301	7/7	U

Description: Traverse path distance from which the feed is reduced before the corner with G62.

42522	CORNER_SLOWDOWN_END			-	-	
mm	End of feed reduction at G62.			DOUBLE	Immediately	
-						
-	-	0., 0., 0., 0., 0., 0., 0., 0....	0.0	1.0E+301	7/7	U

Description: Traverse path distance up to which the feed remains reduced after a corner with G62.

42524	CORNER_SLOWDOWN_OVR			-	-	
%	Feed override reduction at G62			DOUBLE	Immediately	
-						
-	-	0., 0., 0., 0., 0., 0., 0., 0....	0.0	1.0E+301	7/7	U

Description: Override used to multiply the feed at the corner with G62.

2.4 NC setting data

42526	CORNER_SLOWDOWN_CRIT			-	-	
degrees	Corner detection at G62			DOUBLE	Immediately	
-						
-	-	0., 0., 0., 0., 0., 0., 0., 0., 0....	0.0	1.0E+301	7/7	U

Description: Angle from which a corner is taken into account when reducing the feed with G62.
For example SD42526 \$SC_CORNER_SLOWDOWN_CRIT = 90 means that all corners of 90 degrees or a more acute angle are traversed slower with G62.

42528	CUTCOM_DECEL_LIMIT			-	-	
-	Feed lowering on circles with tool radius compensation			DOUBLE	Immediately	
-						
-	-	0., 0., 0., 0., 0., 0., 0., 0., 0....	0.	1.	7/7	U

Description: The setting data limits feed lowering of the tool center point on concave circle segments with tool radius compensation active and CFC or CFIN selected.
With CFC, the feed is defined at the contour. On concave circular arcs, feed lowering of the tool center point is created by the ratio of the contour curvature to the tool center point path curvature. The setting data is limiting this effect, reducing backing off and overheating of the tool.
For contours with varying curvatures, a mid-range curvature is used.
0: Provides the previous behavior: If the ratio between contour radius and tool center point path radius is less than or equal to 0.01 the feed is applied to the tool center point path. Less pronounced feed reductions are executed.
>0: Feed lowering is limited to the programmed factor. At 0.01, this means that the feed of the tool center point path is possibly only 1 percent of the programmed feed value.
1: On concave contours, the tool center point feed equals the programmed feed (the behavior then corresponds to CFTCP).

42600	JOG_FEED_PER_REV_SOURCE			-	V1	
-	Control revolutional feedrate in JOG			DWORD	Immediately	
-						
-	-	0, 0, 0, 0, 0, 0, 0, 0...	-3	31	7/7	U

Description: The revolutionary feedrate in JOG mode for geometry axes on which a frame with rotation acts.
0= No revolutionary feedrate is active.
>0= Machine axis index of the rotary axis/spindle from which the revolutionary feedrate is derived.
-1= The revolutionary feedrate is derived from the master spindle of the channel in which the axis/spindle is active.
-2= The revolutionary feedrate is derived from the axis with machine axis index == 0.
-3= The revolutionary feedrate is derived from the master spindle of the channel in which the axis/spindle is active. No revolutionary feedrate is active if the master spindle is at a standstill.
Related to
SD43300: \$SA_ASSIGN_FEED_PER_REV_SOURCE (revolutional feedrate for position axes/spindles)

42650	CART_JOG_MODE			-	H1	
-	Coordinate system for Cartesian jog traverse			DWORD	Immediately	
-						
-	-	0x0, 0x0, 0x0, 0x0, 0x0, 0x0, 0x0, 0x0...	0	0x0404	7/7	U

Description: This SD can be used to set the reference coordinate system for Cartesian manual travel, with bits 0 to 7 provided for selecting the coordinate system for translation, bits 8 to 15 for selecting the reference system for orientation.

Cartesian manual travel will not be enabled if no bit is set or if just one bit is set for translation or for orientation. This means that one bit must always be set for translation and one for orientation. Cartesian manual travel will also not be enabled if more than one bit is set for translation or orientation.

The meaning of the individual bits is defined as follows :

Bit 0 : Translation in Basic Coordinate System
 Bit 1 : Translation in Workpiece Coordinate System
 Bit 2 : Translation in Tool Coordinate System
 Bit 3 : reserved
 Bit 4 : reserved
 Bit 5 : reserved
 Bit 6 : reserved
 Bit 7 : reserved
 Bit 8 : Orientation in Basic Coordinate System
 Bit 9 : Orientation in Workpiece Coordinate System
 Bit 10 : Orientation in Tool Coordinate System
 Bit 11 : reserved
 Bit 12 : reserved
 Bit 13 : reserved
 Bit 14 : reserved
 Bit 15 : reserved

42660	ORI_JOG_MODE			-	-	
-	Definition of virtual kinematics for JOG			DWORD	Immediately	
-						
-	-	0, 0, 0, 0, 0, 0, 0, 0...	0	5	7/7	U

Description: This SD can be used to define virtual kinematics, which become active for the manual travel of orientations.

This setting data is evaluated only by the generic 5/6-axis transformation. This data has no meaning for OEM transformations.

The following setting options are available:

0: The virtual kinematics are defined by the transformation.

1: Euler angles are traversed during jog, that is the 1st axis turns round the Z direction, the 2nd axis turns around the X direction and, if present, the 3rd axis turns around the new Z direction.

2: RPY angles are traversed during jog with the turning sequence XYZ, that is the 1st axis turns around the x direction, the 2nd axis turns around the Y direction and, if present, the 3rd axis turns around the new Z direction.

3: RPY angles are traversed during jog with the turning sequence ZYX, that is the 1st axis turns around the Z direction, the 2nd axis turns around the Y direction and, if present, the 3rd axis turns around the new X direction.

4: The turning sequence of the rotary axes is set by means of MD21120 \$MC_ORIAX_TURN_TAB_1.

2.4 NC setting data

5: The turning sequence of the rotary axes is set by means of MD21130
\$MC_ORIAX_TURN_TAB_2.

42664	OFF_ORI_LIMIT			-	-	
degrees	Maximum angles for the override of the orientation [0] Maximum angles for the orientation vector [1] Maximum angles for the rotation vector with 6-axis kinematics			DOUBLE	Immediately	
-						
-	2	90.0, 90.0, 90.0, 90.0, 90.0, 90.0, 90.0, 90.0, 90.0, 90.0, 90.0...	0.0	1.0E+301	7/7	U

Description: The maximum angles for the maximum possible override of the current tool orientation can be specified with the system variables \$AC_OFF_O, \$AC_OFF_R, \$AC_OFF_LEAD, \$AC_OFF_TILT and \$AC_OFF_THETA.

\$AC_OFF_ORI_LIMIT[0]: Maximum angle for the vector of the tool orientation

\$AC_OFF_ORI_LIMIT[1]: Maximum angle for the rotation vector (only with 6-axis kinematics)

If an override of the tool orientation is specified that is larger than the maximum angles, this is shown in the system variable \$AC_OFF_ORI_LIMIT.

42670	ORIPATH_SMOOTH_DIST			-	-	
mm, degrees	Path for smoothing the orientation			DOUBLE	Immediately	
-						
-	-	0.05, 0.05, 0.05, 0.05, 0.05, 0.05, 0.05, 0.05...	0.0	1.0E+301	7/7	U

Description: Displacement by which a jump in the tool orientation is smoothed with ORIPATH path-relative orientation interpolation. There is a deviation within this displacement from the relation of the orientation to the path tangent and the surface normal vector programmed with LEAD/TILT.

If zero is entered for this path length (SD42670 \$SC_ORIPATH_SMOOTH_DIST = 0.0), an intermediate block is inserted for smoothing the orientation. This means that the path motion remains at a stop in a corner and the orientation is then turned separately.

42672	ORIPATH_SMOOTH_TOL			-	-	
degrees	Tolerance for smoothing the orientation			DOUBLE	Immediately	
-						
-	-	0.05, 0.05, 0.05, 0.05, 0.05, 0.05, 0.05, 0.05...	0.000001	1.0E+301	7/7	U

Description: Maximum angle (in degrees) for the deviation of the tool orientation with ORIPATH path-relative orientation interpolation. This angular tolerance is used for smoothing a "kink" in the orientation path.

42674	ORI_SMOOTH_DIST			-	-	
mm, degrees	Path for orientation smoothing during smoothing			DOUBLE	Immediately	
-						
-	-	0.05, 0.05, 0.05, 0.05, 0.05, 0.05, 0.05, 0.05...	0.000001	1.0E+301	7/7	U

Description: Path through which a tool orientation bend is smoothed on a block transition with G code OSD.

42676	ORI_SMOOTH_TOL			-	-	
degrees	Tolerance for orientation smoothing during smoothing			DOUBLE	Immediately	
-						
-	-	0.05, 0.05, 0.05, 0.05, 0.05, 0.05, 0.05, 0.05...	0.000001	1.0E+301	7/7	U

Description: Maximum angle (in degree) for the tool orientation deviation during orientation smoothing with G code OST with a bend in the orientation curve on block transitions.

42678	ORISON_TOL			-	-	
degrees	Tolerance for smoothing the orientation			DOUBLE	Immediately	
-						
-	-	10.00, 10.00, 10.00, 10.00, 10.00, 10.00, 10.00, 10.00...	0.0	1.0E+301	7/7	U

Description: Maximum angle (in degree) for the tool orientation deviation during orientation smoothing with the G code ORISON over several blocks.

The tolerance specification with the SD42678 \$SC_ORISON_TOL is valid only if no programmed orientation tolerance (OTOL) is active.

This behavior is the default setting. With MD20478 \$MC_ORISON_MODE, however, this can be changed.

42690	JOG_CIRCLE_CENTRE			-	-	
mm	Center of the circle			DOUBLE	Immediately	
-						
-	3	0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0...	-MD_DBLMAX	1.0E+301	7/7	U

Description: This setting data is used to define the circle center point in the workpiece coordinate system during JOG of circles.

Only the relevant center point coordinates of the geometry axes in the active plane are evaluated, not the coordinate of the geometry axis vertical to the plane. This setting data is written via the user interface.

By default the coordinate of an axis with diameter programming is in the diameter. This can be changed with MD20360 \$MC_TOOL_PARAMETER_DEF_MASK Bit 13 = 1 by indicating a radius.

42691	JOG_CIRCLE_RADIUS			-	-	
mm	Circle radius			DOUBLE	Immediately	
-						
-	-	0, 0, 0, 0, 0, 0, 0, 0...	-MD_DBLMAX	1.0E+301	7/7	U

Description: With this setting data, the circle radius in the machine, the maximum circle during inner machining or the minimum circle during outer machining are defined when jogging circles. This setting data is written via the user interface.

42692	JOG_CIRCLE_MODE			-	-	
-	JOG of circles mode			DWORD	Immediately	
-						
-	-	0, 0, 0, 0, 0, 0, 0, 0...	0	0xf	7/7	U

Description: This setting data sets the following during JOG of circles:

Bit 0 = 0 :

Travel to + creates traversing on a circular path in counterclockwise direction;
travel to - creates traversing in clockwise direction.

2.4 NC setting data

Bit 0 = 1 :

Travel to + creates traversing on a circular path in clockwise direction; travel to - creates traversing in counterclockwise direction.

Bit 1 = 0 :

The tool radius is not taken into account in checking the limitation produced by the specified circle or by the circle segment limited by the start and end angles.

Bit 1 = 1 :

The tool radius is taken into account in checking the limitation produced by the specified circle or by the circle segment limited by the start and end angles.

Bit 2 = 0 :

Internal machining is performed. The circle radius in SD42691 \$SC_JOG_CIRCLE_RADIUS is the maximum possible radius.

Bit 2 = 1 :

External machining is performed. The circle radius in SD42691 \$SC_JOG_CIRCLE_RADIUS is the minimum possible radius.

Bit 3 = 0 :

Given a full circle, the radius is enlarged starting from the circle center point in the direction of the ordinate (2nd geometry axis) of the plane.

Bit 3 = 1 :

Given a full circle, the radius is enlarged starting from the circle center point in the direction of the abscissa (1st geometry axis) of the plane.

This setting data should be written via the user interface.

42693	JOG_CIRCLE_START_ANGLE	-	-
degrees	Circle start angle	DOUBLE	Immediately
-			
-	-	0, 0, 0, 0, 0, 0, 0, 0...	0 360 7/7 U

Description:

This setting data defines the start angle during JOG of circles.

The start angle refers to the abscissa of the current plane. Traversing is only possible within the range

between the start and the end angle. SD42692 \$SC_JOG_CIRCLE_MODE bit 0 defines the direction from the start to the end angle. If start and end angle equal zero, no limitation is active.

This setting data is written via the user interface.

42694	JOG_CIRCLE_END_ANGLE	-	-
degrees	Circle end angle	DOUBLE	Immediately
-			
-	-	0, 0, 0, 0, 0, 0, 0, 0...	0 360 7/7 U

Description:

This setting data defines the end angle during JOG of circles.

The end angle refers to the abscissa of the current plane. Traversing is only possible within the range

between the start and the end angle. SD42692 \$SC_JOG_CIRCLE_MODE bit 0 defines the direction from the start to the end angle. If start and end angle equal zero, no limitation is active.

This setting data is written via the user interface.

42700	EXT_PROG_PATH	-	K1
-	Program path for external subroutine call EXTCALL	STRING	Immediately
-			
-	-	-	- 7/7 U

Description: The total path results from the string chaining of SD42700 \$SC_EXT_PROG_PATH + the programmed subprogram identifier.

42750	ABSBLOCK_ENABLE			-	K1	
-	Enable base block display			BOOLEAN	Immediately	
-						
-	-	TRUE, TRUE, TRUE, TRUE, TRUE, TRUE, TRUE...	0	-	7/7	U

Description: Value 0: Disable basic blocks with absolute values (basic block display)
Value 1: Enable basic blocks with absolute values (basic block display)

42800	SPIND_ASSIGN_TAB			-	S1	
-	Spindle number converter.			BYTE	Immediately	
-						
-	21	0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17,, 0...	0	20	7/7	U

Description: The spindle converter converts the programmed (= logical) spindle number to the physical (= internal, configured) spindle number.
The index of the setting data (SD) corresponds to the programmed spindle number or the programmed address extension.
The SD contains the physical spindle which actually exists.
Special cases, errors,

Notes:

- The zero index (SPIND_ASSIGN_TAB[0]) is only used to display the master spindle (= logical spindle number) selected in the channel, and it must not be overwritten.
- Changes to the spindle converter take effect immediately. Therefore it is not advisable to change the spindle converter for spindles used in a part program from the HMI or PLC while a part program is running.
- After "delete SRAM", the numbers of the logical and physical spindles are identical.

42900	MIRROR_TOOL_LENGTH			-	W1	
-	Sign change of tool length with mirror image machining			BOOLEAN	Immediately	
-						
-	-	FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE...	0	-	7/7	U

Description: TRUE:
If a frame with mirror image machining is active, the tool components (\$TC_DP3[... , ...] to \$TC_DP5[... , ...]) and the components of the base dimensions (\$TC_DP21[... , ...] to \$TC_DP23[... , ...]) whose associated axes are mirrored, are also mirrored, i.e. their sign is inverted. The wear values are not mirrored. If the wear values are to be mirrored too, SD42910 \$SC_MIRROR_TOOL_WEAR must be set.

FALSE:
The sign for tool length components is unaffected by whether a frame with mirror image machining is active.

2.4 NC setting data

42910	MIRROR_TOOL_WEAR			-	W1	
-	Sign change of tool wear with mirror image machining			BOOLEAN	Immediately	
-						
-	-	FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE...	0	-	7/7	U

Description:

TRUE:

If a frame with mirror image machining is activated, the signs of the wear values of the components in question are inverted. The wear values of the components that are not assigned to mirrored axes remain unchanged.

FALSE:

The signs for wear values are unaffected by whether a frame with mirror image machining is active.

42920	WEAR_SIGN_CUTPOS			-	W1	
-	Sign of tool wear depending on tool point direction			BOOLEAN	Immediately	
-						
-	-	FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE...	0	-	7/7	U

Description:

TRUE:

In the case of tools with a relevant tool point direction (turning and grinding tools), the sign for wear of the tool length components depends on the tool point direction.

The sign is inverted in the following cases (marked with an X):

Tool point direction	Length 1	Length 2
1		
2	X	
3	X	X
4		X
5		
6		
7	X	
8		X
9		

The sign for wear value of length 3 is not influenced by this setting data.

The SD42930 \$SC_WEAR_SIGN acts in addition to this setting data.

FALSE:

The sign for wear of the tool length components is unaffected by the tool point direction.

42930	WEAR_SIGN			-	W1	
-	Sign of wear			BOOLEAN	Immediately	
-						
-	-	FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE...	0	-	7/7	U

Description:

TRUE:

The sign for wear of the tool length components and the tool radius are inverted, i.e. if a positive value is entered, the total dimension is decreased.

FALSE:

The sign for wear of the tool length components and the tool radius is not inverted.

42935	WEAR_TRANSFORM	-	W1, W4
-	Transformations for tool components	UDWORD	Immediately
-			
-	-	0, 0, 0, 0, 0, 0, 0, 0...	0x0 0x03 7/7 U

Description:

This setting data is bit-coded.

It determines which of the three wear components wear

(\$TC_DP12 - \$TC_DP14),

additive offsets fine (\$TC_SCPx3 - \$TC_SCPx5),

and additive offsets coarse (\$TC_ECPx3 - \$TC_ECPx5)

are subject to adapter transformation and transformation by an orientable tool holder, if one of the two G codes TOWMCS or TOWWCS from G code group 56 is active. If initial-setting G code TOWSTD is active, this setting data will not become active.

Then, the following assignment is valid:

Bit 0 = TRUE: Do not apply transformations to \$TC_DP12 - \$TC_DP14.

Bit 1 = TRUE: Do not apply transformations to \$TC_SCPx3 - \$TC_SCPx5.

Bit 2 = TRUE: Do not apply transformations to \$TC_ECPx3 - \$TC_ECPx5.

The bits not mentioned here are (currently) not assigned.

42940	TOOL_LENGTH_CONST	-	W1
-	Change of tool length components with change of active plane	DWORD	Immediately
-			
-	-	0, 0, 0, 0, 0, 0, 0, 0...	- - 7/7 U

Description:

If this setting data is not equal to 0, the assignment of tool length components (length, wear, base dimensions) to geometry axes is not changed when the machining plane (G17 - G19) is changed.

The assignment of tool length components to geometry axes can be derived from the value of the setting data according to the following tables.

The assignment of the tool orientation components is not affected by this setting data. Setting data SD42945 \$SC_TOOL_ORI_CONST_M and SD42947 \$SC_TOOL_ORI_CONST_T may have to be set accordingly.

A distinction is made between turning and grinding tools (tool types 400 to 599) and other tools (typically milling tools) in the assignment.

Representation of this information in tables assumes that geometry axes 1 to 3 are called X, Y and Z. For assignment of an offset to an axis, not the axis identifier but the axis sequence is relevant.

Assignment for turning tools and grinding tools (tool types 400 to 599):

Content Length 1 Length 2 Length 3

17 Y X Z

18* X Z Y

19 Z Y X

-17 X Y Z

-18 Z X Y

-19 Y Z X

* Any value which is not 0 and is not one of the six values listed, is treated as value 18.

2.4 NC setting data

For values that are the same but with a different sign, assignment of length 3 is always the same, lengths 1 and 2 are reversed. Assignment for all tools which are neither turning nor grinding tools (tool types < 400 or > 599):

Content	Length 1	Length 2	Length 3
17*	Z	Y	X
18	Y	X	Z
19	X	Z	Y
-17	Z	X	Y
-18	Y	Z	X
-19	X	Y	Z

* Any value which is not 0 and is not one of the six values listed, is treated as value 17.

For values that are the same but with a different sign, assignment of length 1 is always the same, lengths 2 and 3 are reversed.

If the 100s digit of the settings data is 1, the sign of the second length component is inverted.

If the setting data SD42950 \$SC_TOOL_LENGTH_TYPE has the value 3, this setting data is only active with milling tools. Together with setting data SD42942

\$SC_TOOL_LENGTH_CONST_T, the length assignments can then be set separately for turning and milling tools.

42942	TOOL_LENGTH_CONST_T			-	W1	
-	Change tool length components for turning tools with change of active plane			DWORD	Immediately	
-						
-	-	0, 0, 0, 0, 0, 0, 0, 0...	-	-	7/7	U

Description:

This setting data is only evaluated if SD42950 \$SC_TOOL_LENGTH_TYPE has the value 3. Under this condition, it has the following meaning:

If this setting data is not equal to zero, the assignment of the tool length components (length, wear and base dimensions) of turning and grinding tools (tool types 400 to 599) to geometry axes is not changed when the machining plane (G17 - G19) is changed.

The assignment of tool orientation components is not affected by this setting data. Setting data SD42957 \$SC_TOOL_ORI_CONST_T may have to be set correspondingly.

The assignment of tool orientation components to the geometry results from the value of the setting data according to the following table.

The representation of this information in tables assumes that geometry axes 1 to 3 are called X, Y and Z. For assignment of an offset to an axis, not the axis identifier but the axis sequence is relevant.

Content	Length 1	Length 2	Length 3
17	Y	X	Z
18*	X	Z	Y
19	Z	Y	X
-17	X	Y	Z
-18	Z	X	Y
-19	Y	Z	X

* Any value which is not 0 and is not one of the six values listed, is evaluated as value 18.

For values that are the same but with a different sign, assignment of length 3 is always the same, lengths 1 and 2 are reversed.

If the 100s digit of the settings data is 1, the sign of the second length component is inverted.

42950	TOOL_LENGTH_TYPE	-	W1
-	Assignment of tool length compensation independent of tool type	DWORD	Immediately
-			
-	-	0, 0, 0, 0, 0, 0, 0, 0...	- - 7/7 U

Description: This setting data defines the assignment of the tool length components to the geometry axes irrespective of the tool type. It can assume any value between 0 and 3. Any other value is interpreted as 0.

Value

0: Standard assignment. A distinction is made between turning and grinding tools (tool types 400 to 599) and other tools (milling tools).

1: The tool length components are assigned irrespective of the actual tool type, always as for milling tools.

2: The tool length components are assigned irrespective of the actual tool type, always as for turning and grinding tools.

3: The tool length components are assigned separately, on the one hand for turning and grinding tools (tool types 400 to 599) and, on the other hand, for all other tools (milling tools).

The assignment of tool components is specified as follows:

Milling tools:

The assignment of tool length components is specified by SD42940
\$SC_TOOL_LENGTH_CONST.

Turning and grinding tools:

The assignment of tool length components is specified by SD42942
\$SC_TOOL_LENGTH_CONST_T.

The setting data also affects the wear values assigned to the length components.

If SD42940 \$SC_TOOL_LENGTH_CONST is set, the tables defined there access the table for milling and turning tools defined by SD42950 \$SC_TOOL_LENGTH_TYPE irrespective of the actual tool type if the value of the latter is 1 or 2.

42954	TOOL_ORI_CONST_M	-	W1
-	Change of the tool orientation component for milling tools on plane change	DWORD	Immediately
-			
-	-	0, 0, 0, 0, 0, 0, 0, 0...	- - 7/7 U

Description: If this setting data is not equal to zero, a clockwise, orthogonal tool coordinate system is defined for milling tools (all tool types except 400 to 599), which remains unchanged when the machining plane is changed (G17 - G19). It has no relevance for turning and grinding tools.

The orientation coordinate system is determined by the orientation vector and a normal orientation vector extending perpendicularly to it. It is completed by a third vector, the binormal vector, which derives from the cross product of the normal orientation vector and the orientation vector.

The basic orientation is determined by the units and tens digits of the setting data. Apart from the value 0, only the values 17, 18 and 19 are permissible. All other values are treated as if their value were 17.

	Orientation vector	Normal orient- ation vector	Binormal vector
17*	(0, 0, 1)	(0, 1, 0)	(1, 0, 0)
18	(0, 1, 0)	(1, 0, 0)	(0, 0, 1)
19	(1, 0, 0)	(0, 0, 1)	(0, 1, 0)

* Each value not equal to 0 that is not one of the listed values is evaluated as if it were the value 17.

2.4 NC setting data

If n is the content of the 100s digit of the setting data, the coordinate system is rotated around the orientation vector by the angle $n * 90$ degrees. n may have the values 0 to 3. Larger values are evaluated as if they were 0.

If the sign of the setting data is negative, the coordinate system is rotated around the axis by 180 degrees, which is defined by the original position of the normal orientation vector (that is, before any rotation due to n being unequal to 0).

Example:

If the content of the setting data is -18, then:

Orientation vector (0, -1, 0)

Normal orientation vector (1, 0, 0)

Binormal vector (0, 0, -1)

Handling of tools with an explicitly programmed tool orientation by means of cutting edge data (\$TC_DPV..):

This setting data is normally ignored for tools for which the orientation is defined in this way. This means that the programmed orientation vectors are assigned to the geometry axes in response to the active machining plane (G17 - G19).

If the setting data is also active for such tools, the 1000s digit must be equal to 1. However, the 100s digit and the sign are not evaluated. This means that the setting data only defines how the orientation components are assigned to the geometry axis directions. No additional rotations are performed.

42956	TOOL_ORI_CONST_T	-	W1
-	Change in the tool orientation component for turning tools on plane change	DWORD	Immediately
-			
-	-	0, 0, 0, 0, 0, 0, 0, 0...	- - 7/7 U

Description:

If this setting data is not equal to zero, the assignment of the tool orientation components of turning and grinding tools (tool types 400 to 599) to the geometry axes is not changed if the machining plane changes (G17 - G19). It has no relevance for tools other than turning and grinding tools.

The orientation coordinate system is determined by the orientation vector and a normal orientation vector lying at right-angles to it. It is completed by a third vector, the binormal vector, which is given by the cross product of the normal orientation vector and the orientation vector.

The basic orientation is determined by the units and tens digits of the setting data. Apart from the value 0, only the values 17, 18 and 19 are permissible. All other values are treated as if their value were 18.

Content	Orientation vector	Normal orientation vector	Binormal vector
17	(0, 0, 1)	(0, 1, 0)	(1, 0, 0)
18*	(0, 1, 0)	(1, 0, 0)	(0, 0, 1)
19	(1, 0, 0)	(0, 0, 1)	(0, 1, 0)

* Each value not equal to 0, which is not one of the listed values is evaluated as if it were the value 18.

If n is the content of the 100s digit of the setting data, the coordinate system is rotated around the orientation vector by the angle $n * 90$ degrees. n may have the values 0 to 3. Larger values are evaluated as if they were 0.

If the sign of the setting data is negative, the coordinate system is rotated around the axis by 180 degrees, which is defined by the original position of the normal orientation vector (that is before any rotation on account of n being unequal to 0).

Example:

If the content of the setting data is -18, then:

Orientation vector (0, -1, 0)

Normal orientation vector (1, 0, 0)

Binormal vector (0 , 0, -1)

Handling of tools with an explicitly programmed tool orientation by using cutting edge data (\$TC_DPV..):

This setting data is normally ignored for tools for which the orientation is defined in this way. This means that the programmed orientation vectors are assigned to the geometry axes according to the active machining plane (G17 - G19).

If the setting data is also active for such tools, then the 1000s digit must be equal to 1. However, the 100s digit and the sign are not evaluated. This means that the setting data only defines how the orientation components are assigned to the geometry axis directions. No additional rotations are executed.

42960	TOOL_TEMP_COMP			-	W1	
-	Temperature compensation for tool			DOUBLE	Immediately	
-						
-	3	0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0,...	-MD_DBLMAX	1.0E+301	7/7	U

Description: Temperature compensation value for the tool. The compensation value acts as vector according to the current rotation of the tool direction.

This setting data will only be evaluated, if temperature compensation has been activated for tools with MD20390 \$MC_TOOL_TEMP_COMP_ON.

Apart from that, the temperature compensation type must be set in bit 2 for the "Compensation in tool direction" MD32750 \$MA_TEP_COMP_TYPE.

The "Temperature compensation" is an option that has to be previously enabled.

42970	TOFF_LIMIT			-	F2	
mm	Upper limit of correction value via \$AA_TOFF			DOUBLE	Immediately	
-						
-	3	10.0, 10.0, 10.0, 10.0, 10.0, 10.0, 10.0, 10.0, 10.0, 10.0, 10.0...	0.0	1.0E+301	7/7	U

Description: Upper limit of the offset value which can be defined by means of synchronized actions via the \$AA_TOFF system variable.

This limit value influences the absolutely effective amount of offset through \$AA_TOFF.

Whether the offset value is within the limit range can be checked via the \$AA_TOFF_LIMIT system variable.

42972	TOFF_LIMIT_MINUS			-	F2	
mm	Lower limit of the offset value \$AA_TOFF			DOUBLE	Immediately	
-						
-	3	0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0, 0.0,...	-MD_DBLMAX	0.0	7/7	U

Description: Lower limit of the offset value which can be specified through synchronous actions via the system variable \$AA_TOFF.

This limit value acts on the active correction through \$AA_TOFF in the minus direction.

This limit value is only effective if \$MC_TOFF_MODE Bit6 = 1 is set.

Whether the offset value is within the limit range can be checked via the \$AA_TOFF_LIMIT system variable.

2.4 NC setting data

42974	TOCARR_FINE_CORRECTION			C08	-	
-	Fine offset TCARR ON / OFF			BOOLEAN	Immediately	
-						
-	-	FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE...	0	-	7/7	U

Description: TRUE:
On activating an orientable tool holder, the fine offset values are considered.

FALSE:
On activating an orientable tool holder, the fine offset are not considered.

42977	SLOT_FORM_RECOGN			-	-	
-	Slot recognition on/off			BOOLEAN	Immediately	
-						
-	-	FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE, FALSE...	0	-	7/7	U

Description: TRUE:
With active tool radius compensation, narrow slots are detected and traversed.

FALSE:
With active tool radius compensation, narrow slots are ignored

42980	TOFRAME_MODE			-	K2	
-	Frame definition at TOFRAME, TOROT and PAROT			DWORD	Immediately	
-						
-	-	1000, 1000, 1000, 1000, 1000, 1000, 1000, 1000...	-	-	7/7	U

Description: This setting data defines the direction of the geometry axes on the machining plane (XY in the case of G17) in the case of the frame definition by means of (TOROTY, TOROTX) or for PAROT.

When a frame is calculated, the tool direction (Z in the case of G17) is uniquely defined so that the tool direction and vertical axis (Z in the case of G17) of the frame are parallel and lie perpendicular on the machining plane.

Rotation around the tool axis is free at first. This free rotation can be defined using this setting data so that the newly defined frame deviates as little as possible from a previously active frame.

In all cases in which the setting data is not zero, an active frame remains unchanged if the tool direction (Z in the case of G17) of the old and the new frame are the same.

SD42980 \$SC_TOFRAME_MODE >= 2000:

In the case of TOROT (or TOROTY and TOROTX), the rotations and translations of the frame chain are used to calculate a frame in the tool reference system frame (\$P_TOOLFRAME) berechnet.

Machine data 21110 \$MC_X_AXIS_IN_OLD_X_Z_PLANE is not evaluated.

The explanatory notes below refer to the G17 plane with the XY axes in the machining plane and the tool axis being Z.

SD42980 \$SC_TOFRAME_MODE = 2000:

Rotation around the Z axis is selected so that the angle between the new X axis and the old X-Z plane has the same absolute value as the angle between the new Y axis and the old Y-Z plane. This setting corresponds to the mean value of both settings which would result for values 2001 and 2002 of this setting data.

It is also applied if the value of the units digit is greater than 2.

SD42980 \$SC_TOFRAME_MODE = 2001:

The new X direction is selected so that it lies in the X-Z plane of the old coordinate system. The angular difference between the old and new Y axes is minimal with this setting.

SD42980 \$SC_TOFRAME_MODE = 2002:

The new Y direction is selected so that it lies in the Y-Z plane of the old coordinate system. The angular difference between the old and new X axes is minimal with this setting.

None of the other settings of SD42980 \$SC_TOFRAME_MODE (0,1,2,...1000,1001..) should be used for recommissioning.

For compatibility reasons, the following settings remain valid:

0: The orientation of the coordinate system is determined by the value of machine data 21110 \$MC_X_AXIS_IN_OLD_X_Z_PLANE.

1: The new X direction is selected so that it lies in the X-Z plane of the old coordinate system. The angular difference between the old and new Y axes is minimal with this setting.

2: The new Y direction is selected so that it lies in the Y-Z plane of the old coordinate system. The angular difference between the old and new X axes is minimal with this setting.

3: The average of the two settings resulting from 1 and 2 is selected.

Addition of 100: In the case of a plane change from G17 to G18 or G19, a tool matrix is generated, in which the new axis directions are parallel to the old directions. The axes are swapped cyclically accordingly (standard transformation on plane changes). If the hundreds digit equals zero, a matrix is supplied in the cases of G18 and G19 which is derived from the unit matrix by simply rotating through 90 degrees around the X axis (G18) or through 90 degrees around the Y axis (G19). Thus in each case one axis is antiparallel to an initial axis. This setting is required to remain compatible with old software versions.

Addition of 1000: The tool-frame is linked to any active basic frames and settable frames. The response is thus compatible with earlier software versions (before 5.3). If the thousands digit is not set, the tool frame is calculated so that any active basic frames and settable frames are taken into account.

42984	CUTDIRMOD	C08	-
-	Modification of \$P_AD[2] or \$P_AD[11]	STRING	Immediately
-			
-	-	-	-
		7/7	U

Description:

States whether the tool point direction and cutting direction are to be modified on reading the corresponding system variables \$P_AD[2] and \$P_AD[11].

Modification is made by rotating the vector of the tool point direction or cutting direction by a specific angle in the active machining plane (G17-G19). The resulting output value is always the tool point direction or cutting direction created by the rotation or to which the rotated value is closest. the angle of rotation can be defined by one of the following six options:

- 1: The string is empty. The stated data are output unchanged.
- 2: The contents of the string is "P_TOTFRAME". The resulting rotation is determined from the total frame.
- 3: The contents of the string is a valid frame name (e.g. \$P_NCBFRAME[3]). The resulting rotation is then calculated from this frame.

2.4 NC setting data

4: The contents of the string has the form "Frame1 : Frame2". The resulting rotation is determined from the part frame chain that is created by chaining all frames from Frame1 to Frame2 (in each case inclusive). Frame1 and Frame2 are valid frame names such as \$P_PFRAME or \$P_CHBFRAME[5]"

5: The contents of the frame is the valid name of a rotary axis (machine axis). The resulting rotation is determined from the programmed end position of this rotary axis. Additionally, an offset can be stated (in degrees, e.g. "A+90").

6: The rotation is programmed explicitly (in degrees).

Optionally, the first character of the string can be written as sign (+ or -). A plus sign will not have any effect on the angle calculation, but a minus sign will invert the sign of the calculated angle.

42990	MAX_BLOCKS_IN_IPOBUFFER	-	K1
-	Maximum number of blocks in IPO buffer	DWORD	Immediately
-			
-	-	-1, -1, -1, -1, -1, -1, -1, -1...	-
-	-	-	7/7
-	-	-	U

Description:

This setting data can be used to limit the maximum number of blocks in the interpolation buffer to the maximum number specified in MD28060 \$MC_MM_IPO_BUFFER_SIZE.

A negative value means that no limitation of the number of blocks is active in the interpolation buffer, and the number of blocks is determined solely by MD28060 \$MC_MM_IPO_BUFFER_SIZE (default setting).

42995	CONE_ANGLE	-	-
-	Taper angle	DOUBLE	Immediately
-			
-	-	-	-90
-	-	-	90
-	-	-	7/7
-	-	-	U

Description:

This setting data writes the taper angle for taper turning. This setting data is written via the operator interface.

42996	JOG_GEOAX_MODE_MASK	-	-
-	JOG of geometry axis mode	DWORD	Immediately
-			
-	-	0, 0, 0, 0, 0, 0, 0, 0...	0
-	-	0	0x7
-	-	0	7/7
-	-	0	U

Description:

This setting data sets the following during JOG of geometry axes:

Bit 0 = 1 :

A traversing request for the 1st geometry axis is inverted, i.e. a traversing request to + triggers a traversing motion to - .

Bit 1 = 1 :

A traversing request for the 2nd geometry axis is inverted, i.e. a traversing request to + triggers a traversing motion to - .

Bit 2 = 1:

A traversing request for the 3rd geometry axis is inverted, i.e. a traversing request to + triggers a traversing motion to - .

42998	CUTMOD_PLANE_TOL	-	-
degrees	Deviation tool tip/machining plane	DOUBLE	Immediately
-			
-	-	5.0, 5.0, 5.0, 5.0, 5.0, 5.0, 5.0, 5.0...	0.0
-	-	5.0, 5.0, 5.0...	89.0
-	-	5.0, 5.0, 5.0...	7/3
-	-	5.0, 5.0, 5.0...	U

Description:

This setting data specifies by how many degrees the tip of a tool can be rotated as a maximum from the machining plane when calling the CUTMOD or CUTMODK function, i.e. the maximum deviation of the angle gamma from one of the two standard positions 0 or 180 degrees.

If the value of this setting data is 0, the absolute value of the specified angle is a maximum of 89 degrees.

42999	ORISOLH_INCLINE_TOL			-	-	
degrees	Deviation, tool tip/machining plane for ORISOLH			DOUBLE	Immediately	
-						
-	-	1.0, 1.0, 1.0, 1.0, 1.0, 1.0, 1.0, 1.0...	0.001	89.0	7/3	U

Description:

This setting data specifies the maximum permissible inclination of the tool tip with respect to the machining plane (in the standard case G18) when calling the ORISOLH function for "Directly swivel tool".

43100	LEAD_TYPE			-	M3	
-	Defines what is used as master value			DWORD	Immediately	
CTEQ						
-	-	1	0	2	7/7	U

Description:

Defines which value is to be used as master value:

0: Actual value

1: Setpoint

2: Simulated master value

43102	LEAD_OFFSET_IN_POS			-	M3	
-	Offset of master value if coupled to this axis			DOUBLE	Immediately	
-						
-	-	0.0	-1e15	1e15	7/7	U

Description:

Offset of the master value before use on the coupling.

If this axis is a master value coupled following axis with CTABP as the curve table and X as the master value, then its position setpoint is calculated from

$$\text{LEAD_OFFSET_OUT_POS} + \text{LEAD_SCALE_OUT_POS} * \text{CTABP}(\text{LEAD_OFFSET_IN_POS} + \text{LEAD_SCALE_IN_POS} * X)$$

43206	SPIND_SPEED_TYPE	A06	-
-	Spindle speed type for spindle start through VDI	DWORD	Immediately
-			
-	-	94	93
		973	7/7
			U

Description:

Definition of the spindle speed type for the master spindle.

The range of values and the functionality correspond to the 15th G group "feed type".

Permissible values are the G values: 93, 94, 95, 96, 961, 97, 971 and 973.

The stated values make a functional distinction between the following variants:

==> 93, 94, 95, 97 and 971: The spindle is started at the speed in SD 43200 \$SA_SPIND_S.

==> 96 and 961: The speed of the spindle is derived from the cutting speed of SD 43202 \$SA_SPIND_CONSTCUT_S and the radius of the transverse axis.

==> 973: G973 behaves like G97, but the spindle speed limitation is not active

The default value is 94 (corresponds to G94)

The default value becomes active if the SD is written with impermissible values.

43210	SPIND_MIN_VELO_G25	-	S1
rev/min	Programmed spindle speed limitation G25	DOUBLE	Immediately
-			
-	-	0.0	0.0
		1.0E+301	7/7
			U

Description:

A minimum spindle speed limit below which the spindle must not fall is entered in SPIND_MIN_VELO_G25. The NCK limits the set spindle speed to this value if it is too low.

The spindle speed may only fall below the minimum as a result of:

2.4 NC setting data

- Spindle offset 0%
- M5
- S0
- NC/PLC interface signal DB31, ... DBX4.3 (Spindle stop)
- NC/PLC interface signal DB31, ... DBX2.1 (Servo enable)
- NC/PLC interface signal DB21-30 DBX35.7 (Channel status: Reset)
- NC/PLC interface signal DB31, ... DBX2.2 (Delete distance-to-go/Spindle reset)
- NC/PLC interface signal DB31, ... DBX18.5 (Oscillation speed)

rev/min	Maximum spindle speed			DOUBLE	Immediately	
-						
-	-	1.0e+8	0.0	1.0E+301	7/7	U

Description: The user can enter a maximum spindle speed.
The NCK limits an excessive spindle setpoint speed to this value. The SD is effective immediately.
Corresponds with:
MD35100 \$MA_SPIND_VELO_LIMIT (maximum spindle speed)
MD35110 \$MA_GEAR_STEP_MAX_VELO (maximum speed for gear stage change)

43240	M19_SPOS			, A12	S1	
degrees	Spindle position for spindle positioning with M19.			DOUBLE	Immediately	
-						
-	-	0.0	-10000000.0	10000000.0	7/7	U

Description: Spindle position in [DEGREES] for spindle positioning with M19.
The position approach mode is defined in SD43250 \$SA_M19_SPOSMODE.
Default positions must lie in the range $0 \leq \text{pos} < \text{MD30330 } \MA_MODULO_RANGE .
Path defaults (SD43250 \$SA_M19_SPOSMODE = 2) can be positive or negative and are only limited by the input format.

43250	M19_SPOSMODE			, A12	S1	
-	Spindle position approach mode for spindle positioning with M19.			DWORD	Immediately	
-						
-	-	0	0	5	7/7	U

Description: Spindle position approach mode for spindle positioning with M19.
In which signify:
0: DC (default) approach position on the shortest path.
1: AC approach position normally.
2: IC approach incrementally (as path), sign gives the traversing direction
3: DC approach position on the shortest path.
4: ACP approach position from the positive direction.
5: ACN approach position from the negative direction.

43300	ASSIGN_FEED_PER_REV_SOURCE			-	V1, P2, S1	
-	Revolutional feedrate for positioning axes/spindles			DWORD	Immediately	
CTEQ						
-	-	0	-3	31	7/7	U

Description: 0= No revolutional feedrate is active.
>0= Machine axis index of the rotary axis/spindle, from which the revolutional feedrate is derived.
-1= The revolutional feedrate is derived from the master spindle of the channel in which the axis/spindle is active
-2= The revolutional feedrate is derived from the axis with machine axis index == 0 or the axis with an index in MD10002 \$MN_AXCONF_LOGIC_MACHAX_TAB == 0.
-3= The revolutional feedrate is derived from the master spindle of the channel in which the axis/spindle is active. No revolutional feedrate is active if the master spindle is at a standstill.

MD10710 \$MN_PROG_SD_RESET_SAVE_TAB

43320	JOG_POSITION	-	-
mm, degrees	JOG position	DOUBLE	Immediately
-			
-	-	0.0	-MD_DBLMAX 1.0E+301 7/7 U

Description: Position to be approached in JOG. Depending on MD10735 \$MN_JOG_MODE_MASK bit 4 axial frames and, with an axis configured as geometry axis, the tool length offset are considered.

43340	EXTERN_REF_POSITION_G30_1	, A12	FBFA
-	Reference point position for G30.1	DOUBLE	Immediately
-			
-	-	0.0	-MD_DBLMAX 1.0E+301 7/7 U

Description: Reference point position for G30.1.
This setting data will be evaluated in CYCLE328.

43350	AA_OFF_LIMIT	-	S5, FBSY
mm, degrees	Upper limit of offset value \$AA_OFF with clearance control	DOUBLE	PowerOn
CTEQ			
-	-	100000000.0	0.0 1e15 7/7 U

Description: The upper limit of the offset value, which can be defined by means of synchronized actions via the variable \$AA_OFF.
This limit value acts on the absolutely effective amount of offset by means of \$AA_OFF.
It is used for clearance control in laser machining:
The offset value is limited so that the laser head cannot get caught in the plate recesses.
Whether the offset value lies within the limit range can be queried via system variable \$AA_OFF_LIMIT.

43400	WORKAREA_PLUS_ENABLE	-	A3
-	Working area limitation active in positive direction	BOOLEAN	Immediately
CTEQ			
-	-	FALSE	0 - 7/7 U

Description: 1: The working area limitation of the axis concerned is active in the positive direction.
0: The working area limitation of the axis concerned is switched off in the positive direction.
The setting data is parameterized via the operator panel in the operating area "Parameters" by activating/deactivating the working area limitation.
SD irrelevant for
G code: WALIMOF

43410	WORKAREA_MINUS_ENABLE	-	A3
-	Working area limitation active in the negative direction	BOOLEAN	Immediately
CTEQ			
-	-	FALSE	0 - 7/7 U

Description:

1: The working area limitation of the axis concerned is active in the negative direction.

0: The working area limitation of the axis concerned is switched off in the negative direction.

The setting data is parameterized via the operator panel in the operating area "Parameters" by activating/deactivating the working area limitation.

SD irrelevant for

G code: WALIMOF

43420	WORKAREA_LIMIT_PLUS	-	A3
mm, degrees	Working area limitation plus	DOUBLE	Immediately
-			
-	-	1.0e+8	-MD_DBLMAX 1.0E+301 7/7 U

Description:

The working area defined in the basic coordinate system in the positive direction of the axis concerned can be limited with axial working area limitation.

The setting data can be changed on the operator panel in the operating area "Parameters".

The positive working area limitation can be changed in the program with G26.

43500	FIXED_STOP_SWITCH	-	F1
-	Selection of travel to fixed stop	BYTE	Immediately
-			
-	-	0 0 1	7/7 U

Description:

The "Travel to fixed stop" function can be selected and deselected with this setting data.

SD=0 Deselect "Travel to fixed stop"

SD=1 Select "Travel to fixed stop"

The setting data can only be overwritten by the part program with the command FXS[x]=1/0 when software version 2.x is installed.

2.4 NC setting data

The status of the setting data is indicated on the operator panel in the "Parameters" area.

43510	FIXED_STOP_TORQUE			-	F1	
%	Fixed stop clamping torque			DOUBLE	Immediately	
-						
-	-	5.0	0.0	800.0	7/7	U

Description:

The clamping torque is entered in this setting data as a % of the maximum motor torque (corresponds to % of max. current value with FDD).

The setting data is active only if the fixed stop has been reached.

The fixed stop is considered reached when,

- with MD37060 \$MA_FIXED_STOP_ACKN_MASK, bit 1 = 0 (no acknowledgment required), the interface signal DB31, ... DBX62.5 (Fixed stop reached) is set by the NC
- with MD37060 \$MA_FIXED_STOP_ACKN_MASK, bit 1 = 1 (acknowledgment required), the interface signal DB31, ... DBX62.5 (Fixed stop reached) is set by the NC and acknowledged by interface signal DB31, ... DBX1.1 (Acknowledge fixed stop reached)

The status of the setting data is indicated on the operator panel in the "Parameters" area.

The FXST[x] command effects a block-synchronous change to this setting data. It can also be changed by the user or via the PLC. Otherwise the value is transferred from MD37010 \$MA_FIXED_STOP_TORQUE_DEF to the setting data when "Travel to fixed stop" is active.

Related to

MD37010 \$MA_FIXED_STOP_TORQUE_DEF (default setting for clamping torque)

43520	FIXED_STOP_WINDOW			-	F1	
mm, degrees	Fixed stop monitoring window			DOUBLE	Immediately	
-						
-	-	1.0	0.0	1.0E+301	7/7	U

Description:

The fixed stop monitoring window is entered in this setting data.

The setting data is active only if the fixed stop has been reached.

The fixed stop is considered reached when,

- with MD37060 \$MA_FIXED_STOP_ACKN_MASK, bit 1 = 0 (no acknowledgment required) interface signal DB31, ... DBX62.5 (Fixed stop reached) is set by the NC
- with MD37060 \$MA_FIXED_STOP_ACKN_MASK, bit 1 = 1 (acknowledgment required) interface signal DB31, ... DBX62.5 (Fixed stop reached) is set by the NC and acknowledged by interface signal DB31, ... DBX1.1 (Acknowledge fixed stop reached)

If the position at which the fixed stop was detected leaves the tolerance band by more than the amount specified in SD43520 \$SA_FIXED_STOP_WINDOW, then alarm 20093 "Fixed stop monitoring has responded" is output and the "FXS" function is deselected.

The status of the setting data is indicated on the operator panel in the "Parameters" area.

The FXSW[x] command effects a block-synchronous change to this setting data. It can also be changed by the user or via the PLC.

The value is otherwise transferred from MD37020 \$MA_FIXED_STOP_WINDOW_DEF to the setting data when "Travel to fixed stop" is active.

Related to

MD37020 \$MA_FIXED_STOP_WINDOW_DEF (default setting for fixed stop monitoring window)

43600	IPOBRAKE_BLOCK_EXCHANGE			A06, A10	K1	
%	Block change criterion 'braking ramp'			DOUBLE	Immediately	
-						
-	-	0.0	0	100.0	7/7	U

Description: Specifies the application time at single axis interpolation for the block change criterion braking ramp: At 100%, the block change criterion is fulfilled at the time of application of the braking ramp. At 0%, the block change criterion is identical with IPOENDA.

Note:

MD10710 \$MN_PROG_SD_RESET_SAVE_TAB can be set so that the value written by the part program is transferred into the active file system on reset (i.e. the value is retained even after reset).

43610	ADISPOSA_VALUE	A06, A10	P2
mm, degrees	Tolerance window 'braking ramp'	DOUBLE	Immediately
-			
-	-	0.0	0.0
		1.0E+301	7/7
			U

Description: In case of single-axis interpolation, this value defines the size of the tolerance window which the axis must have reached in order to enable a block change in case of the block-change criterion 'braking ramp with tolerance window valid' and when reaching the corresponding % value of the braking ramp (SD43600 \$SA_IPOBRAKE_BLOCK_EXCHANGE).

Note:

By means of the MD 10710 \$MN_PROG_SD_RESET_SAVE_TAB, the user can specify that the value written by the part program is transferred into the active file system in case of a reset (i.e. the value is retained even after the reset).

43700	OSCILL_REVERSE_POS1	-	P5
mm, degrees	Oscillation reversal point 1	DOUBLE	Immediately
-			
-	-	0.0	-MD_DBLMAX
		1.0E+301	7/7
			U

Description: Position of the oscillating axis at reversal point 1.

Note:

MD10710 \$MN_PROG_SD_RESET_SAVE_TAB can be set so that the value written by the part program is transferred to the active file system on reset (that is the value is retained after RESET.)

-						
-	-	100	0	255	4/3	M

Description: Maximum value of the permissible spindle power as a percentage; the display bar in the machine image "spindle diagnosis" is shown green in the range between 0 and the value set in SPIND_MAX_POWER.

In the case of a SINAMICS drive, the drive parameter r0033 "Torque utilization smoothed" is shown in the load bar.

51031	SPIND_POWER_RANGE	-	-			
%	Display range of spindle power rating display	DWORD	PowerOn			
-						
-	-	100	0	255	4/3	M

Description: Scale end value for spindle power rating in percent; value must be equal to or greater than SPIND_MAX_POWER.

The display bar in the machine image is shown in red in the range between the values of SPIND_MAX_POWER and SPIND_POWER_RANGE.

51034	TEACH_MODE	-	-			
-	Teach mode to be activated	DWORD	PowerOn			
-						
-	-	1	-	-	4/3	M

Description: Teach mode to be activated

Bit 0: default teach-in

Taught-in block is transferred to the program using the Accept softkey.

Bit 1: transfer of teach block can be blocked by the PLC.

SINUMERIK 840D sl:

DB19.DBX13.0 = 0 block is transferred.

DB19.DBX13.0 = 1 block is not transferred.

SINUMERIK 828D:

DB1700.DBX1000.0 = 0 block is transferred.

DB1700.DBX1000.0 = 1 block is not transferred.

Bit 2: block selection only explicitly

Bits 16-31 are reserved for the OEM.

51035	WRITE_FRAMES_FINE_LIMIT	-	-			
-	Input limit for all WO fine	DOUBLE	PowerOn			
-						
-	-	0.999	-	-	4/3	M

Description: Input limit for all work offsets fine

51036	ENABLE_COORDINATE_REL	-	-
-	Enable REL coordinate system	BYTE	PowerOn
-			
-	-	0	0
-	-	1	7/3
-	-	0	M

Description: Display REL coordinate system
 0 = No relative coordinate system selectable
 1 = REL coordinate system can be selected as an alternative to the Work (WCS)/SZS coordinate system

51037	ENABLE_COORDINATE_ACS	-	-
-	Enable settable coordinate system	BYTE	PowerOn
-			
-	-	0	0
-	-	1	7/3
-	-	0	M

Description: Activate settable coordinate system
 0 = WCS coordinate system is displayed
 1 = SZS coordinate system is displayed
 (SZS is WCS reduced by the offset components defined in MD24030)

51038	SET_ACT_VALUE	-	-
-	Set actual value selection	BYTE	PowerOn
-			
-	-	1	0
-	-	1	7/3
-	-	0	M

Description: Set actual value selection
 0 = Set actual value is not offered.
 1 = if a user frame (settable work offset e.g. G54) is active, it will be used. In G500 Set actual values is not offered (system frame is no longer used).

51039	PROGRAM_CONTROL_MODE_MASK	-	-
-	Options for machine - program influence	DWORD	PowerOn
-			
-	-	1	-
-	-	-	7/3
-	-	-	M

Description: Options for machine - program influence:
 Bit 0: program test function available

51040	SWITCH_TO_MACHINE_MASK	-	-
-	Automatic operating area switchover to machine	BYTE	PowerOn
-			
-	-	0	-
-	-	-	7/3
-	-	-	M

Description: Automatic area switchover dependent upon machine
 Bit 0: No automatic switch to Machine operating area when the program is selected in the Program Manager.
 Bit 1: No automatic switch to Machine operating area when the operating mode is changed over via the machine control panel (MCP).
 Bit 2: No automatic switch to Machine operating area when the program is selected in the Programs operating area.
 Bit 3: No automatic start of block search when the program is selected / executed in the Programs operating area.

2.5 Machine and setting data cycles

51041	ENABLE_PROGLIST_USER	-	-
-	Activation of PLC program list, USER area	BYTE	Immediately
-			
-	-	0	0
-	-	1	7/3
-	-	M	

Description: Activates the PLC program list of the USER area. The programs entered there can be selected by the PLC for processing.

51042	ENABLE_PROGLIST_INDIVIDUAL	-	-
-	Activation of PLC program list, INDIVIDUAL area	BYTE	Immediately
-			
-	-	0	0
-	-	1	7/3
-	-	M	

Description: Activates the PLC program list of the INDIVIDUAL area. The programs entered here can be selected by the PLC for processing.

51043	ENABLE_PROGLIST_MANUFACT	-	-
-	Activation of PLC program list, MANUFACTURER area	BYTE	Immediately
-			
-	-	0	0
-	-	1	7/3
-	-	M	

Description: Activates the PLC program list of the MANUFACTURER area. The programs entered here can be selected by the PLC for processing.

51044	ACCESS_SHOW_SBL2	-	-
-	Display protection level SBL2	BYTE	PowerOn
-			
-	-	7	0
-	-	7	4/3
-	-	M	

Description: Display protection level SBL2

51045	ACCESS_TEACH_IN	-	-
-	Protection level TEACH IN	BYTE	PowerOn
-			
-	-	4	0
-	-	7	4/3
-	-	M	

Description: Protection level TEACH IN

51046	ACCESS_CLEAR_RPA	-	-
-	Protection level delete R variables	BYTE	PowerOn
-			
-	-	4	0
-	-	7	4/3
-	-	M	

Description: Protection level delete R variables

51047	ACCESS_READ_GUD_LUD	-	-
-	Read user variable protection level	BYTE	PowerOn
-			
-	-	7	0
-	-	7	4/3
-	-	M	

Description: Read user variable protection level

51048	ACCESS_WRITE_GUD_LUD	-	-
-	Write protection level of user variables	BYTE	PowerOn
-			
-	-	7	0
-	-	7	4/3
-	-	-	M

Description: Write protection level of user variables

51049	ACCESS_WRITE_PRG_COND	-	-
-	Write program control protection level	BYTE	PowerOn
-			
-	-	7	0
-	-	7	4/3
-	-	-	M

Description: Write program control protection level

51050	ACCESS_WRITE_PROGRAM	-	-
-	Write part program protection level	BYTE	PowerOn
-			
-	-	4	0
-	-	7	4/3
-	-	-	M

Description: Write part program protection level

51051	ACCESS_WRITE_RPA	-	-
-	Protection level write R variables	BYTE	PowerOn
-			
-	-	7	0
-	-	7	4/3
-	-	-	M

Description: Protection level write R variables

51052	ACCESS_WRITE_SEA	-	-
-	Protection level write setting data	BYTE	PowerOn
-			
-	-	7	0
-	-	7	4/3
-	-	-	M

Description: Protection level write setting data

51053	ACCESS_WRITE_BASEFRAME	-	-
-	Write basic work offset protection level	BYTE	PowerOn
-			
-	-	7	0
-	-	7	4/3
-	-	-	M

Description: Write basic work offset (basic frame) protection level

51054	ACCESS_WRITE_CYCFRAME	-	-
-	Write cycle frame protection level	BYTE	PowerOn
-			
-	-	7	0
-	-	7	4/3
-	-	-	M

Description: Write cycle frame protection level

51055	ACCESS_WRITE_EXTFRAME	-	-
-	Write external WO protection level	BYTE	PowerOn
-			
-	-	7	0
-	-	7	4/3
-	-	-	M

Description: Write external work offset protection level

2.5 Machine and setting data cycles

51056	ACCESS_WRITE_PARTFRAME	-	-
-	Write table reference protection level	BYTE	PowerOn
-			
-	-	7	0
-	-	7	4/3
-	-	-	M

Description: Write table reference protection level

51057	ACCESS_WRITE_SETFRAME	-	-
-	Write basic reference protection level	BYTE	PowerOn
-			
-	-	7	0
-	-	7	4/3
-	-	-	M

Description: Write basic reference protection level

51058	ACCESS_WRITE_TOOLFRAME	-	-
-	Write basic tool reference protection level	BYTE	PowerOn
-			
-	-	7	0
-	-	7	4/3
-	-	-	M

Description: Write basic tool reference protection level

51059	ACCESS_WRITE_TRAFRAME	-	-
-	Write transformation frame protec. level	BYTE	PowerOn
-			
-	-	7	0
-	-	7	4/3
-	-	-	M

Description: Write transformation frame protec. level

51060	ACCESS_WRITE_USERFRAME	-	-
-	Write settable work offset protection level	BYTE	PowerOn
-			
-	-	4	0
-	-	7	4/3
-	-	-	M

Description: Write settable work offset (G54 ... G599) protection level

51061	ACCESS_WRITE_WPFRAME	-	-
-	Write workpiece reference protection level	BYTE	PowerOn
-			
-	-	7	0
-	-	7	4/3
-	-	-	M

Description: Write workpiece reference protection level

51062	ACCESS_WRITE_FINE	-	-
-	Write protection level for fine offset of all work offsets	BYTE	PowerOn
-			
-	-	6	0
-	-	7	4/3
-	-	-	M

Description: Write protection level for fine offset of all work offsets

51063	ACCESS_SET_ACT_VALUE	-	-
-	Set actual value protection level	BYTE	PowerOn
-			
-	-	4	0
-	-	7	4/3
-	-	-	M

Description: Set actual value protection level

51064	ACCESS_WRITE_PROGLIST	-	-
-	Write protection level of program list in USER area	BYTE	Immediately
-			
-	-	4	0
-	-	7	4/3
-	-		M

Description: Minimum protection level required to change the program list in the USER area (program manager)

51065	NUM_DISPLAYED_CHANNELS	-	-
-	Number of channels displayed simultaneously	BYTE	PowerOn
-			
-	-	1	1
-	-	4	4/3
-	-		M

Description: Setting of the number of channels to be displayed simultaneously in the machine operating area and in the multi-channel editor.

51066	ORDER_DISPLAYED_CHANNELS	-	-
-	Channel numbers of the channels displayed	STRING	PowerOn
-			
-	-	1;	-
-	-	-	4/3
-	-		M

Description: Contains the numbers of the channels to be displayed under machine in the multi-channel view, in the desired order and separated by commas, semicolons or spaces.

51067	ENABLE_HANDWHEEL_WINDOW	-	-
-	Show handwheel window	BYTE	PowerOn
-			
-	-	1	0
-	-	1	4/2
-	-		M

Description: If the machine data is set to 0, the window for handwheel assignment is hidden

51068	SPIND_DRIVELOAD_FROM_PLC1	-	-
-	Machine axis index of spindle 1 utilization display from PLC	BYTE	PowerOn
-			
-	-	0	0
-	-	31	4/2
-	-		M

Description: Machine axis index of a spindle (analog), which obtains the data for the utilization display in the T,F,S window from the PLC.

SINUMERIK 840D sl: DB19.DBB6

SINUMERIK 828D : DB1900.DBB5006

51069	SPIND_DRIVELOAD_FROM_PLC2	-	-
-	Machine axis index of spindle 2 utilization display from PLC	BYTE	PowerOn
-			
-	-	0	0
-	-	31	4/2
-	-		M

Description: Machine axis index of a spindle (analog), which refers to the data for the utilization display in the T,F,S window from the PLC (DB19.DBB7).

51070	ACCESS_CAL_TOOL_PROBE	-	-
-	Protection level for calibration of the tool probe (ShopTurn)	BYTE	PowerOn
-			
-	-	4	0
-	-	7	4/3
-	-		M

Description: Protection level for calibration of the tool probe (ShopTurn)

2.5 Machine and setting data cycles

51071	ACCESS_ACTIVATE_CTRL_E	-	-
-	Protection level of Ctrl-Energy	BYTE	PowerOn
-			
-	-	1	0
-	-	7	4/3
-	-	M	

Description: Protection level for activating, disabling and enabling energy-saving profiles.

51072	ACCESS_EDIT_CTRL_E	-	-
-	Protection level of Ctrl-Energy for changing profiles	BYTE	PowerOn
-			
-	-	2	0
-	-	7	4/3
-	-	M	

Description: Protection level of Ctrl-Energy: Definition of energy-saving profiles

51073	ACCESS_SET_SOFTKEY_ACCESS	-	-
-	Protection level of "Adapt softkeys"	BYTE	PowerOn
-			
-	-	3	0
-	-	7	4/3
-	-	M	

Description: Protection level for the softkey "Adapt softkeys", which is used to change the access levels of other softkeys.

51074	ACCESS_WRITE_WPC_COUNTER	-	-
-	Write protection level of workpiece counter	BYTE	PowerOn
-			
-	-	7	0
-	-	7	4/3
-	-	M	

Description: Write protection level of workpiece counter in the Times/Counters mask in the machine area

51075	ACCESS_WRITE_MDI	-	-
-	Write protection level MDI program	BYTE	PowerOn
-			
-	-	7	0
-	-	7	4/3
-	-	M	

Description: Write protection level MDI program

51160	ACCESS_WRITE_CA_MACH_JOG	-	-
-	Write protection level collision monitoring machine jog	BYTE	PowerOn
-			
-	-	6	0
-	-	7	7/1
-	-	M	

Description: This machine data defines the protection level from which the machine/machine collision monitoring can be activated or deactivated under jog.

51161	ACCESS_WRITE_CA_MACH_AUTO	-	-
-	Write protection level, collision monitoring machine automatic	BYTE	PowerOn
-			
-	-	3	0
-	-	7	7/1
-	-	M	

Description: This machine data defines the protection level from which the machine/machine collision monitoring can be activated or deactivated under automatic.

51162	ACCESS_WRITE_CA_TOOL	-	-
-	Write protection level collision monitoring tool	BYTE	PowerOn
-			
-	-	1	0
-	-	7	7/4
-	-	M	

Description: This machine data defines the protection level from which the collision monitoring for tools can be activated or deactivated.

51198	ACCESS_READ_TM_ALL_PARAM	-	-
-	Protection level tool management details - read all parameters	BYTE	PowerOn
-			
-	-	1	0
-	-	7	7/4
-	-	M	

Description: Protection level tool management details - read all parameters

51199	ACCESS_WRITE_TM_GRIND	-	-
-	Protection level of tool management for writing grinding data	BYTE	PowerOn
-			
-	-	4	0
-	-	7	7/4
-	-	M	

Description: Protection level of tool management for writing grinding data

51200	ACCESS_WRITE_TM_GEO	-	-
-	Write tool offset geometry data protection level	BYTE	PowerOn
-			
-	-	5	0
-	-	7	7/4
-	-	M	

Description: Write tool offset geometry data protection level

51201	ACCESS_WRITE_TM_WEAR	-	-
-	Write tool offset wear data protection level	BYTE	PowerOn
-			
-	-	6	0
-	-	7	7/4
-	-	M	

Description: Write tool offset wear data protection level

51202	ACCESS_WRITE_TM_WEAR_DELTA	-	-
-	Protection level for tool offset restricted writing of wear data	BYTE	PowerOn
-			
-	-	7	0
-	-	7	7/4
-	-	M	

Description: Protection level for restricted writing of tool wear values
S. MD51213: TM_WRITE_WEAR_DELTA_LIMIT

51203	ACCESS_WRITE_TM_SC	-	-
-	Write tool offset sum offset protection level	BYTE	PowerOn
-			
-	-	7	0
-	-	7	7/4
-	-	M	

Description: Write tool offset sum offset protection level

51204	ACCESS_WRITE_TM_EC	-	-
-	Write tool offset use offsets protection level	BYTE	PowerOn
-			
-	-	7	0
-	-	7	7/4
-	-	M	

2.5 Machine and setting data cycles

Description: Write tool offset use offsets protection level

51205	ACCESS_WRITE_TM_SUPVIS	-	-
-	Write tool offset monitoring data protection level	BYTE	PowerOn
-			
-	-	7	0
		7	7/4
			M

Description: Write tool offset monitoring data protection level

One authorization applies to all limit values: quantity, service life, wear and the monitoring type.

51206	ACCESS_WRITE_TM_ASSDNO	-	-
-	Write tool offset unique D number protection level	BYTE	PowerOn
-			
-	-	7	0
		7	7/4
			M

Description: Write tool offset unique D number protection level

51207	ACCESS_WRITE_TM_WGROUP	-	-
-	Write tool offset wear groups protection level	BYTE	PowerOn
-			
-	-	7	0
		7	7/4
			M

Description: Write tool offset wear groups (magazine location / magazine) protection level

51208	ACCESS_WRITE_TM_ADAPT	-	-
-	Write tool offset adapter data protection level	BYTE	PowerOn
-			
-	-	7	0
		7	7/4
			M

Description: Write tool offset tool adapter geometry data protection level

51209	ACCESS_WRITE_TM_NAME	-	-
-	Write tool offset tool name protection level	BYTE	PowerOn
-			
-	-	4	0
		7	7/4
			M

Description: Write tool offset tool name and duplo data protection level

51210	ACCESS_WRITE_TM_TYPE	-	-
-	Write tool offset tool type protection level	BYTE	PowerOn
-			
-	-	4	0
		7	7/4
			M

Description: Write tool offset tool type protection level

51211	ACCESS_READ_TM	-	-
-	Read tool offset data protection level	BYTE	PowerOn
-			
-	-	7	0
		7	7/4
			M

Description: Read tool offset data protection level

51212	TM_WRITE_WEAR_ABS_LIMIT	-	-
mm	Maximum tool wear value	DOUBLE	PowerOn
-			
-	-	0.999	0
		10	7/4
			M

Description: Using TM_WRITE_WEAR_ABS_LIMIT, the max. possible value of a tool wear is limited absolutely, independently of the current protection level (keyswitch position), i.e. also independently of ACCESS_WRITE_TM_WEAR. Absolute and incremental wear limitation can be combined, i.e. the wear can be changed incrementally up to the absolute limit. See MD51213.

The value 0 disables the limitation of the wear input.

51213	TM_WRITE_WEAR_DELTA_LIMIT	-	-
mm	Maximum difference value restricted tool wear input	DOUBLE	PowerOn
-			
-	-	0	0
		10	7/4
			M

Description: When entering tool offsets, the value of the change from the previous value to the new value cannot exceed the value set here.

With TM_WRITE_WEAR_DELTA_LIMIT, the change to a tool wear can be limited incrementally, if the current protection level is the same as or higher than the one set in ACCESS_WRITE_TM_WEAR_DELTA. With the current protection level being the same or higher than ACCESS_WRITE_TM_WEAR, an incremental limitation is no longer performed. Absolute and

incremental wear limitation can be combined, i.e. the wear can be changed up to the absolute limit. See MD51212

The value 0 disables limitation of the wear input.

51214	TM_WRITE_LIMIT_MASK	-	-
-	Validity of the restricted tool wear input	BYTE	PowerOn
-			
-	-	7	0
		7	7/4
			M

Description: Validity of the restricted tool wear input

Bit 0: use for cutting edge data, wear

Bit 1: use for SC data, sum offsets

Bit 2: use for EC data, use offsets

Bit 0+1+2: use for all data, wear, SC, EC

51215	ACCESS_WRITE_TM_ALL_PARAM	-	-
-	Protection level TM details - write all parameters	BYTE	PowerOn
-			
-	-	1	0
		7	7/4
			M

Description: Protection level TM details - write all parameters

51216	ACCESS_TM_TOOL_CREATE	-	-
-	Protection level TM create tool	BYTE	PowerOn
-			
-	-	4	0
		7	7/4
			M

Description: Protection level TM create tool

2.5 Machine and setting data cycles

51217	ACCESS_TM_TOOL_DELETE	-	-
-	Protection level TM delete tool	BYTE	PowerOn
-			
-	-	4	0
-	-	7	7/4
-	-	M	

Description: Protection level TM delete tool

51218	ACCESS_TM_TOOL_LOAD	-	-
-	Protection level TM load tool	BYTE	PowerOn
-			
-	-	4	0
-	-	7	7/4
-	-	M	

Description: Protection level TM load tool

51219	ACCESS_TM_TOOL_UNLOAD	-	-
-	Protection level TM unload tool	BYTE	PowerOn
-			
-	-	4	0
-	-	7	7/4
-	-	M	

Description: Protection level TM unload tool

51220	ACCESS_TM_TOOL_MOVE	-	-
-	Protection level TM relocate tool	BYTE	PowerOn
-			
-	-	4	0
-	-	7	7/4
-	-	M	

Description: Protection level TM relocate tool

51221	ACCESS_TM_TOOL_REACTIVATE	-	-
-	Protection level TM reactivate tool	BYTE	PowerOn
-			
-	-	4	0
-	-	7	7/4
-	-	M	

Description: Protection level TM reactivate tool

51222	ACCESS_TM_TOOL_MEASURE	-	-
-	Protection level TM measure tool	BYTE	PowerOn
-			
-	-	4	0
-	-	7	7/4
-	-	M	

Description: Protection level TM measure tool
Direct jump from tool list to measuring screen

51223	ACCESS_TM_TOOLEEDGE_CREATE	-	-
-	Protection level TM create tool cutting edge	BYTE	PowerOn
-			
-	-	4	0
-	-	7	7/4
-	-	M	

Description: Protection level TM create tool cutting edge

51224	ACCESS_TM_TOOLEEDGE_DELETE	-	-
-	Protection level TM delete tool cutting edge	BYTE	PowerOn
-			
-	-	4	0
-	-	7	7/4
-	-	M	

Description: Protection level TM delete tool cutting edge

51225	ACCESS_TM_MAGAZINE_POS	-	-
-	Protection level TM position magazine	BYTE	PowerOn
-			
-	-	4	0
-	-	7	7/4
-	-	-	M

Description: Protection level TM position magazine

51226	FUNCTION_MASK_SIM	-	-
-	Function mask for simulation	DWORD	PowerOn
-			
-	-	0	-
-	-	-	7/3
-	-	-	M

Description: Function mask for simulation

- Bit 0: No automatic start when simulation is selected
- Bit 1: Deactivate simulation
- Bit 4: Ignore frame components in X and Y (compatibility)
- Bit 5: Turning tool can be rotated in the tool spindle
- Bit 6: Enable handwheel as simulation override (values from DB19.DBW400)
- Bit 7: Interpret handwheel values from DB19.DBW400 as absolute values
- Bit 10: Hide zero point symbol
- Bit 22: Machine model for simulation from kinematic chain (also without collision avoidance)

51228	FUNCTION_MASK_TECH	-	-
-	Function mask Cross-technology	DWORD	PowerOn
-			
-	-	0	-
-	-	-	7/3
-	-	-	M

Description: Function mask for all technologies

- Bit 0: G code programming without multi-channel data
- If bit 0 = 1, no multi-channel data will be offered for job lists which only contain G code programs.
- Bit 1: Enable print function of Editor
- Bit 2: With external program selection (e.g. via PLC), set start disable (program check).

51230	ENABLE_LADDER_DB_ADDRESSES	-	-
-	DB address activation in the PLC ladder viewer	BOOLEAN	Immediately
-			
-	-	1	0
-	-	1	7/2
-	-	-	M

Description: DB address activation in the PLC ladder viewer

51231	ENABLE_LADDER_EDITOR	-	-
-	Activation of PLC ladder add-on tool for INT100/101	BOOLEAN	Immediately
-			
-	-	1	0
-	-	1	7/2
-	-	-	M

Description: Activation of PLC ladder add-on tool for INT100/101

2.5 Machine and setting data cycles

51232	ENABLE_LADDER_EDITOR_ADV	-	-
-	Activation of PLC ladder editor for the complete PLC project	BOOLEAN	Immediately
-			
-	-	1	0
-	-	1	7/1
-	-	0	M

Description: Activation of PLC ladder editor for the complete PLC project

51233	ENABLE_GSM_MODEM	-	-
-	GSM modem activation for Easy Message	BOOLEAN	PowerOn
-			
-	-	0	0
-	-	1	7/2
-	-	0	I

Description: GSM modem activation for Easy Message

51235	ACCESS_RESET_SERV_PLANNER	-	-
-	Protection level for acknowledgment of maintenance tasks	BYTE	Immediately
-			
-	-	3	0
-	-	7	4/2
-	-	0	M

Description: Protection level for acknowledgment of maintenance tasks

51240	MACHINE_REGISTRATION	-	-
-	Machine registration	DWORD	Immediately
-			
-	-	1	-
-	-	-	7/2
-	-	-	M

Description: Machine registration
 Bit 0: Enable machine registration via QR code
 Bit 1: Machine has been registered

51300	MAXNUM_WAITM_USER	-	-
-	Number of wait marks available to the end user	BYTE	PowerOn
-			
-	-	100	0
-	-	100	7/4
-	-	0	M

Description: Number of wait marks available to the end user

51600	MEA_CAL_WP_NUM	-	-
-	Number of calibration data fields for workpiece probes	BYTE	Immediately
-			
-	-	40	0
-	-	40	7/2
-	-	0	I

Description: The workpiece probe calibration data refer to the workpiece coordinate system (Work)!
 In the data fields, the workpiece probe calibration data of the technologies Milling and Turning are stored!

51601	MEA_CAL_EDGE_NUM	-	-
-	Number of geometry data fields of gauging block, workpiece probe	BYTE	Immediately
-			
-	-	3	0
-	-	3	7/2
-	-	0	I

Description: The gauging block is exclusively used to calibrate the workpiece probe of the Turning technology!

51602	MEA_CAL_TP_NUM	-	-
-	Number of calibration data fields for tool probes	BYTE	Immediately
-			
-	-	6	0
-	-	6	7/2
-	-	6	I

Description: The value of this parameter corresponds to the number of tool probe calibration data records
set up for the machine coordinate system (Machine).

51603	MEA_CAL_TPW_NUM	-	-
-	Number of calibration data fields for tool probes	BYTE	Immediately
-			
-	-	6	0
-	-	6	7/2
-	-	6	I

Description: The value of this parameter corresponds to the number of tool probe calibration data records
set up for the workpiece coordinate system (Work).

51618	MEA_CM_ROT_AX_POS_TOL	-	-
degrees	Tolerance of rotary axis positions - measuring with orientable toolholder	DOUBLE	Immediately
-			
-	-	0.5	-1
-	-	1	7/3
-	-	1	I

Description: Parameter for measuring with orientable tool carrier
Entries in parameter \$MN_MEA_CM_ROT_AX_POS_TOL are effective only if \$MNS_MEA_FUNCTION_MASK bit2 or bit16 is set by MD51740.
The real angle position of the rotary axes can deviate from the programmed one (exact stop fine window).
This deviation depends on the position control features of the axis. The maximum deviation expected on the concrete axis
must be entered in this parameter. When the tolerance is exceeded, alarm 61442 "Toolholder not in parallel with the geometry axes" is displayed.

51740	MEA_FUNCTION_MASK	-	-
-	Function mask for measuring cycles, workpiece and tool measuring	DWORD	Immediately
-			
-	-	67	-
-	-	-	7/3
-	-	-	M

Description: Function mask for measuring cycles
Bit 0: Workpiece measurement, calibration status monitoring
0: Calibration monitoring not active
1: Calibration monitoring active
Between calibration and measurement, the following states are monitored:
- Working plane (G17, 18, 19)
- Probe type (3D probe, type 710, mono probe, type 712, L probe, type 713, star probe, type 714)
- Length reference of the probe (center of the probe ball, probe ball circumference)
- The following alarms 61341, 61419, 61420 can be output.
Note: - These monitoring functions are always active when "measuring in JOG".
- See also SD54740 \$SNS_MEA_FUNCTION_MASK, bit 4.

2.5 Machine and setting data cycles

Bit 1: Workpiece measurement, milling technology, length reference of the workpiece probe

- 0: Tool length in the infeed axis, relative to the center of the probe ball (TCP)
- 1: Tool length in the infeed axis, relative to the circumference of the probe ball

Bit 2: Workpiece measurement, taking into account the orientation of tool carriers for the tool offset

- 0: The tool components are corrected according to the orientation of the tool carrier when measuring. This is valid for the orientations 0°, 90°, 180°, and 270°.
- 1: The tool components are corrected according to the orientation of the tool carrier in the initial setting.

Bit 4: Workpiece measurement, milling technology, probe is permanently mounted on the machine

- 0: When measuring, the workpiece probe is located in a tool spindle.
- 1: The workpiece probe is permanently mounted on the machine.

Not all measurement variants are available. If an inadmissible measurement variant is selected, alarm 61373 is output.

Bit 5: Workpiece measurement, correction in WO coarse if no fine offset is set up

- 0: Only the measurement difference is entered in the coarse offset of the WO (compatibility).
- 1: The absolute offset, corrected by the measurement difference, is entered in the coarse offset of the WO.

Bit 6: Effect of the feedrate override in measuring blocks of measuring cycles

- 0: Measuring blocks are traversed in the measuring cycles with the current feedrate override (compatibility).
- 1: Measuring blocks are traversed in the measuring cycles with 100% feedrate override if the feedrate override is set >0.

Bit 7: Workpiece measurement, accept active WO in inactive WO, only JOG mode, set edge

- 0: In JOG mode, "Set edge" function with correction of measurement result in an inactive work offset (target frame), only the measuring axis with the result is written by the geometry axes in the target frame. For the non-measured geometry axes, no values are accepted from the active work offset (source frame). (Compatibility) Of all non-geometry axes (rotary and auxiliary axes), mirrorings, rotations and translations are accepted from the active work offset (source frame) into the selected inactive work offset (target frame). (Compatibility) This description applies to automatic measurement using an electronic probe and equally to the "Scratching" function with a machining tool.
- 1: In JOG mode, "Set edge" function with correction of the measurement result in an inactive work offset (target frame), the measuring axis in the target frame is written with the measurement result.

For all other axes (geometry, rotary and auxiliary axes) mirrorings, rotations and translations are accepted from the active work offset (source frame) into the selected inactive work offset (target frame).

This description applies to automatic measurement using an electronic probe and equally to the "Scratching" function with a machining tool.

Bit 14: Workpiece, simultaneous measurement function active

0: The simultaneous measurement function is inactive (default).

1: The simultaneous measurement function is active. This setting is intended for machines with two spindles that operate simultaneously.

Bit 15: Workpiece measurement, traverse measuring block with path behavior G60, exact stop at the end of the block

0: The measuring block is traversed in continuous-path mode G64.

1: The measuring block is traversed with path behavior G60, exact stop at the end of the block.

Bit 16: Tool measurement, turning technology, taking into account the orientation of the tool carrier

0: The tool component is corrected according to the orientation of the tool carrier when measuring.

1: The tool component is corrected according to the orientation of the tool carrier in the initial setting.

51742	MEA_ACCESS_EXEC			-	-	
-	Meas. cycles: Limitation of protection levels when writing system variables			DWORD	Immediately	
-						
-	10	1, 1, 1, 1, 1, 1, 1, 1...	1	7	7/1	M

Description: Limitation of the protection levels when writing system variables during the execution of measuring cycles.

MD51742 limits one range of the current protection level between the setting of the protection level in MD11160 \$NM_ACCESS_EXEC_CST and the setting in MD51742 when executing the measuring cycles.

The field elements [0] to [9] are used as follows:

[0] Measure all kinematics

[1] to [9] reserved

For the meaning of the numerical values (protection level) see MD11160

51750	J_MEA_M_DIST			-	-	
mm	Measuring path for measuring with ShopMill, in automatic mode			DOUBLE	Immediately	
-						
-	-	5	-10000	10000	7/5	I

Description: This parameter defines the measuring path in front of and behind the measuring setpoint.

It is only used by old ShopMill measuring cycles (powerline).

2.5 Machine and setting data cycles

51751	J_MEA_M_DIST_MANUELL	-	-
mm	Measuring path, for "Measure in JOG"	DOUBLE	Immediately
-			
-	-	10	-10000
		10000	7/5
			I

Description: This parameter defines the measuring path in front of and behind the measuring setpoint.

51752	J_MEA_M_DIST_TOOL_LENGTH	-	-
mm	Measuring path for tool length measuring, for "Measure in JOG"	DOUBLE	Immediately
-			
-	-	2	-10000
		10000	7/5
			I

Description: This parameter defines the measuring path in front of and behind the measuring setpoint.

51753	J_MEA_M_DIST_TOOL_RADIUS	-	-
mm	Measuring path for tool radius measuring, for "Measure in JOG"	DOUBLE	Immediately
-			
-	-	1	-10000
		10000	7/5
			I

Description: This parameter defines the measuring path in front of and behind the measuring setpoint.

51757	J_MEA_COLL_MONIT_FEED	-	-
mm/min	Feedrate in the plane w. active collision detection, for "Measure in JOG"	DOUBLE	Immediately
-			
-	-	1000	0
		100000	7/5
			I

Description: Feedrate in the working plane w. active collision detection

51758	J_MEA_COLL_MONIT_POS_FEED	-	-
mm/min	Infeed rate with active collision detection, for "Measure in JOG"	DOUBLE	Immediately
-			
-	-	1000	0
		100000	7/5
			I

Description: Feedrate of the infeed axis with active collision detection, for "Measure in JOG".

51770	J_MEA_CAL_RING_DIAM	-	-
mm	Calibration ring diameter, for "Measure in JOG"	DOUBLE	Immediately
-			
-	40	-1, -1, -1, -1, -1, -1, -1, -1	-1
		-1...	10000
			7/5
			I

Description: Calibration ring diameter, for probe sphere calibration in the plane, for "Measure in JOG"

51772	J_MEA_CAL_HEIGHT_FEEDAX	-	-
mm	Calibration height in the infeed axis, for probe length calibration	DOUBLE	Immediately
-			
-	40	-99999, -99999, -99999, -99999, -99999, -99999, -99999, -99999...	-100000
			100000
			7/5
			I

Description: Calibration height in the infeed axis for probe length calibration, for "Measure in JOG"
The calibration height must be entered with reference to the the workpiece coordinate system (Work)!

51780	J_MEA_T_PROBE_DIAM_RAD	-	-
mm	Diameter of the tool probe for radius measurement	DOUBLE	Immediately
-			
-	6	0, 0, 0, 0, 0, 0	0

Description: Effective grinding wheel diameter of the tool probe for radius measurement on milling tools

51781	MEA_T_PROBE_THICKNESS	-	-
mm	Tool probe thickness	DOUBLE	Immediately
-			
-	6	0, 0, 0, 0, 0, 0	0

Description: Tool probe thickness for automatic approach of turning tools to the probes at milling/turning machines

51784	J_MEA_T_PROBE_APPR_AX_DIR	-	-
-	Approach direction in the plane on the tool probe, for "Measure in JOG"	DWORD	Immediately
-			
-	6	-1, -1, -1, -1, -1, -1	-2

Description: Approach direction in the plane on the tool probe, for "Measure in JOG"
= -2 negative direction 2nd measuring axis
= -1 negative direction 1st measuring axis
= 0 or 1 positive direction 1st measuring axis
= 2 psotive direction 2nd measuring axis

51786	J_MEA_T_PROBE_MEASURE_DIST	-	-
mm	Measur. path for tool measurem. w. stationary spindle, for "Measure in JOG"	DOUBLE	Immediately
-			
-	-	10	-10000

Description: Measuring path for tool probe calibration and tool measuring with stationary spindle, in front of and behind the expected switching position.

51840	GRIND_FUNCTION_MASK	-	-
-	Function mask for grinding cycles	DWORD	Immediately
-			
-	-	0	-

Description: Function mask for grinding cycles
Bit 0: Reference point for recording dresser/grinding wheel is a work offset
0: Deselect work offset as reference point
1: Select work offset as reference point
Bit 1: Reserved

2.5 Machine and setting data cycles

51900	CAS_ACCES_LEVEL	-	-
-	Collision Avoidance System access level for UI functionality	DWORD	Immediately
-			
-	32	0, 0, 0, 0, 0, 0, 0, 0...	0
-		7	7/3
-			M

Description: Collision Avoidance System access levels
Each field represents an access level of a CAS UI functionality

51901	CAS_CONFIG_MASK	-	-
-	Collision Avoidance System function mask	DWORD	Immediately
-			
-	-	0	-
-		-	7/3
-			M

Description: Collision Avoidance System function mask
Bit 0: reserved
Bit 1: reserved

51902	CAS_CONFIG_MASK_EXT	-	-
-	Collision Avoidance System extended function mask	DWORD	Immediately
-			
-	-	0	-
-		-	7/3
-			M

Description: Collision Avoidance System extended function mask
Bit 0: reserved
Bit 1: reserved

51903	CAS_CONFIG_INT	-	-
-	Collision Avoidance System configuration - integers	DWORD	Immediately
-			
-	32	0, 0, 0, 0, 0, 0, 0, 0...	-
-		-	7/3
-			M

Description: Collision Avoidance System configuration - integers
Each field represents a CAS setting value.
Only integers are allowed.

52000	DISP_COORDINATE_SYSTEM	-	-
-	Coordinate system position	BYTE	PowerOn
-			
-	-	0	0
-		47	7/3
-			M

Description: With this MD, you adapt the operator panel's coordinate system to the machine's coordinate system. Depending on the selected position, all help screens, the sequence graphic, the simulation, and the input fields with the circular direction specified will change automatically in the user interface.
The machine data is evaluated in the cycles.
Also note MD52210 \$MCS_FUNCTION_MASK_DISP, bit 1.

52001	DISP_COORDINATE_SYSTEM_2	-	-
-	Coordinate system for turning on milling machines	BYTE	PowerOn
-			
-	-	0	0
-		47	7/3
-			M

Description: With this MD you specify the coordinate system for turning operations on milling machines.
See also MD52000 \$MCS_DISP_COORDINATE_SYSTEM.

52004	PROG_COORDINATE_SYS_CHAN	-	-
-	Coordinate system during programming as described in the specified channel	BYTE	PowerOn
-			
-	-	0	0
		10	7/3
			M

Description: You can set this MD so that the coordinate system is displayed during programming as it is described in the specified channel.

0: Display as described in own channel

n: Display as described in channel n

52005	DISP_PLANE_MILL	-	-
-	Plane selection Milling	BYTE	Immediately
-			
-	-	0	0
		19	7/3
			M

Description: Plane selection Milling

0: plane selection on the operator panel

17: always G17

18: always G18

19: always G19

52006	DISP_PLANE_TURN	-	-
-	Plane selection Turning	BYTE	Immediately
-			
-	-	18	0
		19	ReadOnly
			M

Description: Plane selection Turning

0: plane selection on the operator panel

17: always G17

18: always G18

19: always G19

52010	DISP_NUM_AXIS_BIG_FONT	-	-
-	Number of actual values with large font	BYTE	PowerOn
-			
-	-	3	0
		31	7/3
			M

Description: Number of actual values with large font

52011	ADJUST_NUM_AXIS_BIG_FONT	-	-
-	Adapt number of act val w large font dynamically to no. of geometry axes	BYTE	PowerOn
-			
-	-	0	0
		2	7/3
			M

Description: Adapt the number of actual values with large font if the number of geometry axes changes, e.g. due to transformations like TRANSMIT or TRACYL.

0 = Only MD52010 "DISP_NUM_AXIS_BIG_FONT" is valid. The number is assigned as a fixed value.

1 = Only the geometry axes are displayed in large font. MD 52010 "DISP_NUM_AXIS_BIG_FONT" is ignored.

2 = The number of geometry axes plus the content of MD 52010 "DISP_NUM_AXIS_BIG_FONT" are displayed in large font.

2.5 Machine and setting data cycles

52020	ORIAXES_EULER_ANGLE_NAME			-	-	
-	Axis identifiers of the orientation axes: Euler angle or geometry axis name			BYTE	PowerOn	
-						
-	-	0	0	1	4/3	M

Description: This MD specifies whether the axis identifiers of the orientation axes are Euler angle names or channel geometry axis names.

Possible values are:

- = 0 Orientation axis name from the channel block geometry axis name with the index 3 to 5
- = 1 Orientation axis name is the name of the Euler angle from the general machine data

52032	STAT_DISPLAY_BASE			-	-	
-	Number basis for display of articulated joint STAT			BYTE	PowerOn	
-						
-	-	0	0	16	4/3	M

Description: Numerical basis for displaying the articulated joint STAT

If the value of the data is greater than 0, MD51032 \$MNS_STAT_DISPLAY_BASE is ignored for this channel.

- 00: MD51032 is active
- 02: Representation as binary value
- 10: Representation as decimal value
- 16: Representation as hexadecimal value

The machine data activates not only the STAT display channel-specifically on the main screen, but also the display during "TEACH IN".

52033	TU_DISPLAY_BASE			-	-	
-	Number basis for display of rotary axis position TU			BYTE	PowerOn	
-						
-	-	0	0	16	4/3	M

Description: Numerical basis for displaying the rotary axis position TU

If the value of the data is greater than 0, MD51033 \$MNS_TU_DISPLAY_BASE is ignored for this channel.

- 00: MD51033 is active
- 02: Representation as binary value
- 10: Representation as decimal value
- 16: Representation as hexadecimal value

The machine data activates not only the TU display channel-specifically on the main screen, but also the display during "TEACH IN".

52200	TECHNOLOGY			-	-	
-	Technology			BYTE	PowerOn	
-						
-	-	0	0	4	7/1	M

Description: Technology

- 0: no specific configuration
- 1: turning
- 2: milling
- 3: cylindrical grinding

4: surface grinding

Also note MD52201 \$MCS_TECHNOLOGY_EXTENSION

52201	TECHNOLOGY_EXTENSION			-	-	
-	Extended technology			BYTE	PowerOn	
-						
-	-	0	0	4	7/1	M

Description: Advanced technology
 0: no specific configuration
 1: turning
 2: milling
 Also note MD52200 \$MCS_TECHNOLOGY.
 Example:
 Turning machine with milling technology
 MD 52200 \$MCS_TECHNOLOGY = 1
 MD 52201 \$MCS_TECHNOLOGY_EXTENSION = 2

52206	AXIS_USAGE			-	-	
-	Meaning of the axes in the channel			BYTE	PowerOn	
-						
-	20	0,0,0,0,0,0,0,0,0,0, 0,0,0,0,0,0,0,0,0,0	-	-	7/3	M

Description: Meaning of the axes in the channel
 0 = no special meaning)
 1 = tool spindle (rotating tool)
 2 = auxiliary spindle (rotating tool)
 3 = main spindle (turning)
 4 = separate C axis of the main spindle (turning)
 5 = counterspindle (turning)
 6 = separate C axis of the counterspindle (turning)
 7 = linear axis of the counterspindle (turning)
 8 = tailstock (turning)
 9 = steady rest (turning)
 10 = B axis in the head (turning and cylindrical grinding)
 11 = reserved
 12 = B axis in the counterspindle (turning)
 13 = transverse travel X of the counterspindle (turning)

52207	AXIS_USAGE_ATTRIB			-	-	
-	Axis attributes			DWORD	PowerOn	
-						
-	20	0,0,0,0,0,0,0,0,0,0, 0,0,0,0,0,0,0,0,0,0	-	-	7/3	M

Description: Attributes of the axes
 Bit 0: rotates around 1st geometry axis (for rotary axes)
 Bit 1: rotates around 2nd geometry axis (for rotary axes)
 Bit 2: rotates around 3rd geometry axis (for rotary axes)
 Bit 3: Positive direction of rotation is counter-clockwise (for rotary axes)
 The rotary axes are always viewed in the negative geometry axis direction.

2.5 Machine and setting data cycles

For turning machines, a spindle is always viewed from the interior.

Bit 4: Displayed direction of rotation for M3 is counter-clockwise (for spindles)

The viewing direction can be selected. Either viewed outward from the inside or from the outside toward the spindle.

However, the same selection must be made for all spindles.

Bit 5: Direction of rotation M3 corresponds to minus rotary axis (for spindles)

This bit must be set in the same way as a PLC bit.

For 840Dsl: PLC bit DBnn.DBX17.6, nn = 31 + machine axis index

For 828D : PLC bit DB38xx.DBX2001.6, xx is machine axis index

Bit 6: Display rotary axis as offset target for measuring

Bit 7: Offer rotary axis in position pattern

The orientation of the axis is defined using bits 0 - 2.

If one of the bits 10 - 12 is set, these bits specify the orientation of the axis for position patterns.

Bit 8: Offer rotary axis for blank clamp (on milling machines)

The orientation of the axis is defined using bits 0 - 2.

Bit 9: Spindle is not SPOS capable

Bit 10: Rotary axis rotates around 1st geometry axis (only for position pattern)

Bit 11: Rotary axis rotates around 2nd geometry axis (only for position pattern)

Bit 12: Rotary axis rotates around 3rd geometry axis (only for position pattern)

Bit 13: Position of the axis for blank selection from active W0 (for rotary axes)

This enables a rotary axis set up with simulation/simultaneous recording to be automatically shown in the correct position.

Bit 14: Enable spindle in axis mode for teach-in

Note:

For bits 0 - 2 and 10 - 12, only the 1st set bit is active in each case.

Note on position pattern with rotary axes:

If one of the bits 10 - 12 is set, these bits take precedence over bits 0 - 2.

52210	FUNCTION_MASK_DISP	-	-
-	Function mask for display	DWORD	PowerOn
-			
-	-	3	-

Description:

Function mask for display

Bit 0: Dimension system for programs always in the basic system

Bit 1: Face view when turning in the school coordinate system

Bit 2: Hide softkey "T,S,M" in the jog area

Bit 3: Generate automatic end-of-program in MDI (using the "Delete blocks" softkey)

Bit 4: Display follow-on tool in the T,F,S window

Bit 5: Hide "Act. values Machine" softkey

Bit 6: Hide tool radius/diameter in the T,F,S window

Bit 7: Hide tool lengths in the T,F,S window

Bit 8: Hide tool icon in the T,F,S window

Bit 9: Display "Simple input" selection

Bit 10: Do not offer channel in the job lists

Bit 11: For Work activate the display of the logical spindles

Bit 12: Hide mold making view for G code

Bit 13: Hide channel axes which are currently located in another channel

0: Display channel axes which are currently located in another channel in grey

1: Hide channel axes which are currently located in another channel
 Bit 14: Display overlay of the DRF under the machine
 Bit 15: Display overlay of the tool (\$AA_TOFF) under the machine
 Bit 16: Select JOG axis via HMI
 Bit 17: Select increment via HMI
 Bit 18: Offer select "With set stop override to 0%" with configured stop (only with Powerride)

52211	FUNCTION_MASK_DISP_ZOA	-	-
-	Function mask for displaying overview of work offsets	DWORD	PowerOn
-			
-	-	2097141	- - 7/3 M

Description: Function mask for displaying overview of work offsets

Bit 0: Show Machine position
 Bit 1: Reserved
 Bit 2: Display DRF offset
 Bit 3: Display \$AA_OFF position offset
 Bit 4: Display \$P_PARTFRAME
 Bit 5: Display \$P_SETFRAME
 Bit 6: Display \$P_EXTSFRAME
 Bit 7: Display \$P_ISO1FRAME
 Bit 8: Display \$P_ISO2FRAME
 Bit 9: Display \$P_ISO3FRAME
 Bit 10: Display \$P_ACTBFRAME
 Bit 11: Display \$P_IFFRAME
 Bit 12: Display \$P_TOOLFRAME
 Bit 13: Display \$P_WPFRAME
 Bit 14: Display \$P_TRAFRAME
 Bit 15: Display \$P_PFRAME
 Bit 16: Display \$P_ISO4FRAME
 Bit 17: Display \$P_CYCFRAME
 Bit 18: Display sum of work offsets
 Bit 19: Display offset of active tool
 Bit 20: Display Work position
 Bit 21: Display BCS position
 Bit 22: Display \$P_GFRAME
 Bit 23: Display TOFF
 Bit 24: Display overlay \$AA_TOFF

52212	FUNCTION_MASK_TECH	-	-
-	Function mask Cross-technology	DWORD	Immediately
-			
-	-	0	- - 7/3 M

Description: Function mask for all technologies

Bit 0: Enable swivel plane/align tool with tool carrier
 0: Swivel plane/align tool with tool carrier not enabled
 1: Swivel plane/align tool with tool carrier enabled
 Bit 1: No optimized travel along software limit switches (ShopMill/ShopTurn)
 0: Optimized travel along software limit switches

2.5 Machine and setting data cycles

1: No optimized travel along software limit switches

With optimized travel along the software limit switches, in the swiveled state (with table kinematics) any traversing motions which would go

beyond the software limit switches are truncated. This avoids the alarm 10720 "Axis software limit switches".

Bit 2: Special approach logic for step drill (ShopTurn)

0: Special approach logic for step drill disabled

1: Special approach logic for step drill active

When navigating around the retraction planes, the longest cutting edge (with the same cutting edge position as the active cutting edge) in the same machining direction is always taken into account.

Bit 3: Call block search cycle for ShopMill/ShopTurn

0: In the block search cycle PROG_EVENT.SPF, the cycles E_S_ASUP and F_S_ASUP are not called

1: In the block search cycle PROG_EVENT.SPF, the cycles E_S_ASUP (milling technology) and F_S_ASUP (turning technology) are called. After the block search,

the cycles E_S_ASUP and F_S_ASUP ensure the output of tool and machine commands.

The corresponding cycle is also called with a block search of a G code program.

The bit must be set when ShopMill/ShopTurn is used!

Bit 4: Approach logic via cycle (ShopTurn)

0: Approach logic via NC function

1: Approach logic via ShopTurn cycle

The approach logic via the ShopTurn cycle is only required for diagnostic purposes.

Bit 5: Call SERUPRO block search function

0: In the block search cycle PROG_EVENT.SPF, the cycle CYCLE207 is not called.

1: In the block search cycle PROG_EVENT.SPF, the cycle for SERUPRO (CYCLE207) is called (for block search with SERUPRO program test).

After the block search with program test (SERUPRO), cycle CYCLE207 ensures the output of the collected machine commands.

Bit 6: Work offset ZV cannot be entered as an absolute value (ShopTurn)

0: Parameter ZV, active work offset can be entered as an increment and as an absolute

1: Parameter ZV, active work offset can only be entered as an increment (ShopTurn)

Bit 7: Detect expiry of tool lives in the program (ShopMill/ShopTurn)

0: The tool life is only taken into account when the tool is loaded

1: The tool life is taken into account when changing the machining steps (even if there is no tool change).

Bit 8: Manual machine function active (ShopMill/ShopTurn)

0: Manual machine function is not activated

1: Manual machine function is active

Bit 9: Selection/deselection of work offset via softkey

0: The WO selection/deselection softkey is not available in the work offset table of the settable WOs.

1: The WO selection/deselection softkey is available in the work offset table of the settable WOs.

Bit 10: Enable swivel plane/align tool with kinematic transformation

0: Swivel plane/align tool with kinematic transformation not enabled

1: Swivel plane/align tool with kinematic transformation enabled

Bit 11: Disable position check for drilling and milling tools (ShopTurn)

0: Cutting edge position check is active for drilling and milling tools

1: No cutting edge position check for drilling and milling tools

The cutting edge position check can be disabled for drilling and milling tools if this is necessary on account of the machine design.

Bit 12: Reserved

Bit 13: Approach tool change point Y in the MCS (ShopTurn)

0 : The tool change point in the Work is only approached to 0 in the Y direction if MD52241 \$MCS_TOOL_CHANGE_POS_Y = 0.

1: Tool change point in the MCS is always approached in the Y direction (see MD52241 \$MCS_TOOL_CHANGE_POS_Y).

Bit 14: With approach logic only check tool position with cutting edge (ShopTurn)

0: The approach logic always checks the tool position.

1: The approach logic only checks the tool position if a cutting edge is active.

Bit 15: Do not set \$MC_TOOL_CARRIER_RESET_VALUE after block search

0: The current tool carrier is written in the machine data

\$MC_TOOL_CARRIER_RESET_VALUE in the block search cycle PROG_EVENT.SPF

1: The current tool carrier is not written in the machine data

\$MC_TOOL_CARRIER_RESET_VALUE in the block search cycle PROG_EVENT.SPF

Bit 16: Do not automatically execute swivel plane after block search

0: The section for standard cycles: swivel plane is executed in the block search cycle PROG_EVENT.SPF

1: The section for standard cycles: swivel plane is not executed in the block search cycle PROG_EVENT.SPF

Bit 17: Do not automatically execute align turning tool after block search

0: The section for align turning tool is executed in the block search cycle PROG_EVENT.SPF

1: The section for align turning tool is not executed in the block search cycle PROG_EVENT.SPF

Bit 18: Enable Determine total load: empty axis + workpiece

0: The selection Determine load separately is enabled in the cycle CYCLE782. The determined load value then corresponds to the current workpiece only.

1: The total load is determined in the cycle CYCLE782. The determined load value corresponds to the sum of: empty axis + workpiece.

52214	FUNCTION_MASK_MILL	-	-
-	Function mask for milling	DWORD	Immediately
-			
-	-	0	-
			7/3
			M

Description:

Function mask for milling

Bit 0: Enable cylinder surface transformation (ShopMill)

0: Softkey not enabled for cylinder surface transformation

1: Cylinder surface transformation enabled

Bit 1: Offer fixed table for blank clamping (on milling machines)

0: Fixed table not offered for blank clamping

1: Offer fixed table for blank clamping

(This bit must only be set if a milling machine has a rotary axis and a fixed table for blank clamping.)

Bit 2: Special handling of side mill/saw for polyhedron

0: No special handling of side mill/saw for polyhedron

1: Special handling of side mill/saw for polyhedron

With this tool type, the first infeed is selected so that the upper edge of the tool exactly touches reference point Z0.

At the end of machining, it is completely drawn out laterally from the blank spigot.

This can create an internal polyhedron on a shaft.

2.5 Machine and setting data cycles

Bit 3: Enable inside/rear machining (ShopTurn)
 0: Inside/rear machining not enabled
 1: Enable inside/rear machining in ShopTurn screenforms (applies in ShopTurn screenforms which define the machining planes)

Bit 4: Enable spindle clamping (C axis) (ShopTurn)
 0: The parameter "Clamp/release spindle" is not shown in drilling or milling screenforms. ShopTurn clamps the spindle automatically if this is advantageous for machining.
 1: The parameter "Clamp/release spindle" is shown in drilling and milling screenforms. The operator decides on the machining for which the spindle is clamped.
 If you have implemented the function "Clamp/release spindle" by using the machine manufacturer cycle CUST_TECHCYC.SPF, you can activate the parameter "Clamp/release spindle" in drilling and milling screenforms with this machine data.

Bit 5: Enable spindle control of tool spindle via user interface
 0: Enable spindle control via the NC/PLC interface
 1: Enable spindle control via user interface

Bit 6: Enable spindle control of turning spindle via user interface
 0: Enable spindle control via the NC/PLC interface
 1: Enable spindle control via user interface

Bit 7: Offer fixed table for blank clamping (on drilling machines)
 0: Fixed table not offered for blank clamping
 1: Offer fixed table for blank clamping
 (This bit must only be set if a drilling machine has a rotary axis and a fixed table for blank clamping.)

52216	FUNCTION_MASK_DRILL	-	-
-	Function mask for drilling	DWORD	Immediately
-			
-	-	0	-

Description:

Function mask for drilling

Bit 0: CYCLE84 Show input fields, Technology
 0: Hide input fields
 1: Show input fields

Bit 1: CYCLE840 Show input fields, Technology
 0: Hide input fields
 1: Show input fields

Bit 2: Thread tapping also without encoder (ShopMill/ShopTurn)
 0: Thread tapping only possible with encoder
 1: Thread tapping also possible without encoder
 The setting depends on whether the machine has an encoder for the tool spindle.

Bit 3: Constant cutting speed in relation to the diameter of the centering (ShopMill/ShopTurn)
 0: Constant cutting speed in relation to the diameter of the tool
 1: Constant cutting speed in relation to the diameter of the centering

52218	FUNCTION_MASK_TURN	-	-
-	Function mask Turning	DWORD	Immediately
-			
-	-	0	-

Description:

Function mask for turning

Bit 0: Enable zoom under manual for tool measurement

0: No zoom under manual for tool measurement

1: Enable zoom under manual for tool measurement

Bit 1: Enable parts gripper for cut-off

0: No parts gripper for cut-off

1: Enable parts gripper for cut-off

Bit 2: Enable tailstock

0: Tailstock not enabled

1: The tailstock can be selected in the program.

Bit 3: Enable spindle control of main spindle via user interface

0: Enable spindle control via the NC/PLC interface

1: Enable spindle control via the use interface

Bit 4: Enable spindle control of counterspindle via user interface

0: Enable spindle control via the NC/PLC interface

1: Enable spindle control via the use interface

Bit 5: Enable spindle control of tool spindle via user interface

0: Enable spindle control via the NC/PLC interface

1: Enable spindle control via the use interface

Bit 6: Enable balance cutting for dual-channel stock removal

0: No enable of the balance cutting function for dual-channel stock removal

1: Enable of balance cutting for dual-channel stock removal

In balance cutting, stock is removed from both sides of the workpiece simultaneously. This enables work to be performed with a higher feedrate.

Bit 7: Retraction during stock removal along the contour with G1

0: Retraction during stock removal along the contour with rapid traverse (G0)

1: Retraction during stock removal along the contour with feedrate (G1)

Bit 8: Enter spindle chuck data in the program

0: The spindle chuck data are taken from the corresponding input screen in the parameter area.

1: Enter spindle chuck data in the program

Bit 9: Additional entry of tailstock data in the program

0: The tailstock data are taken from the spindle chuck data in the parameter area.

1: Additional entry of tailstock data in the program

This bit is only effective if bit 8 is also set.

Bit 10: Enable convex thread

0: Convex thread not enabled with longitudinal thread cutting

1: Convex thread enabled with longitudinal thread cutting

Bit 11: Reserved

Bit 12: Deactivate thread synchronization

0: Thread synchronization is possible

1: Deactivate the thread synchronization function

The operator screenform to set the synchronization point is not displayed, and in the thread cycles

the thread first cut is not calculated with the synchronization point.

Bit 13: Stock removal along the contour with CYCLE95 (828D programGUIDE without Advanced Technology)

0: The screenform for CYCLE952 is opened with the softkey contour turning/stock removal.

2.5 Machine and setting data cycles

1: The screenform for CYCLE95 is opened with the softkey contour turning/stock removal.

Secondary conditions:

- 828D
- programGUIDE
- Without Advanced Technology option

52229	ENABLE_QUICK_M_CODES	-	-
-	Enable fast M functions	BYTE	Immediately
-			
-	-	0	-

Description: Enable fast M functions
 Bit 0: Coolant OFF
 Bit 1: Coolant 1 ON
 Bit 2: Coolant 2 ON
 Bit 3: Coolant 1 and 2 ON

52230	M_CODE_ALL_COOLANTS_OFF	-	-
-	M code for all coolants OFF	DWORD	Immediately
-			
-	-	9	0

Description: M code for all coolants OFF

52231	M_CODE_COOLANT_1_ON	-	-
-	M code for coolant 1 ON	DWORD	Immediately
-			
-	-	8	0

Description: M code for coolant 1 ON

52232	M_CODE_COOLANT_2_ON	-	-
-	M code for coolant 2 ON	DWORD	Immediately
-			
-	-	7	0

Description: M code for coolant 2 ON

52233	M_CODE_COOLANT_1_AND_2_ON	-	-
-	M code for both coolants ON	DWORD	Immediately
-			
-	-	-1	-1

Description: M code for coolant 1 + 2 ON

52240	NAME_TOOL_CHANGE_PROG	-	-
-	Tool change program for G code steps	STRING	Immediately
-			
-	-	-	-

Description: Tool change program for G code steps.
 When inserting a tool using the "Select tool" softkey, the T command is transferred into the program.

If the MD contains a text, this is automatically inserted as an autonomous block after the T command.

For example, the tool change command "M6" can be entered here or a machine-manufacturer specific tool change program.

52241	TOOL_CHANGE_POS_Y	-	-
mm	Tool change position Y in the Machine (ShopTurn)	DOUBLE	Immediately
-			
-	-	0	-
-	-	-	7/3
-	-	-	M

Description: Tool change position Y in Machine (ShopTurn)
In ShopTurn, the tool change point in X and Z can be specified in the Machine or Work.
When the tool change point is approached, the Y axis is simultaneously traversed to the value in the Machine specified in this MD.

52242	TURN_TOOL_FIXING	-	-
-	Tool adapter for turning tools	BYTE	PowerOn
-			
-	-	0	0
-	-	2	7/3
-	-	-	M

Description: Tool adapter for turning tools:
0 = turning tool in the tool spindle
1 = turning tool fixed at the tool spindle box
2 = turning tool in the tool spindle or fixed at the tool spindle box

52244	SUB_SPINDLE_PARK_POS_Y	-	-
mm	Parking position of the Y axis with counterspindle in the Machine	DOUBLE	Immediately
-			
-	-	0	-
-	-	-	7/3
-	-	-	U

Description: Parking position of the Y axis with counterspindle in the Machine

52248	REV_2_BORDER_TOOL_LENGTH	-	-
mm	Limit value tool length X for 2nd turret	DOUBLE	Immediately
-			
-	-	0	-
-	-	-	7/3
-	-	-	M

Description: Limit value of tool length X for the 2nd turret:
Limit value = 0: only one turret available
Tool length X < limit value: tool belongs to 1st turret/multifix
Tool length X >= limit value: tool belongs to 2nd turret/multifix

52250	M_CODE_CHUCK_OPEN	-	-
-	M code for Open chuck with non-rotating spindle	STRING	Immediately
-			
-	2	-	-
-	-	-	7/3
-	-	-	M

Description: M code for Open chuck with non-rotating spindle.
Example: "M34" or "M1=34"
Elements:
[0]: Main spindle
[1]: Counterspindle

2.5 Machine and setting data cycles

52251	M_CODE_CHUCK_OPEN_ROT	-	-
-	M code for Open chuck with rotating spindle	STRING	Immediately
-			
-	2	-	-

Description: M code for Open chuck with rotating spindle.

Example: "M34" or "M1=34"

Elements:

[0]: Main spindle

[1]: Counterspindle

52252	M_CODE_CHUCK_CLOSE	-	-
-	M code for Close chuck	STRING	Immediately
-			
-	2	-	-

Description: M code for Close chuck

Example: "M34" or "M1=34"

Elements:

[0]: Main spindle

[1]: Counterspindle

52253	M_CODE_TAILSTOCK_FORWARD	-	-
-	M code for quill forward	STRING	Immediately
-			
-	2	-	-

Description: M code for quill forward.

E.g.: "M55" or "M1=55"

Elements:

[0]: Quill opposite main spindle

[1]: Quill opposite counterspindle

52254	M_CODE_TAILSTOCK_BACKWARD	-	-
-	M code for quill backward	STRING	Immediately
-			
-	2	-	-

Description: M code for quill backward.

E.g.: "M54" or "M1=54"

Elements:

[0]: Quill opposite main spindle

[1]: Quill opposite counterspindle

52260	MACHINE_JOG_INTERRUPT_PRIO	-	-
-	Priority for start ASUB under machine JOG	BYTE	Immediately
-			
-	-	1	1

Description: Priority for start ASUB under machine JOG

52270	TM_FUNCTION_MASK	-	-
-	Function mask for tool management	DWORD	PowerOn
-			
-	-	0	-
-	-	-	-
-	-	7/3	M

Description:

Function mask for tool management

Bit 0: Create tool on magazine location not allowed. Tools can only be created outside the magazine.

Bit 1: Load/unload disabled if machine is not in reset. Tools can only be loaded/unloaded if the appropriate channel is in reset state.

Bit 2: Load/unload disabled on emergency stop. Tools can only be loaded/unloaded if emergency stop is not active.

Bit 3: Load/unload or relocate tool to/from buffer is disabled. Tools cannot be loaded/ unloaded or relocated in the buffer (spindle/gripper).

Bit 4: Loading is executed directly into the spindle. Tools are loaded exclusively directly into the spindle.

Bit 5: Use grinding configuration file for creating the tool lists. Only grinding tools are offered.

Bit 6: Relocating a tool to/from the buffer (spindle/gripper) is permitted despite a block (see bit3).

Bit 7: Create tool using the tool number. Specify the tool's T number when creating the tool.

Bit 8: Hide Relocate tool. The function 'Relocate tool' is hidden on the user interface.

Bit 9: Hide Position magazine. The function 'Position magazine' is hidden on the user interface.

Bit 10: Reactivate tool using Position magazine. Prior to reactivation, the tool is positioned on the loading position.

Bit 11: Reactivate tool in all monitoring modes. When reactivating a tool, all monitoring modes enabled in the NC are

reactivated for this tool, even the monitoring modes, which have not been set for the relevant tool, but are available in the background only.

Bit 12: Hide Reactivate tool. The function 'Reactivate tool' is hidden on the user interface.

52271	TM_MAG_PLACE_DISTANCE	-	-
mm	Distance betw. indiv. magazine locations	DOUBLE	PowerOn
-			
-	-	70	0
-	-	10000	7/3
-	-	M	

Description:

Distance between individual magazine locations.

Is used for graphical display of magazine and tools in tool management.

52272	TM_TOOL_LOAD_DEFAULT_MAG	-	-
-	Default magazine for tool loading	BYTE	PowerOn
-			
-	-	0	0
-	-	30	7/3
-	-	M	

Description:

Default magazine for tool loading

0 = no default magazine

2.5 Machine and setting data cycles

52273	TM_TOOL_MOVE_DEFAULT_MAG	-	-
-	Default magazine for tool relocation	BYTE	PowerOn
-			
-	-	0	0
		30	7/3
			M

Description: Default magazine for tool relocation
0 = no default magazine

52274	TM_TOOL_LOAD_STATION	-	-
-	Number of load station	BYTE	PowerOn
-			
-	-	0	0
		16	7/3
			M

Description: Number of the loading station
0 = All configured stations are taken into account

52281	TOOL_MCODE_FUNC_ON	-	-
-	M code for tool-specific function ON	DWORD	Immediately
-			
-	4	-1, -1, -1, -1	-1
		32767	7/3
			M

Description: M code for tool-specific function ON
Value -1 means that the M function is not output. If both M commands of a function equal -1, the corresponding field will not be displayed in the user interface

52282	TOOL_MCODE_FUNC_OFF	-	-
-	M code for tool-specific function OFF	DWORD	Immediately
-			
-	4	-1, -1, -1, -1	-1
		32767	7/3
			M

Description: M code for tool-specific function OFF
Value -1 means that the M function is not output. If both M commands of a function equal -1, the corresponding field will not be displayed in the user interface

52290	SIM_DISPLAY_CONFIG	-	-
-	Location of status display of the channel in the simulation (OP019 only)	BYTE	Immediately
-			
-	-	0x0F	-
		-	7/3
			M

Description: Location of status display of the channel in the simulation
Only one of the 4 corners can be selected:
Bit 0 = Top left corner
Bit 1 = Top right corner
Bit 2 = Bottom left corner
Bit 3 = Bottom right corner
This MD is active only on the OP019.

52500	IPT_TRAFO	-	-
-	Transformation number for interpolation turning	BYTE	Immediately
-			
-	-	0	-
		-	7/7
			M

Description: Number of transformation used for interpolation turning with CYCLE806.

52740	MEA_FUNCTION_MASK			-	-	
-	Function mask for measuring cycles, workpiece and tool measuring			DWORD	Immediately	
-						
-	-	65536	-	-	7/3	M

Description: Function mask for measuring cycles

Bit 0: Workpiece measurement, probe input

0: Workpiece probe connected to probe input 1

1: Workpiece probe connected to probe input 2

Bit 1: Workpiece measurement, turning technology, use of a third geometry axis (Y axis) in turning technology by the turning measurement cycles.

0: No use or support of the Y axis.

1: Default values for the turning measuring cycles refer to the Y axis.

This means that the Y axis can be used as a measuring or bypassing axis by the turning measuring cycles.

The tool length or work offset is always corrected in the components of the second geometry axis (X axis) during measurement in the Y axis.

Note: The default values for the Y axis are related to the diameter.

Bit 2: Correction angle is calculated with/without orientation transformation

0: Correction angle (_MEA_CORR_ANGLE[1]) is calculated only with an active orientation transformation(TCARR, CYCLE800 or TRAORI)

1: Correction angle (_MEA_CORR_ANGLE[1]) is calculated even without an active orientation transformation

and SD42940 \$SC_TOOL_LENGTH_CONST 1000s digit = 1 (calculation of tool orientation) is set

Bit 16: Tool measurement, probe input

0: Tool probe connected to probe input 1

1: Tool probe connected to probe input 2

Bit 17: Tool measurement turning, recoding of the cutting edge positions

0: No recoding

1: Internal recoding, cutting edge positions mirrored on the X axis

Tool turret rotated through 180°, Z axis not mirrored

52750	J_MEA_FIXPOINT			-	-	
mm	Z value for measuring fixed point			DOUBLE	Immediately	
-						
-	-	0	-	-	7/3	I

Description: Z value for measuring against fixed point

52751	J_MEA_MAGN_GLAS_POS			-	-	
mm	Zoom-in position for tool measurement			DOUBLE	Immediately	
-						
-	2	0	-	-	7/3	M

Description: Zoom-in position for tool measurement

[0] = Position in the 1st axis

[1] = Position in the 2nd axis

2.5 Machine and setting data cycles

52780	J_MEA_T_PROBE_APPR_MODE	-	-
-	Approach mode tool measurement in JOG	BYTE	Immediately
-			
-	-	0	0
-	-	2	7/3
-	-	M	

Description: Approach mode tool measurement in JOG
 =0: technology-dependent approach to the tool probe
 Turning technology: manual approach
 Milling technology : automatic approach
 =1: technology independent approach to the tool probe
 Manual approach to the tool probe
 =2: technology-independent approach to the tool probe
 Automatic approach to the tool probe

52800	ISO_M_ENABLE_POLAR_COORD	-	-
-	Polar coordinates	BYTE	Immediately
-			
-	-	0	0
-	-	1	7/3
-	-	M	

Description: Polar coordinates
 0: OFF
 1: ON

52802	ISO_ENABLE_INTERRUPTS	-	-
-	Interrupt process	BYTE	Immediately
-			
-	-	0	0
-	-	1	7/3
-	-	M	

Description: Interrupt process
 0: OFF
 1: ON

52804	ISO_ENABLE_DRYRUN	-	-
-	Machining skipped at DRYRUN	BYTE	Immediately
-			
-	-	0	0
-	-	1	7/3
-	-	M	

Description: Maching skipped during tapping G74/G84 at DRYRUN
 0: OFF
 1: ON

52806	ISO_SCALING_SYSTEM	-	-
-	Basic system	BYTE	Immediately
-			
-	-	0	0
-	-	2	7/7
-	-	M	

Description: Basic system:
 0: not defined
 1: METRIC
 2: INCH

52808	ISO_SIMULTAN_AXES_START	-	-
-	Simultaneous approach to the boring position on all programmed axes	BYTE	Immediately
-			
-	-	0	0
-	-	1	7/3
-	-	M	

Description: Simultaneous approach to the boring position on all programmed axes
0: OFF
1: ON

52810	ISO_T_DEEPTHOLE_DRILL_MODE	-	-
-	Deep hole drilling with chipbreaking/stock removal	BYTE	Immediately
-			
-	-	0	0
-	-	1	7/3
-	-	M	

Description: Select the type of deep hole drilling
0: deep hole drilling with chipbreaking
1: deep hole drilling with stock removal

52818	ISO_M_FUNCTION_MASK	-	-
-	Function mask for ISO milling mode	DWORD	Immediately
-			
-	-	0	-
-	-	7/3	M

Description: Function mask for ISO milling mode

52819	ISO_T_FUNCTION_MASK	-	-
-	Function mask for ISO turning mode	DWORD	Immediately
-			
-	-	0	-
-	-	7/3	M

Description: Function mask for ISO turning mode

52840	GRIND_FUNCTION_MASK	-	-
-	Function mask for grinding	DWORD	Immediately
-			
-	-	0	-
-	-	7/3	M

Description: Function mask for grinding
Bit 7: Retraction while profiling with G1
0: Retraction while profiling with rapid traverse (G0)
1: Retraction while profiling with feedrate (G1)

52842	GRIND_DIAMETER_LENGTH	-	-
-	Number of diameter length	BYTE	PowerOn
-			
-	-	1	1
-	-	2	7/3
-	-	M	

Description: Grinding technology: Number of the tool length for the grinding wheel diameter:
1: Length 1 is grinding wheel diameter
2: Length 2 is grinding wheel diameter

2.5 Machine and setting data cycles

52843	GRIND_WIDTH_LENGTH	-	-
-	Number of grinding wheel width	BYTE	PowerOn
-			
-	-	2	1
-	-	2	7/3
-	-	2	M

Description: Grinding technology: Number of the tool length for the grinding wheel width:
 1: Length 1 is grinding wheel width
 2: Length 2 is grinding wheel width

53030	AXIS_MAX_POWER	-	-
%	Maximum value of axis power rating display	DWORD	PowerOn
-			
-	-	100	0
-	-	255	4/3
-	-	255	M

Description: Maximum value of permissible axis power rating in percent.
 The display bar is shown green in the range between 0 and the value of AXIS_MAX_POWER.

53031	AXIS_POWER_RANGE	-	-
%	Display range of axis power rating display	DWORD	PowerOn
-			
-	-	100	0
-	-	255	4/3
-	-	255	M

Description: Scale end value for the axis power display as a percentage. The value must be greater than or equal to AXIS_MAX_POWER.
 The bar display is shown red in the area between the values of AXIS_MAX_POWER and AXIS_POWER_RANGE.

53220	AXIS_MCS_POSITION	-	-
mm	Position of axis in the Machine	DOUBLE	Immediately
-			
-	3	0	-
-	-	-	7/3
-	-	-	M

Description: Position of axis in the Machine:
 The 3 field elements specify the position in X, Y, Z.
 For linear axes, the value corresponds to the zero point of the axis in the Machine.
 For rotary axes, the position of the rotary axis is defined in the Machine.

53230	SIM_START_POSITION	-	-
mm, degrees	Axis position at start of simulation	DOUBLE	Immediately
-			
-	-	0	-
-	-	-	7/3
-	-	-	M

Description: Axis position at start of simulation
 Simulation is only possible if a value not equal to 0 has been set for at least one geometry axis.

53240	SPINDLE_PARAMETER	-	-
mm	Spindle chuck data	DOUBLE	Immediately
-			
-	3	0	-
-	-	-	7/7
-	-	-	U

Description: Spindle chuck data:
 [0]: Chuck dimension
 [1]: Stop dimension

[2]: Jaw dimension

53241	SPINDLE_CHUCK_TYPE	-	-
-	Spindle jaw type	BYTE	Immediately
-			
-	-	0	-
-	-	-	-
-	-	7/7	U

Description: Spindle jaw type:
0 = Clamping from outside
1 = Clamping from inside

53242	TAILSTOCK_PARAMETER	-	-
mm	Tailstock data	DOUBLE	Immediately
-			
-	2	0	-
-	-	-	-
-	-	7/7	M

Description: Tailstock data:
[0]: Tailstock diameter
[1]: Tailstock length

53250	CLAMPING_TOLERANCE	-	-
mm, degrees	Permissible tolerance when an axis jams	DOUBLE	Immediately
-			
-	-	0.1	0
-	-	10	7/3
-	-	M	

Description: Permissible tolerance when an axis jams.
When jamming, an axis can be pushed somewhat out of its position.
With this machine data you define up to which tolerance level the axis does not have to be repositioned.

53350	ILC_BASE_VALUE	-	-
-	Basic inertia of the axis	DOUBLE	Immediately
-			
-	-	0	-
-	-	-	-
-	-	7/1	M

Description: Basic inertia of the axis
The result of the determination of the load on the axis without workpiece is stored in this machine data.
This value must be determined once during the machine setup.
It is needed to support the Determine load separately function with the cycle CYCLE782.

54215	TM_FUNCTION_MASK_SET	-	-
-	Function mask for tool management	DWORD	PowerOn
-			
-	-	0	-
-	-	-	-
-	-	7/4	M

Description: Function mask for tool management
Bit 0: Diameter display for rotating tools. It is not the radius value but the diameter that is displayed for rotating tools.
Bit 1: Default direction of rotation for all turning tools is M4. Direction of rotation M4 is assigned by default when turning tools are created.
Bit 2: Create tool without suggesting name.
Bit 3: Input disable for tool name and tool type in the case of loaded tools. Once tools have been loaded, the tool name and the tool type can no longer be changed.
Bit 4: Input disable for loaded tools if the channel is not in reset.

2.5 Machine and setting data cycles

- Bit 5: Accrue tool wear entries additively. Tool wear data entries are added to the existing wear value.
- Bit 6: Entry of tool ID in numerical format. The tool ID may only be entered using numbers.
- Bit 7: Hide tool monitoring parameters. The tool monitoring parameters are hidden on the user interface.
- Bit 8: Diameter display for transverse axis geometry. The geometry value for the transverse axis is displayed as a diameter value.
- Bit 9: Diameter display for transverse axis wear. The wear value for the transverse axis is displayed as a diameter value.
- Bit 10: Enable loading/relocation of tool in buffer locations. The magazine number can be entered in the load dialog box. The magazine number 9998 is then used to access the buffer location.
- Bit 11: Creation of new tools in gripper locations is disabled.
- Bit 12: Measuring tools are not unloaded when the "Unload all" function is executed.
- Bit 13: The wear value is not deleted on entry of a tool geometry value.
- Bit 14: Load or relocate tool. The search for an empty location is made without assignment with the last used magazine.
- 0: The search for an empty location always starts with the last used magazine.
- 1: The search for an empty location follows the set search strategy.

54480	AST_MMC_HANDLER_NAME			-	-	
-	Assignment of an HMI Operate instance for AST commands			STRING	Immediately	
-						
-	-	-	-	-	1/1	M

Description: Name of the assigned HMI Operate (master)
One Operate must be defined as the master.

54481	AST_MMC_DEFAULT_IS_PCU			-	-	
-	Selection of HMI Operate internally (NCU) / externally (PCU) for AST			BOOLEAN	Immediately	
-						
-	-	0	0	1	1/1	M

Description: Selection of HMI Operate internally (NCU) / externally (PCU) for AST
Selection of the Operate type

54600	MEA_WP_BALL_DIAM			-	-	
mm	Effective diameter of the probe sphere for the workpiece probe			DOUBLE	Immediately	
-						
-	40	0, 0, 0, 0, 0, 0, 0, 0...	0	10000	7/7	U

Description: Effective sphere diameter of the probe sphere for the workpiece probe.
The value of this parameter is created by the operation "Calibrate workpiece probe"!

54601	MEA_WP_TRIG_MINUS_DIR_AX1			-	-	
mm	Trigger point of the 1st measuring axis in negative direction			DOUBLE	Immediately	
-						
-	40	0, 0, 0, 0, 0, 0, 0, 0...	-100000	100000	7/7	U

Description: Trigger point of the 1st measuring axis (abscissa) in negative traversing direction (X at G17) of the workpiece probe.
The term "negative traversing direction" refers to the currently active workpiece zero point reference!

The value of this parameter is created by the operation "Calibrate workpiece probe"!

54602	MEA_WP_TRIG_PLUS_DIR_AX1			-	-	
mm	Trigger point of the 1st measuring axis in positive direction			DOUBLE	Immediately	
-						
-	40	0, 0, 0, 0, 0, 0, 0, 0...	-100000	100000	7/7	U

Description: Trigger point of the 1st measuring axis (abscissa) in positive traversing direction (X at G17) of the workpiece probe.
The term "positive traversing direction" refers to the currently active workpiece zero point reference!
The value of this parameter is created by the operation "Calibrate workpiece probe"!

54603	MEA_WP_TRIG_MINUS_DIR_AX2			-	-	
mm	Trigger point of the 2nd measuring axis in negative direction			DOUBLE	Immediately	
-						
-	40	0, 0, 0, 0, 0, 0, 0, 0...	-100000	100000	7/7	U

Description: Trigger point of the 2nd measuring axis (ordinate) in negative traversing direction (Y at G17) of the workpiece probe.
The term "negative traversing direction" refers to the currently active workpiece zero point reference!
The value of this parameter is created by the operation "Calibrate workpiece probe"!

54604	MEA_WP_TRIG_PLUS_DIR_AX2			-	-	
mm	Trigger point of the 2nd measuring axis in positive direction			DOUBLE	Immediately	
-						
-	40	0, 0, 0, 0, 0, 0, 0, 0...	-100000	100000	7/7	U

Description: Trigger point of the 2nd measuring axis (ordinate) in positive traversing direction (Y at G17) of the workpiece probe.
The term "positive traversing direction" refers to the currently active workpiece zero point reference!
The value of this parameter is created by the operation "Calibrate workpiece probe"!

54605	MEA_WP_TRIG_MINUS_DIR_AX3			-	-	
mm	Trigger point of the 3rd measuring axis in negative direction			DOUBLE	Immediately	
-						
-	40	0, 0, 0, 0, 0, 0, 0, 0...	-100000	100000	7/7	U

Description: Trigger point of the 3rd measuring axis (applicate) in negative traversing direction (Z at G17) of the workpiece probe.
The term "negative traversing direction" refers to the currently active workpiece zero point reference!
The value of this parameter is created by the operation "Calibrate workpiece probe"!

54606	MEA_WP_TRIG_PLUS_DIR_AX3			-	-	
mm	Trigger point of the 3rd measuring axis in positive direction			DOUBLE	Immediately	
-						
-	40	0, 0, 0, 0, 0, 0, 0, 0...	-100000	100000	7/7	U

Description: Trigger point of the 3rd measuring axis (applicate) in positive traversing direction (Z at G17) of the workpiece probe.
The term "positive traversing direction" refers to the currently active workpiece zero point reference!
The value of this parameter is created by the operation "Calibrate workpiece probe"!

2.5 Machine and setting data cycles

54607	MEA_WP_POS_DEV_AX1	-	-
mm	Position deviation of the probe sphere in the 1st measuring axis	DOUBLE	Immediately
-			
-	40	0, 0, 0, 0, 0, 0, 0, 0...	-100000 100000 7/7 U

Description: The position deviation in the 1st measuring axis represents a geometrical offset of the center point of the probe sphere related to the electrical center point of the probe in this axis!
The value of this parameter is created by the operation "Calibrate workpiece probe"!

54608	MEA_WP_POS_DEV_AX2	-	-
mm	Position deviation of the probe sphere in the 2nd measuring axis	DOUBLE	Immediately
-			
-	40	0, 0, 0, 0, 0, 0, 0, 0...	-100000 100000 7/7 U

Description: The position deviation in the 2nd measuring axis represents a geometrical offset of the center point of the probe sphere related to the electrical center point of the probe in this axis!
The value of this parameter is created by the operation "Calibrate workpiece probe"!

54609	MEA_WP_STATUS_RT	-	-
-	Calibration status axis positions	DOUBLE	Immediately
-			
-	40	0, 0, 0, 0, 0, 0, 0, 0...	- - 7/7 U

Description: Calibration status of the axis positions reserved for internal use!
The value of this parameter is created by the operation "Calibrate workpiece probe"!

54610	MEA_WP_STATUS_GEN	-	-
-	Calibration status in general	DOUBLE	Immediately
-			
-	40	0, 0, 0, 0, 0, 0, 0, 0...	- - 7/7 U

Description: Calibration status in general reserved for internal use!
The value of this parameter is created by the operation "Calibrate workpiece probe"!

54611	MEA_WP_FEED	-	-
mm/min	Measuring feed for calibration	DOUBLE	Immediately
-			
-	40	0, 0, 0, 0, 0, 0, 0, 0...	0 100000 7/7 U

Description: Measure workpiece measuring feed for calibration
This measuring feed is used for all subsequent workpiece measuring programs in conjunction with the probe field.

54615	MEA_CAL_EDGE_BASE_AX1	-	-
mm	Calibration groove base of the 1st measuring axis	DOUBLE	Immediately
-			
-	3	0, 0, 0	-100000 100000 7/7 U

Description: Calibration groove base of the 1st measuring axis (abscissa, Z at G18)
This parameter is a geometrical component of the calibration groove and must be supplied by the user!

54617	MEA_CAL_EDGE_PLUS_DIR_AX1			-	-	
mm	Calibration groove edge in positive direction of the 1st measuring axis			DOUBLE	Immediately	
-						
-	3	0, 0, 0	-100000	100000	7/7	U

Description: Calibration groove edge in positive direction of the 1st measuring axis (abscissa, Z at G18)
This parameter is a geometrical component of the calibration groove and must be supplied by the user!

54618	MEA_CAL_EDGE_MINUS_DIR_AX1			-	-	
mm	Calibration groove edge in negative direction of the 1st measuring axis			DOUBLE	Immediately	
-						
-	3	0, 0, 0	-100000	100000	7/7	U

Description: Calibration groove edge in negative direction of the 1st measuring axis (abscissa, Z at G18)
This parameter is a geometrical component of the calibration groove and must be supplied by the user!

54619	MEA_CAL_EDGE_BASE_AX2			-	-	
mm	Calibration groove base of the 2nd measuring axis			DOUBLE	Immediately	
-						
-	3	0, 0, 0	-100000	100000	7/7	U

Description: Calibration groove base of the 2nd measuring axis (ordinate, X at G18)
This parameter is a geometrical component of the calibration groove and must be supplied by the user!

54620	MEA_CAL_EDGE_UPPER_AX2			-	-	
mm	Calibration groove upper edge of the 2nd measuring axis			DOUBLE	Immediately	
-						
-	3	0, 0, 0	-100000	100000	7/7	U

Description: Calibration groove upper edge of the 2nd measuring axis (ordinate, X at G18)
This parameter is a geometrical component of the calibration groove and must be supplied by the user!

54621	MEA_CAL_EDGE_PLUS_DIR_AX2			-	-	
mm	Calibration groove edge in positive direction of the 2nd measuring axis			DOUBLE	Immediately	
-						
-	3	0, 0, 0	-100000	100000	7/7	U

Description: Calibration groove edge in positive direction of the 2nd measuring axis (ordinate, X at G18)
This parameter is a geometrical component of the calibration groove and must be supplied by the user!

2.5 Machine and setting data cycles

54622	MEA_CAL_EDGE_MINUS_DIR_AX2			-	-	
mm	Calibration groove edge in negative direction of the 2nd measuring axis			DOUBLE	Immediately	
-						
-	3	0, 0, 0	-100000	100000	7/7	U

Description: Calibration groove edge in negative direction of the 2nd measuring axis (ordinate, X at G18)
This parameter is a geometrical component of the calibration groove and must be supplied by the user!

54625	MEA_TP_TRIG_MINUS_DIR_AX1			-	-	
mm	Trigger point of the 1st measuring axis in negative direction			DOUBLE	Immediately	
-						
-	6	0, 0, 0, 0, 0, 0	-100000	100000	7/7	U

Description: Trigger point of the 1st measuring axis in negative direction (abscissa, X at G17, Z at G18)
The trigger point refers to the machine coordinate system (Machine).
Prior to calibration the approximate trigger point must be entered in the machine coordinate system!
The exact value of this parameter is created by the operation "Calibrate workpiece probe"!

54626	MEA_TP_TRIG_PLUS_DIR_AX1			-	-	
mm	Trigger point of the 1st measuring axis in positive direction			DOUBLE	Immediately	
-						
-	6	0, 0, 0, 0, 0, 0	-100000	100000	7/7	U

Description: Trigger point of the 1st measuring axis in positive direction (abscissa, X at G17, Z at G18)
The trigger point refers to the machine coordinate system (Machine).
Prior to calibration the approximate trigger point must be entered in the machine coordinate system!
The exact value of this parameter is created by the operation "Calibrate workpiece probe"!

54627	MEA_TP_TRIG_MINUS_DIR_AX2			-	-	
mm	Trigger point of the 2nd measuring axis in negative direction			DOUBLE	Immediately	
-						
-	6	0, 0, 0, 0, 0, 0	-100000	100000	7/7	U

Description: Trigger point of the 2nd measuring axis in negative direction (ordinate, Y at G17, X at G18)
The trigger point refers to the machine coordinate system (Machine).
Prior to calibration the approximate trigger point must be entered in the machine coordinate system!
The exact value of this parameter is created by the operation "Calibrate workpiece probe"!

54628	MEA_TP_TRIG_PLUS_DIR_AX2			-	-	
mm	Trigger point of the 2nd measuring axis in positive direction			DOUBLE	Immediately	
-						
-	6	0, 0, 0, 0, 0, 0	-100000	100000	7/7	U

Description: Trigger point of the 2nd measuring axis in positive direction (ordinate, Y at G17, X at G18)
 The trigger point refers to the machine coordinate system (Machine).
 Prior to calibration the approximate trigger point must be entered in the machine coordinate system!
 The exact value of this parameter is created by the operation "Calibrate workpiece probe"!

54629	MEA_TP_TRIG_MINUS_DIR_AX3	-	-
mm	Trigger point of the 3rd measuring axis in negative direction	DOUBLE	Immediately
-			
-	6	0, 0, 0, 0, 0, 0	-100000 100000 7/7 U

Description: Trigger point of the 3rd measuring axis in negative direction (applicate, Z at G17, Y at G18)
 The trigger point refers to the machine coordinate system (Machine).
 Prior to calibration the approximate trigger point must be entered in the machine coordinate system!
 The exact value of this parameter is created by the operation "Calibrate workpiece probe"!

54630	MEA_TP_TRIG_PLUS_DIR_AX3	-	-
mm	Trigger point of the 3rd measuring axis in positive direction	DOUBLE	Immediately
-			
-	6	0, 0, 0, 0, 0, 0	-100000 100000 7/7 U

Description: Trigger point of the 3rd measuring axis in positive direction (ordinate, Y at G17, X at G18)
 The trigger point refers to the machine coordinate system (Machine).
 Prior to calibration, the approximate trigger point must be entered in the machine coordinate system!
 The exact value of this parameter is created by the operation "Calibrate tool probe"!

54631	MEA_TP_EDGE_DISK_SIZE	-	-
mm	Tool probe edge length/wheel diameter	DOUBLE	Immediately
-			
-	6	0, 0, 0, 0, 0, 0	0 1000 7/7 U

Description: Effective edge length or grinding wheel diameter of the tool probe.
 This data is important for the "Milling" technology when measuring the length of milling tools.

54632	MEA_TP_AX_DIR_AUTO_CAL	-	-
-	Automatic tool probe calibration, enable axes/directions	DWORD	Immediately
-			
-	6	133, 133, 133, 133, 133, 133	- - 7/7 U

Description: Enabling axes and traversing directions for the "Automatic calibration" of milling tool probes in the machine coordinate system (Machine).
 The default setting refers in X and Y to the plus and minus directions respectively, in Z only to the minus direction.
 The parameter is divided into six components, the functions of which are assigned to calibration data records 1 to 6.
 Meaning of the parameter components
 Decimal position:

2.5 Machine and setting data cycles

Units 1st geometry axis (X)
 Tens: 2nd geometry axis (Y)
 Hundreds: 3rd geometry axis (Z)
 Value:
 =0: axis not enabled
 =1: only minus direction possible
 =2: only plus direction possible
 =3: both directions possible

54633	MEA_TP_TYPE			-	-	
-	Tool probe type cube / wheel / probe head			DOUBLE	Immediately	
-						
-	6	0, 0, 0, 0, 0, 0	0	999	7/7	U

Description: Tool probe type
 0: Compatibility (measuring cycles: cube, turning surface shows probe head, milling surface shows wheel)
 101: Wheel in XY, working plane G17
 201: Wheel in ZX, working plane G18
 301: Wheel in YZ, working plane G19
 2: Probe head
 3: Cube

54634	MEA_TP_CAL_MEASURE_DEPTH			-	-	
mm	Distance between the upper tool probe edge and the lower milling tool edge			DOUBLE	Immediately	
-						
-	6	2, 2, 2, 2, 2	-1000	1000	7/7	U

Description: Distance between the upper tool probe edge and the lower milling tool edge.
 For tool probe calibration this distance defines the calibration depth and
 for milling tool measuring the measuring depth!
 This parameter does not apply to turning tool measuring!

54635	MEA_TP_STATUS_GEN			-	-	
-	Calibration status in general			DOUBLE	Immediately	
-						
-	6	0, 0, 0, 0, 0, 0	-	-	7/7	U

Description: Calibration status general, reserved for internal use
 The value of this parameter is assigned when the "Calibrate tool probe" procedure is executed.

54636	MEA_TP_FEED			-	-	
mm/min	Measuring feed for tool probe calibration in the Machine			DOUBLE	Immediately	
-						
-	6	0, 0, 0, 0, 0, 0	0	100000	7/7	U

Description: Measuring feed for tool probe calibration in Machine
 This measuring feed is used for all subsequent tool measuring programs in conjunction with the probe field.

54640	MEA_TPW_TRIG_MINUS_DIR_AX1	-	-
mm	Trigger point of the 1st measuring axis in negative direction	DOUBLE	Immediately
-			
-	6	0, 0, 0, 0, 0, 0	-100000 100000 7/7 U

Description: Trigger point of the 1st measuring axis in negative direction (abscissa, X at G17, Z at G18)
The trigger point refers to the workpiece coordinate system (Work).
Prior to calibration the approximate trigger point must be entered in the workpiece coordinate system!
The exact value of this parameter is created by the operation "Calibrate tool probe"!

54641	MEA_TPW_TRIG_PLUS_DIR_AX1	-	-
mm	Trigger point of the 1st measuring axis in positive direction	DOUBLE	Immediately
-			
-	6	0, 0, 0, 0, 0, 0	-100000 100000 7/7 U

Description: Trigger point of the 1st measuring axis in positive direction (abscissa, X at G17, Z at G18)
The trigger point refers to the workpiece coordinate system (Work).
Prior to calibration the approximate trigger point must be entered in the workpiece coordinate system!
The exact value of this parameter is created by the operation "Calibrate tool probe"!

54642	MEA_TPW_TRIG_MINUS_DIR_AX2	-	-
mm	Trigger point of the 2nd measuring axis in negative direction	DOUBLE	Immediately
-			
-	6	0, 0, 0, 0, 0, 0	-100000 100000 7/7 U

Description: Trigger point of the 2nd measuring axis in negative direction (ordinate, Y at G17, X at G18)
The trigger point refers to the workpiece coordinate system (Work).
Prior to calibration the approximate trigger point must be entered in the workpiece coordinate system!
The exact value of this parameter is created by the operation "Calibrate tool probe"!

54643	MEA_TPW_TRIG_PLUS_DIR_AX2	-	-
mm	Trigger point of the 2nd measuring axis in positive direction	DOUBLE	Immediately
-			
-	6	0, 0, 0, 0, 0, 0	-100000 100000 7/7 U

Description: Trigger point of the 2nd measuring axis in positive direction (ordinate, Y at G17, X at G18)
The trigger point refers to the workpiece coordinate system (Work).
Prior to calibration the approximate trigger point must be entered in the workpiece coordinate system!
The exact value of this parameter is created by the operation "Calibrate tool probe"!

54644	MEA_TPW_TRIG_MINUS_DIR_AX3	-	-
mm	Trigger point of the 3rd measuring axis in negative direction	DOUBLE	Immediately
-			
-	6	0, 0, 0, 0, 0, 0	-100000 100000 7/7 U

Description: Trigger point of the 3rd measuring axis in negative direction (applicate, Z at G17, Y at G18)

2.5 Machine and setting data cycles

The trigger point refers to the workpiece coordinate system (Work).

Prior to calibration the approximate trigger point must be entered in the workpiece coordinate system!

The exact value of this parameter is created by the operation "Calibrate tool probe"!

54645	MEA_TPW_TRIG_PLUS_DIR_AX3			-	-	
mm	Trigger point of the 3rd measuring axis in positive direction			DOUBLE	Immediately	
-						
-	6	0, 0, 0, 0, 0, 0	-100000	100000	7/7	U

Description: Trigger point of the 3rd measuring axis in positive direction (aplicate, Z at G17, Y at G18)

The trigger point refers to the workpiece coordinate system (Work).

Prior to calibration the approximate trigger point must be entered in the workpiece coordinate system!

The exact value of this parameter is created by the operation "Calibrate tool probe"!

54646	MEA_TPW_EDGE_DISK_SIZE			-	-	
mm	Tool probe edge length/wheel diameter			DOUBLE	Immediately	
-						
-	6	0, 0, 0, 0, 0, 0	0	1000	7/7	U

Description: Effective edge length or grinding wheel diameter of the tool probe.

Milling tools are normally measured with wheel-shaped probes while turning tools are measured with square probes.

54647	MEA_TPW_AX_DIR_AUTO_CAL			-	-	
-	Automatic tool probe calibration, enable axes/directions			DWORD	Immediately	
-						
-	6	133, 133, 133, 133, 133, 133	-	-	7/7	U

Description: Enabling axes and traversing directions for "Automatic calibration" in the workpiece coordinate system (Work) of milling tool probes.

The default setting refers in X and Y to the plus and minus direction respectively, in Z only to the minus direction.

The parameter is divided into six components, the functions of which are assigned to calibration data records 1 to 6.

Meaning of the parameter components

Decimal position:

Units 1st geometry axis (X)

Tens: 2nd geometry axis (Y)

Hundreds: 3rd geometry axis (Z)

Value:

=0: axis not enabled

=1: only minus direction possible

=2: only plus direction possible

=3: both directions possible

54648	MEA_TPW_TYPE			-	-	
-	Tool probe type cube / wheel / probe head			DOUBLE	Immediately	
-						
-	6	0, 0, 0, 0, 0, 0	-	-	7/7	U

Description:

Tool probe type

0: Compatibility (measuring cycles: cube, turning interface shows probe head, milling interface shows disc)

101: Disk in XY, working plane G17

201: Disk in ZX, working plane G18

301: Disk in YZ, working plane G19

2: Probe head

3: Cube

54649	MEA_TPW_CAL_MEASURE_DEPTH	-	-
mm	Distance between the upper tool probe edge and the lower milling tool edge	DOUBLE	Immediately
-			
-	6	2, 2, 2, 2, 2, 2	0 999 7/7 U

Description:

Distance between the upper tool probe edge and the lower milling tool edge.

For tool probe calibration this distance defines the calibration depth and for milling tool measuring the measuring depth!

This parameter does not apply to turning tool measuring!

54650	MEA_TPW_STATUS_GEN	-	-
-	Calibration status in general	DOUBLE	Immediately
-			
-	6	0, 0, 0, 0, 0, 0	- - 7/7 U

Description:

Calibration status general, reserved for internal use

The value of this parameter is assigned when the "Calibrate tool probe" procedure is executed.

54651	MEA_TPW_FEED	-	-
mm/min	Measuring feed for tool probe calibration in the Work	DOUBLE	Immediately
-			
-	6	0, 0, 0, 0, 0, 0	0 100000 7/7 U

Description:

Measuring feed for tool probe calibration in Work

This measuring feed is used for all subsequent tool measuring programs in conjunction with the probe field.

54652	MEA_INPUT_TOOL_PROBE_SUB	-	-
-	Tool probe available/active on the counterspindle	BYTE	Immediately
-			
-	6	0, 0, 0, 0, 0, 0	0 11 7/2 I

Description:

CNC measurement input for tool probe with reference to the counterspindle

\$SNS_MEA_INPUT_TOOL_PROBE_SUB[[n]

=0: Toolsetter no.= n+1, with reference to the main spindle,

CNC measurement input corresponds to the value of \$MCS_MEA_FUNCTION_MASK, bit16
(Input values 1 to 9 have the same functional effect as input 0!)

=10: Toolsetter no.= n+1, with reference to the counterspindle,
units digit =0 corresponds to CNC measurement input 1

=11: Toolsetter no.= n+1, with reference to the counterspindle,
units digit =1 corresponds to CNC measurement input 2

2.5 Machine and setting data cycles

54670	MEA_CM_MAX_PERI_SPEED	-	-
m/min	Max. permissible peripheral speed of the tool to be measured	DOUBLE	Immediately
-			
-	2	100, 100	0 10000 7/7 U

Description: Max. permissible peripheral speed of the tool to be measured when the spindle rotates.
Monitoring parameter for tool measuring with rotating spindle

54671	MEA_CM_MAX_REVOLUTIONS	-	-
rev/min	Maximum tool speed for tool measuring	DOUBLE	Immediately
-			
-	2	1000, 1000	0 100000 7/7 U

Description: Max. permissible tool speed for tool measuring with rotating spindle.
The speed is automatically reduced when this value is exceeded.
Monitoring parameter for tool measuring with rotating spindle

54672	MEA_CM_MAX_FEEDRATE	-	-
mm/min	Maximum feed for contact of the tool with the probe	DOUBLE	Immediately
-			
-	2	20, 20	0 100000 7/7 U

Description: Max. permissible feed for contact of the tool to be measured with the probe when the spindle rotates.
Monitoring parameter for tool measuring with rotating spindle

54673	MEA_CM_MIN_FEEDRATE	-	-
mm/min	Minimum feed for 1st contact of the tool with the probe	DOUBLE	Immediately
-			
-	2	1, 1	0 100000 7/7 U

Description: Min. feed for first contact of the tool to be measured with the probe when the spindle rotates.
Too small feeds for large tool radii are thus avoided!
Monitoring parameter for tool measuring with rotating spindle

54674	MEA_CM_SPIND_ROT_DIR	-	-
-	Direction of spindle rotation for tool measuring	DOUBLE	Immediately
-			
-	2	4, 4	3 4 7/7 U

Description: Direction of spindle rotation for tool measuring with rotating spindle (default: 4 = M4)
Notice: if the spindle is already rotating when the measuring cycle is called, the direction of rotation is maintained
independently of \$SNS_MEA_CM_SPIND_ROT_DIR!
Monitoring parameter for tool measuring with rotating spindle

54675	MEA_CM_FEEDFACTOR_1	-	-
-	Feedrate factor 1, for tool measuring	DOUBLE	Immediately
-			
-	2	10, 10	- - 7/7 U

Description: Feedrate factor 1, for tool measuring with rotating spindle

=0: single probing with the feedrate calculated by the cycle (but at least with the value of \$SNS_MEA_CM_MIN_FEEDRATE)

>=1: first probing with calculated feedrate (but at least with the value of \$SNS_MEA_CM_MIN_FEEDRATE).

Monitoring parameter for tool measuring with rotating spindle

54676	MEA_CM_FEEDFACTOR_2	-	-
-	Feedrate factor 2, for tool measuring	DOUBLE	Immediately
-			
-	2	0, 0	-

Description:

Feedrate factor 2, for tool measuring with rotating spindle

=0: second probing with the feedrate calculated by the cycle (only effective with MEA_CM_FEEDFACTOR_1 > 0)

>=1: second probing with calculated feedrate, feedrate factor 2

Third probing with calculated feedrate (tool speed is influenced by SD54749 \$SNS_MEA_FUNCTION_MASK_TOOL, Bit 12)

Notice: - Feedrate factor 2 should be smaller than feedrate factor 1!

- If the value of feedrate factor 2 is 0, a third probing will not be performed!

Monitoring parameter for tool measuring with rotating spindle

54677	MEA_CM_MEASURING_ACCURACY	-	-
mm	Required measuring accuracy, for tool measuring	DOUBLE	Immediately
-			
-	2	0.005, 0.005	0

Description:

Required measuring accuracy for tool measuring

The value of this parameter always refers to the last contact of the tool with the probe!

Monitoring parameter for tool measuring with rotating spindle

54689	MEA_T_PROBE_MANUFACTURER	-	-
-	Tool probe type (manufacturer)	BYTE	Immediately
-			
-	-	0	0

Description:

Tool probe type (manufacturer)

These indications are required for tool measuring with rotating spindle.

=0: no indication

=1: TT130 (Heidenhain)

=2: TS27R (Renishaw)

54691	MEA_T_PROBE_OFFSET	-	-
-	Measurement result offset for tool measuring	BYTE	Immediately
-			
-	-	0	0

Description:

Measurement result offset for tool measuring with rotating spindle.

=0: no offset

=1: cycle-internal offset (only effective with SD54690

\$SNS_MEA_T_PROBE_MANUFACTURER<>0)

=2: offset through user-defined offset table

2.5 Machine and setting data cycles

54692	MEA_T_CIRCULAR_ARC_DIST	-	-
mm	Distance between meas. pts with meas. function "Check teeth individually"	DOUBLE	Immediately
-			
-	-	0.25	0
		5	7/7
			U

Description: The data value is used for measuring the tool radius with the function "Check teeth individually".

The distance (measured at the circumference of the tool) between the points at which measurements are made to find the "highest point on the longest tooth" must be entered. If the data value is ZERO, then the search for the "highest point on the longest tooth" is not made with a stationary spindle, instead the value is measured by sampling while the spindle is rotating.

54693	MEA_T_MAX_STEPS	-	-
-	Max. number of contacts for measuring function "Check teeth individually"	BYTE	Immediately
-			
-	-	10	0
		15	7/7
			U

Description: Maximum number of contacts for finding the "highest point on the longest tooth" when measuring the tool radius.

If the data value is ZERO, then the search for the "highest point on the longest tooth" is not made with a stationary spindle, instead the value is measured by sampling while the spindle is rotating.

54695	MEA_RESULT_OFFSET_TAB_RAD1	-	-
mm	Offset table (measure tool radius with rotating spindle)	DOUBLE	Immediately
-			
-	5	0, 0, 0, 0, 0	-
		-	7/5
			U

Description: Parameter for user-defined measurement result offset for tool measuring with rotating spindle

\$SNS_MEA_RESULT_OFFSET_TAB_RAD1[0]	... this element always has value ZERO
\$SNS_MEA_RESULT_OFFSET_TAB_RAD1[1]	... 1st tool radius
\$SNS_MEA_RESULT_OFFSET_TAB_RAD1[2]	... 2nd tool radius
\$SNS_MEA_RESULT_OFFSET_TAB_RAD1[3]	... 3rd tool radius

54740	MEA_FUNCTION_MASK	-	-
-	Function mask for measuring cycles, workpiece and tool measuring	DWORD	Immediately
-			
-	-	8	-
		-	-
		7/5	U

Description:

Function mask for measuring cycles

Bit 0: Repeat measurement, workpiece measurement with offset in a tool, after tolerance exceeded for dimension difference (TDIF) or confidence range (TSA)

0: When one of the tolerances is exceeded, the measurement is not repeated and an appropriate alarm

is displayed (alarm 61303 or 61306).

1: When one of the tolerances is exceeded, a measurement is repeated up to four times.

When, for all repeat measurements, one of the tolerances is exceeded, then an appropriate alarm is displayed (alarm 61303 or 61306).

Bit 1: Repeat measurement, workpiece measurement with offset in a tool, program stop at M0,

After every repeat measurement with tolerance of dimension difference (TDIF) or confidence range (TSA) exceeded and alarm output

Bit 1 only effective in conjunction with bit 0 = 1.

0: If one of the tolerances is exceeded, the measurement is not repeated and an appropriate alarm

is displayed (alarm 61303 or 61306).

1: If one of the tolerances is exceeded, the measurement is repeated up to four times.

In the case of a tolerance being repeatedly exceeded, using an appropriate alarm output and M0, the measurement is interrupted (alarm 62303 or 62306).

With "NC-START", the alarm can be acknowledged, and the next repeat measurement started.

Bit 2: Workpiece measurement with offset in a tool, programmed stop at M0 after tolerance exceeded

from lower limit workpiece (TLL) or upper limit workpiece (TUL) and alarm output

0: If one of the tolerances is exceeded, an appropriate reset alarm is displayed

(alarm 61304 or 61305). A tool correction (offset) is not executed.

1: If one of the tolerances is exceeded, then using an appropriate alarm output

and M0, the sequence is canceled (alarm 62304 or 62305).

Using "NC-START" these alarms can be acknowledged, and the sequence restarted. The correction (offset) in the tool is executed.

Bit 3: Accept the calibrated radius of the workpiece probe in the tool data

0: Do not accept the calibrated radius of the workpiece probe in the tool data.

1: Accept the calibrated radius of the workpiece probe in the tool data.

Bit 4: For mixed technologies, turning-milling or milling-turning, the plane between calibrating and

measuring can be different.

0: When measuring workpieces, it is not permissible to have different planes for calibration and measurement.

If the planes differ, alarm 61341 is output during the cycle runtime.

1: When measuring workpieces, different planes for calibration and measurement are permissible.

For example: Calibration in G17 and measurement under turning in G18.

Bit 16: Repeat measurement, tool measurement, after tolerances of the dimension difference are exceeded (TDIF)

or confidence range (TSA) exceeded

0: If one of the tolerances is exceeded, the measurement is not repeated, and an appropriate alarm is displayed (alarm 61303 or 61306).

1: When one of the tolerances is exceeded, the measurement is repeated up to four times.

If, for all repeat measurements, one of the tolerances is exceeded, then an appropriate alarm is displayed (alarm 61303 or 61306).

Bit 17: Repeat measurement, tool measurement, programmed stop at M0 after tolerance exceeded, dimension difference (TDIF) or confidence range (TSA) and alarm output

0: If one of the tolerances is exceeded, the measurement is not repeated, and an appropriate alarm is displayed (alarm 61303 or 61306).

1: If one of the tolerances is exceeded, the measurement is repeated up to four times.

In the case that the tolerance is exceeded again, using an appropriate alarm output and M0 measurement is canceled (alarm 62303 or 62306).

Using "NC-START", the alarm can be acknowledged, and the next repeat measurement started.

Bit 19: Tool measurement, milling technology, reducing the spindle speed at the last probing

0: The last probing is realized without reducing the spindle speed.

1: At the last probing, the spindle speed is automatically reduced.

54750	MEA_ALARM_MASK	-	-
-	Expert mode for cycle alarms	DWORD	Immediately
-			
-	-	0	-

Description:

Bit 2: With special transformations (e.g. robot transformations) it may be useful to deactivate the traversing distance reduction of the measurement block related to the software limit positions, and the corresponding alarms.

Bit 3 - 15 Reserved for workpiece measurement

Bit 16: Tool, extended error reaction

=0: No extended error reaction

=1: CUST_MEACYC is called at the end of the measuring cycle before the alarm output

Bit 17: Tool, extended error reaction with the action alarm output

=0: Alarm output

=1: Alarm is not output

Bit 17 is effective only in conjunction with bit 16.

Bits 18-31 Reserved for tool measurement

2.5 Machine and setting data cycles

54760	MEA_FUNCTION_MASK_PIECE			-	-	
-	Setting f. input screen, measuring cycles in Automatic, workpiece measuring			DWORD	Immediately	
-						
-	-	131586	-	-	7/5	U

Description: Setting for the input screen, measuring cycles in automatic, workpiece measurement

Bit1 Display Selection of softkey 3D measurement

Bit3 Enable Selection of probe calibration data field

Bit4 Select Calibrate input measuring feed 1)

Bit6 Enable Selection of WO compensation in basic frame (SETFRAME)

Bit7 Enable Selection of WO compensation in channel-specific basic frame

Bit8 Enable Selection of WO compensation in global basic frame

Bit9 Enable Selection of WO compensation in settable frame

Bit10 Enable Selection of WO compensation, coarse and fine

Bit11 Select Tool offset geometry and wear

Bit12 Select Tool offset, not inverted and inverted

Bit13 Select Tool offset L1, R or L1, L2, L3 R

Bit14 Select Tool offset work offset (_TZL)

Bit15 Select Tool offset dimensional difference check (_TDIF)

Bit16 Select Workpiece measurement with spindle reversal

Bit17 Select Align workpiece probe in switching direction

Bit18 Select Number of measurements (_NMSP)

Bit19 Select Offset with averaging (_TMV) 1)

Bit20 Select Empirical values (_EVNUM)

Bit21 Select Additive setup offset

Bit22 Select Calibrate to unknown or known center point

Bit24 Select Calibrate with/without positional deviation

Bit25 Enable Select Work offset when measuring the angularity of the spindle

Bit26 Select Do not enable tool offset

Bit27 Do not enable: Select tolerance of linear vectors with measurement of complete kinematics

Bit28 Enable Select adapt tool length

If WO compensation bit 6..10 is not selected, then list "Measure only"..

If WO compensation bit 6..10 is selected, then always also list compensation in active WO in the input screen

For averaging, display the following parameters: _K _TMV, _EVNUM

1) Input measuring feed applies to automatic and JOG

54762	MEA_FUNCTION_MASK_TOOL			-	-	
-	Setting for input screen, measuring cycles in Automatic, tool measuring			DWORD	Immediately	
-						
-	-	0	-	-	7/5	U

Description: Setting for input screen, Measuring cycles in Automatic, Tool measurement

54762 MEA_FUNCTION_MASK_TOOL

Bit3 Enable selection of tool probe calibration data field

Bit4 Select Calibrate input measuring feed (VMS) 1)

Bit5 Select Input feed and spindle speeds for contacting

Bit7 Select Measure in Machine and Work

Bit8 Select Measure absolute and incremental
 Bit9 Select Tool offset geometry and wear
 Bit10 Select measuring function "Check teeth individually"
 Bit11 Select Spindle reversal when calibrating on the plane
 Bit12 Select Number of measurements (_NMSP)
 Bit13 Select Empirical values (_EVNUM)
 Bit14 Select offset correction with selection of direction
 1) Measuring feed input applies to Automatic and JOG

54764	MEA_FUNCTION_MASK_TURN	-	-
-	Setting for input screen, Measuring cycles in Automatic, Workpiece turning	DWORD	Immediately
-			
-	-	0	-
			7/5 U

Description: 54764 MEA_FUNCTION_MASK_TURN
 Setting for input screen, Measuring cycles Turning in Automatic
 Bit0 Measure inside/outside diameter with reversal
 Bit1 Measure inside/outside diameter "travel under turning center"?

54780	J_MEA_FUNCTION_MASK_PIECE	-	-
-	Settings for input screen Workpiece measurement in JOG	DWORD	Immediately
-			
-	-	131584	-
			7/5 U

Description: Settings for input screen Workpiece measuring in JOG
 Bit2 Activate compensation for electronic workpiece probe
 Bit3 Select probe calibration data field, enable
 Bit5 Select WO as basis for measuring
 Bit6 Select WO compensation in basic frame, enable
 Bit7 Select WO compensation in channel basic frame, enable
 Bit8 Select WO compensation in global basic frame, enable
 Bit9 Select WO compensation in settable frame, enable
 Bit16 Select Workpiece measurement with spindle reversal
 Bit17 Select Align workpiece probe in switching direction
 Bit28 Select adapt tool length, enable

54782	J_MEA_FUNCTION_MASK_TOOL	-	-
-	Settings for input screen Tool measuring in JOG	DWORD	Immediately
-			
-	-	0	-
			7/5 U

Description: Settings for input screen Tool measuring in JOG
 Bit2 Enable automatic tool measurement
 Bit3 Enable selection of tool probe calibration data field
 Bit10 Select measuring function "Check teeth individually"
 Bit 11 Select spindle reversal when calibrating on the plane

55200	MAX_INP_FEED_PER_REV	-	-
mm/rev	Upper limit feedrate/rev	DOUBLE	Immediately
-			
-	-	1	0
			15 7/4 M

2.5 Machine and setting data cycles

Description: Feedrate input upper limit for mm/rev

55201	MAX_INP_FEED_PER_TIME	-	-
mm/min	Upper limit feedrate/min	DOUBLE	Immediately
-			
-	-	10000	-
-	-	-	7/4
-	-	-	M

Description: Feedrate input upper limit for mm/min

55202	MAX_INP_FEED_PER_TOOTH	-	-
mm	Upper limit feedrate/tooth	DOUBLE	Immediately
-			
-	-	1	0
-	-	5	7/4
-	-	-	M

Description: Feedrate input upper limit for mm/tooth

55212	FUNCTION_MASK_TECH_SET	-	-
-	Function mask Cross-technology	BYTE	Immediately
-			
-	-	6	-
-	-	-	7/4
-	-	-	M

Description: Function mask for all technologies
 Bit 0: Tool preselection active
 Bit 1: Calculate thread depth from thread pitch
 Bit 2: Refer to Table for thread diameter and depth
 Bit 3: Delete programs generated from contour cycles (CYCLE63, CYCLE64, CYCLE952)
 0: Generated programs are not deleted (compatibility as before)
 1: Generated programs are deleted immediately after execution from the calling cycle

55214	FUNCTION_MASK_MILL_SET	-	-
-	Function mask for milling	DWORD	Immediately
-			
-	-	5	-
-	-	-	7/4
-	-	-	M

Description: Function mask for milling
 Bit 0: Default setting - milling cycles with synchronous operation
 Bit 2: Depth calculation in milling cycles without parameter SC

55216	FUNCTION_MASK_DRILL_SET	-	-
-	Function mask for drilling	DWORD	Immediately
-			
-	-	24	-
-	-	-	7/4
-	-	-	M

Description: Function mask for drilling
 Bit 0: Tapping CYCLE84: Reverse direction of spindle rotation during cycle
 Bit 1: Boring CYCLE86: Take into consideration rotation of the tool plane when positioning the spindle
 Bit 2: Boring CYCLE86: When positioning the spindle, take into account swiveled table kinematics (toolholder)
 Bit 3: Tapping CYCLE84: Monitoring machine data 31050 and 31060 of the spindle
 Bit 4: Tapping CYCLE84: Monitoring machine data 31050 and 31060 of the spindle
 Bit 6: Boring CYCLE86: Adapt spindle position to the orientation of the tool
 Tool orientation can be realized using TOOLCARR or TRAORI before the cycle is called.

If bit6=1, bits 1 and 2 are no longer effective.

Bit 7: Boring CYCLE86: Adapt the direction of the retraction path in the plane to active mirroring

0: Retraction in the plane is realized as programmed

1: When mirroring is active, when retracting in the plane, the direction is adapted in the cycle to the active mirroring.

55218	FUNCTION_MASK_TURN_SET	-	-
-	Function mask Turning	DWORD	Immediately
-			
-	-	1	-

Description:

Function mask for turning

Bit 0: New thread table for thread cutting

Bit 1: Reserved (CYCLE93)

Bit 2: Reserved (CYCLE93)

Bit 3: Chamfer in CYCLE930 as chamfer length (CHF)

Bit 4: Retraction from inside machining (CYCLE951)

0: Compatibility as before

If the necessity for rounding the corner is detected in the cycle, the tool is retracted from the inside machining, otherwise it is not.

1: It is generally retracted from the inside machining in the cutting axis.

Bit 5: Disable new smoothing behavior in thread cutting cycles

0: The new smoothing behavior is active in the threading cycles between thread blocks (G33, G34, G35 ...).

This improves the dynamic response adaptation in thread blocks that serve for run-in, run-out or as a transition element of the thread

by using a larger proportion of the block length for the dynamic response adaptation.

The prerequisite for this function is the setting data setting SD 42010 \$SC_THREAD_RAMP_DISP[2]=-1.

1: The new smoothing behavior is not active between thread blocks (compatibility).

55220	FUNCTION_MASK_MILL_TOL_SET	-	-
-	Function mask for high-speed settings CYCLE832	DWORD	Immediately
-			
-	-	0	-

Description:

Function mask for high-speed settings CYCLE832

Bit 0: Display input fields technology

=0: Hide input fields technology

=1: Display input fields technology

Bit 1: Enter orientation tolerance (OTOL) as factor of tolerance (CTOL) or enter directly

Bit 1 is only relevant for machines in which orientation transformation has been setup

=0: Orientation tolerance (OTOL) is calculated as factor of the entered tolerance

=1: Enter orientation tolerance (OTOL) directly into the input screen

The factor to calculate the orientation tolerance is saved in the following setting data

\$SCS_MILL_TOL_FACTOR_ROUGH for the machining type, roughing G group 59 DYNROUGH

\$SCS_MILL_TOL_FACTOR_SEMIFIN for the machining type, semi-finishing G group 59 DYNSEMIFIN

2.5 Machine and setting data cycles

\$SCS_MILL_TOL_FACTOR_FINISH for the machining type, finishing G group 59 DYNFINISH
 \$SCS_MILL_TOL_FACTOR_FINEFIN for the machining type, finishing G group 59 DYNPREC
 Bit 2: A mold-making function can be selected in the High Speed Settings mask
 =0: The best available mold-making function is used automatically

- Top Surface option not active -> Advanced Surface
- Top Surface option active -> Top Surface

=1: The mold-making function (Advanced Surface or Top Surface) can be selected in the mask (only if the Top Surface option is active)
 Bit 3: High Speed Settings mask without Advanced Surface option
 =0: The High Speed Settings mask is only offered with the Advanced Surface option
 =1: The High Speed Settings mask is also offered without the Advanced Surface option
 Bit 4: Display smoothing selection
 =0: Do not display smoothing selection (corresponds to smoothing = yes)
 =1: Display smoothing selection

55221	FUNCTION_MASK_SWIVEL_SET			-	-	
-	Function mask for swivel CYCLE800			DWORD	Immediately	
-						
-	-	256	-	-	7/3	M

Description:

Function mask for swivel CYCLE800
 The settings of the function mask (bits 0 to 4) for swivel act on all swivel data records
 Bit 0: Show "No swivel" input field
 =0: Hide "No swivel" input field
 =1: Show "No swivel" input field
 Bit 1: Retract "fixed point 1/2" instead of "Z", "Z XY"
 =0: Selection text retract "Z" or retract "Z XY"
 =1: Selection text retract "fixed point 1" or retract "fixed point 2"
 Bit 2: Permit selection of "deselection" of the swivel data record
 =0: Do not permit selection of "deselection" of the swivel data record (hide)
 =1: Permit selection of "deselection" of the swivel data record
 Bit 3: Show active swivel plane under swivel in JOG
 =0: Hide active swivel plane under swivel in JOG
 =1: Show active swivel plane under swivel in JOG
 Bit 4: Evaluate input values for swiveling in the pole position of the machine kinematics
 =0: Evaluation of the input values with swiveling in pole position
 =1: No evaluation of the input values with swiveling in pole position (compatibility)
 Starting from the initial position of the machine kinematics, the input values when swiveling are evaluated so that continuous swiveling around the pole axis is possible
 Pole axis is the rotary axis of the swivel data record that rotates around the tool axis
 Example: rotary axis C rotates around Z for G17./
 Additional settings of the pole axis:
 Angular range (traversing range) of >360 degrees in the swivel data record
 Bit 5 Align tool (turning technology) using frame calculation (TCOFRY) or absolute (TCOABS)
 The tool orientation of the orientable tool carrier is calculated
 either using a frame calculation (TCOFRY for G18) or in absolute terms with TCOABS

For B axis kinematics of a turning machine, the tool spindle in the initial setting of the kinematics

can be set up parallel to either Z or to X. See also "Swivel data" under Commissioning.

For new systems being commissioned, it is recommended you set bit 5=1:

=0: Align tool using frame calculation (TCOFRY for G18, compatibility)

=1: Align tool absolutely (TCOABS)

Bit 6: Do not offer "direct" swivel mode under swivel in JOG

=0: "Direct" swivel mode is offered under swivel in JOG

=1: "Direct" swivel mode is not offered under swivel in JOG

Bit 7: Swivel plane: Direction selection in initial setting of the kinematics

Behavior with swivel plane in initial setting of the kinematics if the NCK calculates two solutions:

=0 With selected direction + or -, both calculated solutions of the rotary axes are approached. (Compatibility)

=1 With selected direction + or -, only one of the calculated solutions of the rotary axes is approached.

Compatibility for PowerLine up to SW 7.x and for SolutionLine up to SW 1.x

Bit 8: Work offset of the rotary axes of the swivel data record traversed as an offset

=0 Work offset of the rotary axes of the swivel data record is only taken into account in the WCS (compatibility)

=1 Work offset of the rotary axes of the swivel data record traversed as an offset

Setting is in conjunction with MD21186 \$MC_TOCARR_ROT_OFFSET_FROM_FR

Bit 9: Swivel data set TC permanently assigned to the tool

=0 Display number of the swivel data record TC

=1 Do not display number of the swivel data record TC

Assignment of the swivel data record to the tool is performed in SGUD_TC_GNO

if technology cylindrical grinding is set in MD52200 \$MCS_TECHNOLOGY =3

Example:

_TC_GNO can be written by the machine manufacturer in the tool change program I6

Bit 10: Swivel plane: Show input field "positioning direction"

=0: The input field "positioning direction" is hidden.

=1: The input field "positioning direction" is displayed with swivel tables and swivel head / table combinations.

Bit 11: Positioning of both solutions of an AB kinematics

=0 Compatibility. Positioning of only one solution with specific swivel angles

=1 Positioning of both solutions calculated by the NCK

Bit11 should be set =1 with kinematics, on which - in the basic position - none of the two rotary axes rotates around

the tool axes (AB kinematics with tool axes in Z direction)

Bit 12: Swivel plane, tool alignment: reset behavior taking the rotary axis positions into account

=0 Compatibility. Reset state refers to the end positions of the rotary axes in the swivel data record

=1 Reset state refers to the current positions of the rotary axes in the swivel data record

If bit12=0, a linear axis identifier is written in the parameters \$TC_CARR21/22.

The tool carrier is thus initialized with the end positions of the rotary axes (\$TC_CARR13/14) on reset (TCOABS).

If Bit12=1, the names of the rotary axes of the swivel data record are written in the parameters \$TC_CARR21/22.

The tool carrier is thus initialized with the actual values of the rotary axes on reset (TCOABS).

2.5 Machine and setting data cycles

Bit 13: Activation of the extended evaluation of the rotations with axis-by-axis swiveling in the pole position.

=0 No evaluation of the rotations with swiveling in the pole position (compatibility)
The settings of bits 4, 7 and 11 apply

=1 Extended evaluation of the rotations with swiveling in the pole position

With kinematics with 2 rotary axes, one of the rotary axes can be the pole axis. A rotary axis is then in the pole position, if it rotates around the tool axis. In contrast to bit4, the input values are still evaluated if bit13 is set if the 1st rotary axis is not in the initial position.

Example: Table kinematics with 1st rotary axis A (rotates around X) and 2nd rotary axis B (rotates around Y) G17

After axis-by-axis swiveling around Y and then around X=90°, the 2nd rotary axis is in pole position.

Setting for swivel data record: Rotary axis reference must be set to the rotary axis that is not the pole axis (in the example: rotary axis 1).

When the bit is set, the input rotations are evaluated so that continuous swiveling around the pole axis/tool axis is possible. The following applies: the "+" solution of CYCLE800 has no additional rotation, whereas the "-" solution has an additional 180° rotation in the Actframe in the tool axis.

If bit13 is set, the settings of bits 4, 7 and 11 have no effect.

55230	CIRCLE_RAPID_FEED	-	-
mm/min	Positional feed on circular paths	DOUBLE	Immediately
-			
-	-	10000	100
		100000	7/4
			M

Description: Rapid traverse feedrate in mm/min for positioning on circle path

55232	SUB_SPINDLE_REL_POS	-	-
mm	Retract position Z for counterspindle	DOUBLE	Immediately
-			
-	-	0	-
		-	7/4
			M

Description: Z retraction position for the counterspindle

55260	MAJOG_SAFETY_CLEARANCE	-	-
mm	Safety clearance for machine JOG	DOUBLE	Immediately
-			
-	-	1	0.1
		100	7/4
			M

Description: Safety clearance for machine JOG

55261	MAJOG_RELEASE_PLANE	-	-
mm	Retraction plane for machine JOG	DOUBLE	Immediately
-			
-	-	100	-
		-	7/4
			M

Description: Retraction plane for machine JOG

55300	EASY_SAFETY_CLEARANCE	-	-
mm	Simple input: Safety clearance	DOUBLE	Immediately
-			
-	-	1	-
		-	7/4
			M

Description: Simple input: safety clearance

The input field for the safety clearance is not available in the simple input screens.

Instead, the value of this setting data is always used.

55301	EASY_DWELL_TIME	-	-
s	Simple input: dwell time	DOUBLE	Immediately
-			
-	-	0.6	-100
		100	7/4
			M

Description: Simple input: dwell time in seconds
The input fields for dwell times are not available in the simple input screens.
Instead, the value of this setting data is always used.

55305	EASY_DRILL_DEEP_FD1	-	-
%	Simple input: percentage 1st feedrate deep-hole drilling	DOUBLE	Immediately
-			
-	-	90	0
		100	7/7
			U

Description: Simple input: percentage 1st feedrate deep-hole drilling
The input field for this percentage is not available in the simple input screens.
Instead, the value of this setting data is always used.

55306	EASY_DRILL_DEEP_DF	-	-
%	Simple input: percentage infeed deep-hole drilling	DOUBLE	Immediately
-			
-	-	90	0
		100	7/7
			U

Description: Simple input: percentage infeed deep-hole drilling
The input field for this percentage is not available in the simple input screens.
Instead, the value of this setting data is always used.

55307	EASY_DRILL_DEEP_V1	-	-
mm	Simple input: min. depth infeed deep-hole drilling	DOUBLE	Immediately
-			
-	-	1.2	-
		-	7/4
			M

Description: Simple input: min. depth infeed deep-hole drilling
The input field for the minimum depth infeed is not available in the simple input screens.
Instead, the value of this setting data is always used.

55308	EASY_DRILL_DEEP_V2	-	-
mm	Simple input: absolute retraction value deep-hole drilling	DOUBLE	Immediately
-			
-	-	1.4	-
		-	7/4
			M

Description: Simple input: absolute retraction value deep-hole drilling
The input field for the absolute retraction value is not available in the simple input screens.
Instead, the value of this setting data is always used

55309	EASY_THREAD_RETURN_DIST	-	-
mm	Simple input: return distance thread tapping	DOUBLE	Immediately
-			
-	-	2	-
		-	7/4
			M

Description: Simple input: return distance thread tapping

2.5 Machine and setting data cycles

The input field for the return distance is not available in the simple input screens.
Instead, the value of this setting data is always used.

55400	MILL_ENGRAVE_POINT_RAD	-	-
mm	Engraving cycle CYCLE60: Circ. path radius for generating the char. "point"	DOUBLE	Immediately
-			
-	-	0	0
		10	7/7
			U

Description: Input value equals zero: The character "point" is realised by a simple linear insertion movement of the tool
(Default setting for conventional engraving tools, compatibility).
Input value greater than zero: The character "point" is executed as a circle with the radius value from this setting data
(Setting for certain special tools).

55410	MILL_SWIVEL_ALARM_MASK	-	-
-	Hide and unhide cycle alarms	DWORD	Immediately
-			
-	-	0	-
		-	7/5
			M

Description: Display of cycle alarms CYCLE800, CYCLE996, CYCLE9960
Bit 0: Display alarm 62186: Active work offset G54 ff. and base (basic reference) contain rotations
Bit 1: Display alarm 62187: Active base and basic reference (G500) contain rotations
Bit 2: Display alarm 61148: Swivel plane not possible with active turning tool
Bit 3: Display alarm 61426: Kinematics measurement with CYCLE9960/996. Hide 1 = Alarm 61426

55420	MILL_SWIVEL_RESET_RETRACT	-	-
-	Initial setting swivel: retract	BYTE	Immediately
-			
-	-	0	0
		5	7/5
			M

Description: Initial setting swivel: retract
With this setting data, the status adopted by the toggler "Retract" in the mask "Swivel plane" when activating the "Initial setting" softkey can be set:
0 = no change
1 = no
2 = Z
3 = Z XY
4 = Tool direction max.
5 = Tool direction inc.

55421	MILL_SWIVEL_RESET_TRACK	-	-
-	Initial setting swivel: tool correction	BYTE	Immediately
-			
-	-	0	0
		2	7/5
			M

Description: Initial setting swivel: Tool correction
With this setting data, the status adopted by the toggler "Tool correction" in the mask "Swivel plane" after activating the softkey "Initial setting" can be set:
0 = no change
1 = do not correct

2 = correct

55422	MILL_SWIVEL_RESET_MODE	-	-
-	Initial setting swivel: swivel mode	BYTE	Immediately
-			
-	-	0	0
-	-	1	7/5
-	-	0	M

Description: Initial setting for swivel: Swivel mode
 With this setting data, the state of the "Swivel mode" toggler in the "Swivel plane" mask can be set with the "Initial setting" softkey:
 0 = axis by axis
 1 = direct

55423	MILL_SWIVEL_RESET_SEQ_AXIS	-	-
-	Initial setting swiveling: axis sequence	BYTE	Immediately
-			
-	-	0	0
-	-	5	7/5
-	-	0	M

Description: Initial setting swiveling: Axis sequence
 The status adopted by the "Axis sequence" toggler in the "Swivel plane" mask after activating the "Initial setting" softkey can be set with this setting data:
 0 = X Y Z
 1 = X Z Y
 2 = Y X Z
 3 = Y Z X
 4 = Z X Y
 5 = Z Y X

55441	MILL_TOL_FACTOR_ROUGH	-	-
-	Rotary axes tolerance factor for roughing CYCLE832 of G group 59	DOUBLE	Immediately
-			
-	-	10	0
-	-	1000	7/5
-	-	0	U

Description: Rotary axes tolerance factor for roughing CYCLE832 of G group 59

55442	MILL_TOL_FACTOR_SEMIFIN	-	-
-	Rotary axes tolerance factor for prefinishing CYCLE832 of G group 59	DOUBLE	Immediately
-			
-	-	10	0
-	-	1000	7/5
-	-	0	U

Description: Rotary axes tolerance factor for prefinishing CYCLE832 of G group 59

55443	MILL_TOL_FACTOR_FINISH	-	-
-	Rotary axes tolerance factor for finishing CYCLE832 of G group 59	DOUBLE	Immediately
-			
-	-	10	0
-	-	1000	7/5
-	-	0	U

Description: Rotary axes tolerance factor for finishing CYCLE832 of G group 59

55444	MILL_TOL_FACTOR_PRECISION	-	-
-	Rotary axes tolerance factor for smooth-finishing CYCLE832 of G group 59	DOUBLE	Immediately
-			
-	-	10	0
-	-	1000	7/5
-	-	0	U

2.5 Machine and setting data cycles

Description: Rotary axes tolerance factor for smooth-finishing CYCLE832 of G group 59

55446	MILL_TOL_VALUE_ROUGH	-	-
mm	Tolerance value for roughing CYCLE832 (High Speed Settings)	DOUBLE	Immediately
-			
-	-	0.1	0
		10	7/5
			U

Description: Tolerance value for roughing CYCLE832

55447	MILL_TOL_VALUE_SEMIFIN	-	-
mm	Tolerance value for roughing CYCLE832 (High Speed Settings)	DOUBLE	Immediately
-			
-	-	0.05	0
		10	7/5
			U

Description: Tolerance value for prefinishing CYCLE832

55448	MILL_TOL_VALUE_FINISH	-	-
mm	Tolerance value for finishing CYCLE832 (High Speed Settings)	DOUBLE	Immediately
-			
-	-	0.01	0
		10	7/5
			U

Description: Tolerance value for finishing CYCLE832

55449	MILL_TOL_VALUE_PRECISION	-	-
mm	Tolerance value for smooth-finishing CYCLE832 (High Speed Settings)	DOUBLE	Immediately
-			
-	-	0.005	0
		10	7/5
			U

Description: Tolerance value for smooth-finishing CYCLE832

55451	MILL_ORI_TOL_ROUGH	-	-
degrees	Orientation tolerance for roughing CYCLE832 (High Speed Settings)	DOUBLE	Immediately
-			
-	-	1	0
		10	7/5
			U

Description: Tolerance value of tool orientation for roughing CYCLE832

55452	MILL_ORI_TOL_SEMIFIN	-	-
degrees	Orientation tolerance for semi-finishing CYCLE832 (High Speed Settings)	DOUBLE	Immediately
-			
-	-	0.5	0
		10	7/5
			U

Description: Tolerance value of tool orientation for semi-finishing CYCLE832

55453	MILL_ORI_TOL_FINISH	-	-
degrees	Orientation tolerance for finishing CYCLE832 (High Speed Settings)	DOUBLE	Immediately
-			
-	-	0.3	0
		10	7/5
			U

Description: Tolerance value of tool orientation for finishing CYCLE832

55454	MILL_ORI_TOL_PRECISION	-	-
degrees	Orientation tolerance for smooth-finishing CYCLE832 (High Speed Settings)	DOUBLE	Immediately
-			
-	-	0.1	0
		10	7/5
			U

Description: Tolerance value of tool orientation for smooth-finishing CYCLE832

55460	MILL_CONT_INITIAL_RAD_FIN	-	-
mm	Contour pocket milling: approach circle radius finishing	DOUBLE	Immediately
-			
-	-	0	0
		100	7/4
			M

Description: This data affects the radius of the approach circle during contour pocket finishing.
 0: the radius is selected to maintain a safety clearance to the finishing allowance in the starting point.
 >0: the radius is selected to maintain the value of this setting data to the finishing allowance in the starting point.

55481	DRILL_TAPPING_SET_GG12	-	-
-	Setting tapping G group 12: block change behavior at exact stop	DOUBLE	Immediately
-			
-	2	0	0
		3	7/4
			M

Description: Settings for tapping G group 12 cycle CYCLE84 and CYCLE840:
 G group 12: block change behavior at exact stop (G60)

55482	DRILL_TAPPING_SET_GG21	-	-
-	Setting tapping G group 21: acceleration profile	DOUBLE	Immediately
-			
-	2	0	0
		3	7/4
			M

Description: Settings for tapping G group 21 cycle CYCLE84
 G group 21: acceleration profile (SOFT, BRISK, ...)

55483	DRILL_TAPPING_SET_GG24	-	-
-	Setting tapping G group 24: precontrol	DOUBLE	Immediately
-			
-	2	0	0
		2	7/4
			M

Description: Settings for tapping G group 24 cycle CYCLE84 and CYCLE840:
 G group 24: precontrol (FFWON, FFWOF)

55484	DRILL_TAPPING_SET_MC	-	-
-	Setting tapping: spindle operation at MCALL	DOUBLE	Immediately
-			
-	2	0	0
		1	7/4
			M

Description: Setting for tapping cycle CYCLE84 spindle operation at MCALL
 0= reactivate spindle operation at MCALL
 1= maintain position-controlled spindle operation at MCALL

2.5 Machine and setting data cycles

55489	DRILL_MID_MAX_ECCENT	-	-
mm	Max. center offset f. center boring	DOUBLE	Immediately
-			
-	-	0.5	0
		10	7/4
			M

Description: Maximum center offset for center boring

55490	DRILL_SPOT_DIST	-	-
mm	Preboring depth drill and thread milling	DOUBLE	Immediately
-			
-	-	1	0
		100	7/4
			M

Description: Preboring depth for drill and thread milling

55500	TURN_FIN_FEED_PERCENT	-	-
%	Roughing feedrate for complete machining in %	BYTE	Immediately
-			
-	-	100	1
		100	7/4
			M

Description: When selecting Complete machining (roughing and finishing), the percentage of the entered feedrate F as specified in this setting data is used for finishing.

55505	TURN_ROUGH_O_RELEASE_DIST	-	-
mm	Return distance stock removal for external machining	DOUBLE	Immediately
-			
-	-	1	-1
		100	7/4
			M

Description: Using this setting data, you enter the clearance, by which the tool is retracted from the contour when removing stock from an outer corner. This is not applicable for removing stock from a contour

1: The safety clearance is used as clearance.

55506	TURN_ROUGH_I_RELEASE_DIST	-	-
mm	Return distance stock removal for internal machining	DOUBLE	Immediately
-			
-	-	0.5	-1
		100	7/4
			M

Description: Using this setting data, you enter the clearance, by which the tool is retracted from the contour when removing stock from an inner corner. This is not applicable for removing stock from a contour.

-1: The safety clearance is used as clearance.

55510	TURN_GROOVE_DWELL_TIME	-	-
s	Tool clearance time for grooving at the base (neg. value=rotations)	DOUBLE	Immediately
-			
-	-	-1	-100
		100	7/4
			M

Description: If a tool clearance time occurs in a cycle, e.g. deep hole drilling, grooving, the value of this setting data is used

- negative value in spindle revolutions
- positive value in seconds

55540	TURN_PART_OFF_CTRL_DIST	-	-
mm	Path for cut-off check	DOUBLE	Immediately
-			
-	-	0.1	0
		10	7/4
			M

Description: Path for cut-off check

55541	TURN_PART_OFF_CTRL_FEED	-	-
mm/min	Feedrate for cut-off check	DOUBLE	Immediately
-			
-	-	0	-
		-	7/4
			M

Description: Feedrate for cut-off check

55542	TURN_PART_OFF_CTRL_FORCE	-	-
%	Force for cut-off check in %	DOUBLE	Immediately
-			
-	-	10	1
		100	7/4
			M

Description: Force in percent for cut-off check

55543	TURN_PART_OFF_RETRACTION	-	-
mm	Retraction path prior to cut-off with counterspindle	DOUBLE	Immediately
-			
-	-	0	0
		1	7/4
			M

Description: Retraction path prior to cut-off with counterspindle

55550	TURN_FIXED_STOP_DIST	-	-
mm	Counterspindle: path for travel to fixed stop	DOUBLE	Immediately
-			
-	-	10	0.001
		1000	7/4
			M

Description: In this setting data you specify the distance to the programmed target position, after which the counterspindle travels with a special feedrate during travel to fixed stop (see 55551 \$SCS_TURN_FIXED_STOP_FEED).

55551	TURN_FIXED_STOP_FEED	-	-
mm/min	Counterspindle: feedrate for travel to fixed stop	DOUBLE	Immediately
-			
-	-	0	-
		-	7/4
			M

Description: In this setting data you specify the feedrate with which the counterspindle travels to a fixed stop. In setting data 55550 \$SCS_TURN_FIXED_STOP_DIST you specify the distance after which the tool travels in this feedrate.

55552	TURN_FIXED_STOP_FORCE	-	-
%	Counterspindle: force for travel to fixed stop in %	DOUBLE	Immediately
-			
-	-	10	1
		100	7/4
			M

Description: In this setting data you specify at which percentage of the driving force the counterspindle is to stop during travel to fixed stop.

2.5 Machine and setting data cycles

55553	TURN_FIXED_STOP_RETRACTION	-	-
mm	Counterspindle: retraction path prior to chucking after fixed stop	DOUBLE	Immediately
-			
-	-	0	0
-	-	1	7/4
-	-	M	

Description: Retraction path prior to chucking after travel to fixed stop

55580	TURN_CONT_RELEASE_ANGLE	-	-
degrees	Contour turning: retraction angle	DOUBLE	Immediately
-			
-	-	45	0
-	-	90	7/4
-	-	M	

Description: This setting data defines the angle by which the tool is retracted from the contour during contour turning roughing.

55581	TURN_CONT_RELEASE_DIST	-	-
mm	Contour turning: retraction value	DOUBLE	Immediately
-			
-	-	1	0.01
-	-	10	7/4
-	-	M	

Description: This setting data defines the value by which the tool is retracted in both axes during contour turning roughing.

55582	TURN_CONT_TRACE_ANGLE	-	-
degrees	Contour turning: minimum angle for rounding along contour	DOUBLE	Immediately
-			
-	-	5	0
-	-	90	7/4
-	-	M	

Description: This setting data specifies the angle between the cutting edge and the contour, at which the contour is rounded in order to remove residual material.

55583	TURN_CONT_VARIABLE_DEPTH	-	-
%	Contour turning: percentage for variable cutting depth	BYTE	Immediately
-			
-	-	20	0
-	-	50	7/4
-	-	M	

Description: Percentage for variable cutting depth during contour turning

55584	TURN_CONT_BLANK_OFFSET	-	-
mm	Contour turning: blank allowance	DOUBLE	Immediately
-			
-	-	1	0
-	-	100	7/4
-	-	M	

Description: This setting data specifies the distance to the blank, after which contour turning is switched from G0 to G1 in order to adjust any possible blank allowances.

55585	TURN_CONT_INTERRUPT_TIME	-	-
s	Contour turning: feed interrupt time (neg. values = revolutions)	DOUBLE	Immediately
-			
-	-	-1	-
-	-	-	7/4
-	-	M	

Description: Feed interrupt time during contour turning, contour grooving and plunge turning

- negative value in spindle revolutions
- positive value in seconds

This setting data is effective only if setting data 55586 is \$SCS_TURN_CONT_INTER_RETRACTION = 0.

55586	TURN_CONT_INTER_RETRACTION	-	-
mm	Contour turning: retraction path after feed interrupt	DOUBLE	Immediately
-			
-	-	1	0
		10	7/4
			M

Description: Retraction path feed interrupt during contour turning, contour grooving and plunge turning:

>0: retraction path after feed interrupt (setting data 55585
\$SCS_TURN_CONT_INTERRUPT_TIME is ineffective!)
=0: no retraction path

55587	TURN_CONT_MIN_REST_MAT_AX1	-	-
%	Contour turning: minimum difference dimension residual machining axis 1	DOUBLE	Immediately
-			
-	-	50	0
		1000	7/4
			M

Description: This MD defines the limit value for stock removal of residual material in the direction of the 1st axis.

Example:

If this MD is set to 50% and if the finishing allowance is 0.5mm, the residual material which is thinner than 0.25mm is not removed in a separate machining step, but during finishing.

55588	TURN_CONT_MIN_REST_MAT_AX2	-	-
%	Contour turning: minimum difference dimension residual machining axis 2	DOUBLE	Immediately
-			
-	-	50	0
		1000	7/4
			M

Description: This MD defines the limit value for stock removal of residual material in the direction of the 2nd axis.

Example:

If this MD is set to 50% and if the finishing allowance is 0.5mm, the residual material which is thinner than 0.25mm is not removed in a separate machining step, but during finishing.

55595	TURN_CONT_TOOL_BEND_RETR	-	-
mm	Contour plunge turning: retraction path due to tool bending	DOUBLE	Immediately
-			
-	-	0.1	0
		1	7/4
			M

Description: Retraction due to tool bending during plunge turning

55596	TURN_CONT_TURN_RETRACTION	-	-
mm	Contour plunge turning: retraction depth prior to turning	DOUBLE	Immediately
-			
-	-	0.1	0
		1	7/4
			M

Description: Retraction depth prior to plunge turning

55613	MEA_RESULT_DISPLAY	-	-
-	Selection of measurement result display	BYTE	Immediately
-			
-	-	0	0
		10	7/7
			U

2.5 Machine and setting data cycles

Description: Measurement results screen display

=0: No measurement results screen

=1: The measurement results screen is visible for a fixed time of 8 seconds

=3: When the measurement results screen is visible, the cycle is stopped by an internal M0;

on NC start the measuring cycle is resumed and the measurement results screen is deselected.

=4: The measurement results screen only appears in the case of cycle alarms 61303, 61304, 61305, 61306.

55614	MEA_RESULT_MRD	-	-
-	Program control of the display of the measurement result image MRD	BYTE	Immediately
-			
-	-	1	0

Description: Setting of the program control of the display of the measurement result image MRD

0= Hide measurement result image

1= Show measurement result image

55618	MEA_SIM_ENABLE	-	-
-	Setting measuring cycles under a simulated environment	BYTE	Immediately
-			
-	-	1	0

Description: Setting measuring cycles under a simulated environment

=0: The measuring cycles are terminated without function.

=1: The measuring cycles are executed.

- Simulation in HMI Operate:
 - The traversing motion is visualized.
 - No measurement results and measurement result display are available.
- SinuTrain:
 - Measurement results and measurement result display are available.
 - The traversing motion is visualized using simultaneous recording.
- For systems, that only operate with simulated axes (e.g. virtual machine, test rack):
 - Measurement results and measurement results display are available.
 - The traversing motion is visualized with simultaneous recording.
 - In this case, the following settings must be observed:
 - MD10360 \$MN_FASTIO_DIG_NUM_OUTPUTS >=1
 - MD13230 \$MN_MEAS_PROBE_SOURCE = 1 to 4
 - = 2 to 8: reserved
 - = 9 internal

55619	MEA_SIM_MEASURE_DIFF	-	-
mm	Value for simulated error of measurement	DOUBLE	Immediately
-			
-	-	0	-100

Description: With this parameter simulated measurement errors can be specified on the measuring points.

Provided that SD55618 \$SCS_MEA_SIM_ENABLE=1 is used and that the measuring cycles are executed in a

simulated environment of HMI, a measurement difference can be entered in this parameter. The value of the measurement difference must be smaller than the measuring path in parameter _FA!

Otherwise cycle alarm 61301 "Probe does not switch" is output during active simulation.

55622	MEA_EMPIRIC_VALUE_NUM	-	-
-	Number of empirical values	DWORD	Immediately
-			
-	-	20	0
-		20	7/5
-			U

Description: Number of empirical values

55623	MEA_EMPIRIC_VALUE	-	-
mm	Empirical value memory	DOUBLE	Immediately
-			
-	20	0	-100000
-		100000	7/7
-			U

Description: In its default setting the empirical value memory consists of 20 memory elements. Using parameter \$SCS_MEA_EMPIRIC_VALUE_NUM the number of memory elements can be defined! Currently, however, these 20 memory elements cannot be changed! In the empirical value memory, empirical values can be stored which are cleared with the currently calculated difference between the setpoint and the actual value. Using parameter _EVNUM the empirical value element to be cleared is addressed!

55624	MEA_AVERAGE_VALUE_NUM	-	-
-	Number of mean values	DWORD	Immediately
-			
-	-	20	0
-		20	7/5
-			U

Description: Number of mean values

55625	MEA_AVERAGE_VALUE	-	-
-	Mean value memory	DOUBLE	Immediately
-			
-	20	0	-100000
-		100000	7/7
-			U

Description: In its default setting the mean value memory consists of 20 memory elements. Using parameter \$SCS_MEA_AVERAGE_VALUE_NUM the number of memory elements can be defined! Currently, however, these 20 memory elements cannot be changed! In the mean value memory, the mean values calculated in connection with functionality "Automatic tool offset with mean value creation" are stored. Using parameter _EVNUM the mean value element to be used is addressed!

55628	MEA_TP_FEED_MEASURE	-	-
mm/min	Feed for calibrating a tool probe	DOUBLE	Immediately
-			
-	-	300	0
-		100000	7/7
-			U

Description: MEA_TP_FEED_MEASURE
Feed for calibrating a tool probe with stationary spindle in AUTO and JOG

2.5 Machine and setting data cycles

55630	MEA_FEED_MEASURE			-	-	
mm/min	Feed for calibrating a workpiece probe			DOUBLE	Immediately	
-						
-	-	300	0	100000	7/7	U

Description: MEA_FEED_MEASURE
Feed for calibrating a workpiece probe in Automatic and JOG

55631	MEA_FEED_MEASURE_DEG			-	-	
rev/min	Measurement feedrate of workpiece probe during positioning of a rotary axis			DOUBLE	Immediately	
-						
-	-	1	0	100000	7/7	U

Description: Measurement feedrate of workpiece probe during positioning of a rotary axis

55632	MEA_FEED_RAPID_IN_PERCENT			-	-	
%	Rapid traverse velocity in per cent, for intermediate positioning			DOUBLE	Immediately	
-						
-	-	50	0	100	7/7	U

Description: Traverse velocities for positioning in the measuring cycle between the measuring positions,
with rapid traverse velocity in per cent, with collision detection not active

Note:

If necessary, adapt the value of the rapid traverse velocity in per cent to the probe type used and to the machine characteristics! This means that the maximum deflection of the actual probe type must be considered!!

Explanations:

In the measuring cycles any intermediate positions are calculated prior to the actual set of measurements. These positions can be approached

- with collision detection (SD55740 \$SCS_MEA_FUNCTION_MASK Bit0/Bit16=1 or
- without collision detection (SD55740 \$SCS_MEA_FUNCTION_MASK Bit0/Bit16=0).

Depending on this setting different velocities are used for the approach:

- with collision detection (SD55740 \$SCS_MEA_FUNCTION_MASK Bit0/Bit16=1):
With SD55634 \$SCS_MEA_FEED_PLAN_VALUE the traversing feed is performed in the plane and
with SD55636 \$SCS_MEA_FEED_FEEDAX_VALUE during traversing in the feed axis (applicate).
If the probe switches when these intermediate positions are approached, the movement is stopped and the alarm "Probe collision" is output.
- without collision detection (SD55740 \$SCS_MEA_FUNCTION_MASK Bit0/Bit16=0):
The intermediate positions are approached with the maximum axis velocity (rapid traverse) in per cent as specified in SD55632 \$SCS_MEA_FEED_RAPID_IN_PERCENT.
With SD55632 \$SCS_MEA_FEED_RAPID_IN_PERCENT=0 and SD55632 \$SCS_MEA_FEED_RAPID_IN_PERCENT=100 the maximum axis velocity is effective.

55634	MEA_FEED_PLANE_VALUE			-	-	
mm/min	Traverse velocity for intermediate positioning in the plane			DOUBLE	Immediately	
-						
-	-	1000	0	100000	7/7	U

Description: MEA_FEED_MEASURE
Traversing velocity for the intermediate positioning in the plane in Automatic and JOG

55636	MEA_FEED_FEEDAX_VALUE	-	-
mm/min	Positioning velocity in the infeed axis	DOUBLE	Immediately
-			
-	-	1000	0
		100000	7/7
			U

Description:

Traversing speed for intermediate positioning in the measuring cycle in the infeed axis, with or without collision detection

Note:

If necessary, adapt the value of the speed in the infeed axis to the probe type used and to the

machine characteristics! This means that the maximum deflection of the actual probe type must be considered!!

Explanations:

In the measuring cycles any intermediate positions are calculated prior to the actual set of measurements. These positions can be approached

- with collision detection (SD55740 \$SCS_MEA_FUNCTION_MASK Bit0/Bit16=1) or
- without collision detection (SD55740 \$SCS_MEA_FUNCTION_MASK Bit0/Bit16=0).

Depending on this setting different speeds are used for the approach:

- with collision detection (SD55740 \$SCS_MEA_FUNCTION_MASK Bit0/Bit16=1):
With SD55636 \$SCS_MEA_FEED_FEEDAX_VALUE the traversing feed is performed in the infeed axis (applicable).
If the probe switches when these intermediate positions are approached, the movement is stopped and the alarm "Probe collision" is output.
- without collision detection (SD55740 \$SCS_MEA_FUNCTION_MASK Bit0/Bit16=0):
The intermediate positions are approached with the maximum axis velocity (rapid traverse) in per cent as specified in SD55632 \$SCS_MEA_FEED_RAPID_IN_PERCENT.
With SD55632 \$SCS_MEA_FEED_RAPID_IN_PERCENT=0 and SD55632 \$SCS_MEA_FEED_RAPID_IN_PERCENT=100 the maximum axis velocity is effective.

55637	MEA_FEED_POS_DEG	-	-
-	Feedrate when positioning the rotary axes between the measurements	DOUBLE	Immediately
-			
-	-	360	0
		100000	7/7
			U

Description:

Feedrate when positioning a rotary axis between the individual measurements with kinematic measuring (CYCLE9960). The value is always interpreted in degrees/min.

55638	MEA_FEED_FAST_MEASURE	-	-
mm/min	Rapid measuring feed	DOUBLE	Immediately
-			
-	-	900	0
		100000	7/7
			U

Description:

Rapid measuring feed

Note:

If necessary, adjust the value of the velocity to the probe type used and to the machine characteristics!

This means that the maximum deflection of the actual probe type must be considered!!

The use of "Rapid measuring feed" depends of SD55740 \$SCS_MEA_FUNCTION_MASK Bit4!

2.5 Machine and setting data cycles

55640	MEA_FEED_CIRCLE			-	-	
mm/min	Circular feed for measuring circle segment and measuring ball / 3 balls			DOUBLE	Immediately	
-						
-	-	1000	0	100000	7/7	U

Description: MEA_FEED_CIRCLE
 Circular feed for measuring circle segment and measuring ball / 3 balls

55642	MEA_EDGE_SAVE_ANG			-	-	
degrees	Additional safe angle for measuring corner			DOUBLE	Immediately	
-						
-	-	0	0	10	7/7	U

Description: Set \$SCS_MEA_EDGE_SAVE_ANG=10 for compatibility programs.
 The set angle is added to the measured angle as a safety angle.

55644	MEA_KIN_DM_TOL			-	-	
mm	Measure kinematics: Tolerance of diameter of calibration ball			DOUBLE	Immediately	
-						
-	-	0	0	1	7/4	U

Description: Measure kinematics: Tolerance of diameter of calibration ball
 If \$SCS_MEA_KIN_DM_TOL > 0, the measurement of the kinematics (CYCLE996) also checks
 whether the measured diameter
 of the calibration ball lies within the tolerance value in \$SCS_MEA_KIN_DM_TOL.

55645	MEA_KIN_MODE			-	-	
-	Free component of the linear vector			BYTE	Immediately	
-						
-	2	0	0	20	7/4	M

Description: Free component of the linear vector
 Units digit
 0 = calculate all components of the linear vector
 1 = take over free component for X from \$SCS_MEA_KIN_VALUE
 2 = take over free component for Y from \$SCS_MEA_KIN_VALUE
 3 = take over free component for Z from \$SCS_MEA_KIN_VALUE
 4 = retain free component for X from active transformation
 5 = retain free component for Y from active transformation
 6 = retain free component for Z from active transformation
 Tens digit
 0 = vector chain closed, only with tool carrier (55645[0] for the head chain,
 55645[1] for the table chain)
 1x = vector chain open, only with tool carrier (55645[0] for the head chain,
 55645[1] for the table chain)

55646	MEA_KIN_VALUE			-	-	
mm	Measure kinematics completely: value of the linear vector			DOUBLE	Immediately	
-						
-	2	0	-	-	7/4	U

Description: Perform complete kinematics measurement: Value of the linear vector
 SD55646[0] Value for rotary axis 1

SD55646[1] Value for rotary axis 2

See SD55645

55647	MEA_KIN_MIN_ANG_TRIANGLE	-	-
degrees	Minimum interior angle of the measurement triangle	DOUBLE	Immediately
-	-	-	-
-	-	10	2
-	-	60	7/4
-	-	-	U

Description: Perform complete kinematics measurement
Valid for 3 measuring points only. Minimum interior angle of the measuring triangle.
Value range 2 to 60 degrees

55648	MEA_KIN_MIN_ANG_POS	-	-
degrees	Minimum angle range when positioning a rotary axis	DOUBLE	Immediately
-	-	-	-
-	-	10	10
-	-	180	7/4
-	-	-	U

Description: Perform complete kinematics measurement
Minimum measuring range of a rotary axis. If the measuring range of a rotary axis is less than 90°, then inaccuracies caused by measuring inaccuracies in the micrometer range of the probe can be expected.
Value range 10 to 180 degrees

55649	MEA_KIN_BALL_VEC	-	-
-	Perform complete kinematics measurement: Vector of the ball mounting	DOUBLE	Immediately
-	-	-	-
-	3	0	-
-	-	-	7/4
-	-	-	U

Description: Perform complete kinematics measurement: Vector of the ball mounting

55700	MEA_SIMULTAN_LIMIT	-	-
mm	Simultaneous measuring, overrun travel	DOUBLE	Immediately
-	-	-	-
-	-	1	0.5
-	-	5	7/5
-	-	-	U

Description: Maximum permissible difference between switching point of 1st and 2nd probes with simultaneous measuring (MD51740 bit14)

55701	MEA_SIMULTAN_POS_DEV_MAX	-	-
mm	Simultaneous measurement, maximum position deviation between the probes	DOUBLE	Immediately
-	-	-	-
-	-	0.02	0
-	-	1	7/5
-	-	-	U

Description: Maximum permissible difference in position deviation between the 1st and 2nd probes with simultaneous measurement (MD51740 bit14)

55730	MEA_PROTOCOL_USER_EXT	-	-
-	File extension for application protocol	STRING	Immediately
-	-	-	-
-	-	TXT	-
-	-	-	7/4
-	-	-	U

Description: File extension for application protocol

2.5 Machine and setting data cycles

55740	MEA_FUNCTION_MASK	-	-
-	Function mask for measuring cycles, workpiece and tool measuring	DWORD	Immediately
-			
-	-	65537	-
-	-	-	7/4
-	-	-	M

Description:

Function mask for measuring cycles

Bit 0: Collision monitoring using workpiece probe for intermediate positioning

In JOG mode, collision monitoring is always activated.

0: No collision monitoring

1: For positioning operations executed by the measuring cycles between the measurement points, motion is interrupted, as soon as the probe supplies a switching signal. An alarm message is output (Alarm 61302).

Bit 1: Workpiece measurement with 3D-probe, coupling of the spindle alignment with the coordinate rotation around the

infeed axis of the active plane (Z axis for G17)

In JOG mode, the coupling is always activated.

0: no coupling between the spindle alignment and coordinate rotation

The trigger data are automatically corrected.

1: For 3D and star probes (tool type 710, 714) the spindle is aligned depending

on the coordinate rotation around the infeed axis of the active plane.

The positioning direction of the spindle is defined by SD55740

\$SCS_MEA_FUNCTION_MASK bit2.

Caution

The coupling or the correction calculation is cancelled via the measuring cycle without issuing an alarm message if one of the following conditions applies:

- No TRAORI orientation transformation and no tool holder that can be oriented, TCARR (CYCLE800) is active and, in addition to the rotation around Z, additional rotations are active that are not identical between measurement and calibration.
- The working spindle is not position-controlled (SPOS not possible).
- The spindle position between calibration and measurement is not identical.

Bit 2: Workpiece measurement, for coupling of the spindle position, reverse the positioning direction,

Function refers to SD55740 \$SCS_MEA_FUNCTION_MASK, bit1 = 1

0: Spindle positioning is based on the standard.

1: Spindle positioning is realized in the opposite direction (adapted angular values).

Example:

Angle of the coordinate rotation in the plane 90°

if bit2 = 0, spindle is positioned to 270°

if bit2 = 1, spindle is positioned to 90°

Bit 3: Workpiece measurement, number of repeated measurements if the probe does not switch

In the JOG mode, the measurement is not repeated.

0: Measurements are repeated up to 4 times, then a measuring cycle alarm (alarm 61301) is output.

1: Measurement is not repeated if the probe does not switch, a measuring cycle alarm

is output (alarm 61301).

Bit 4: Workpiece measurement, 1st probing for each measurement with fast measuring feedrate

0: When measuring, the measurement velocity saved in the calibration data is effective.

1: "Fast measuring feed rate (SD 55638 \$SCS_MEA_FEED_FAST_MEASURE) is used. After the first probing, the probe retracts through 2 mm.

After this, the measurement is realized with the measurement velocity saved in the calibration data.

The "Fast measurement feedrate" function is not executed if the measurement distance is less than 1 mm!

Bit 5: Workpiece measurement, fast retraction after measuring

0: The retraction after measurement is realized with the same velocity as for

intermediate positioning (SD 55634 \$SCS_MEA_FEED_PLANE_VALUE).

Is only active when collision monitoring is active (SD55740 \$SCS_MEA_FUNCTION_MASK, bit0 = 1).

1: The retraction after measurement is realized with the percentage rapid traverse velocity defined in SD 55632 \$SCS_MEA_FEED_RAPID_IN_PERCENT

.

Is only active when collision monitoring is active (SD 55740 \$SCS_MEA_FUNCTION_MASK, bit0 = 1).

Bit 6: Workpiece measurement, probe activation-deactivation while the spindle is being positioned

0: Workpiece probe is not deactivated before positioning the spindle.

1: Spindle positioning is realized centrally in the manufacturer's cycle CUST_MEACYC.

The machine manufacturer has the option of activating and reactivating the probe before and after spindle positioning.

Bit 7: Kinematic measurement, scaling based on the input values of the rotary axis vectors

0: Scaling based on the calculated rotary axis vectors (V1xyz, V2xyz)

1: Scaling based on the rotary axis vectors saved in the swivel data set (V1xyz, V2xyz)

The swivel data set is displayed under start-up, "Swivel cycle data".

Bit 8: Kinematic measurement: measuring with active swivel (TCARR) or active TRAORI

0: Measurement without active swivel (TCARR) or without active TRAORI

In the cycle, when measuring, the corresponding orientation transformation is deactivated, and reactivated after the measurement has been made.

1: Measurement with active swivel (TCARR) or with active TRAORI

For measurement, the corresponding orientation transformation remains active.

If no orientation transformation is active, then alarm 61167 is output.

Bit 9: Measure kinematics, user-specific scaling of rotary axis vectors V1xyz and V2xyz

0: Scaling of rotary axis vectors V1xyz und V2xyz as unit vector

1: User-specific scaling of rotary axis vectors V1xyz and V2xyz

With user-specific scaling, one vector component is always 1 or -1.

The other two vector components are correspondingly converted by a factor.

Bit 10: Complete kinematic measurement with reference

0: Measuring without reference (compatibility)

1: Measuring with reference with swivel heads

The reference comprises the "Measure reference head" functions

and "Adjust head to reference head". See CYCLE9960

Bit 11: Measure kinematics, number of measuring points for measuring the calibration ball

- 0: 10 Measuring points for measuring on circular path (compatibility)
- 1: 8 Measuring points for measuring on circular path

10 measuring points are always approached for paraxial measurement

Bit 12: Kinematics, change cancel alarms for tolerance monitoring to reset alarms

- 0: If the tolerance of the linear or rotary axis vector is exceeded, cancel alarm 62317 or. 62318 is output.
- 1: Instead of the cancel alarms, the reset alarms 61362 and 61363 are output for tolerance monitoring of linear and rotary axis vectors

Bit 13: Kinematics, scaling/fixed value setting of closing vector

- 0: With the scaling/fixed value setting, the value is set in the vectors written in the kinematics (I2/I3).
- 1: With the scaling/fixed value setting, the value is set in the closing vector.

Example: Table kinematics, the value for rotary axis 2 is used in I4.

Bit 15: Workpiece measurement, calibration radius with starting point at the center of the ring, JOG mode

- 0: The starting point for calibration, radius need not be precisely located at the center of the calibration ring.
- 1: The starting point for calibration, radius must be precisely located at the center of the calibration ring.

Bit 16: Collision monitoring using tool probe for intermediate positioning.

In JOG mode, collision monitoring is always activated.

- 0: No collision monitoring
- 1: For positioning operations which are executed by measuring cycles between the measurement points, motion is interrupted as soon as the probe supplies a switching signal.

An alarm message is output (alarm 61302).

Bit 17: Workpiece measurement, number of repeated measurements if the probe does not switch.

In JOG mode, a measurement is not repeated.

- 0: Measurements are repeated a maximum of 4 times, then a measuring cycle alarm (alarm 61301) is output.
- 1: The measurement is not repeated if the probe does not switch, a measuring cycle alarm is output (alarm 61301).

Bit 19: Tool measurement: retraction velocity from the measuring point

- 0: The retraction from the measuring point is realized with the same velocity as for intermediate positioning (SD55634 \$SCS_MEA_FEED_PLANE_VALUE).
- 1: The retraction velocity is realized with the percentage rapid traverse velocity specified in SD55632 \$SCS_MEA_FEED_RAPID_IN_PERCENT and is only effective when collision monitoring is active (SD55740 \$SCS_MEA_FUNCTION_MASK, bit16 = 1).

Bit 28: Selection of new or continuous protocol for standard protocol measurement in JOG

- 0: New protocol (default)
- 1: Continuous, in other words, it is always appended to an existing protocol

Bit 29: File format selection for standard protocol measurement in JOG

0: Text format (default)

1: Table format

55774	J_MEA_PROTOCOL_FILE			-	-	
-	Name and path of protocol file for measurement in JOG			STRING	Immediately	
-						
-	-	//NC:/WKS.DIR/ TEMP.WPD/ J_MEAPROT.TXT	-	-	7/4	U

Description: Name and path of protocol file for measurement in JOG

55800	ISO_M_DRILLING_AXIS_IS_Z			-	-	
-	Drilling axis depends on the plane / always Z			BYTE	Immediately	
-						
-	-	0	0	1	7/6	U

Description: Selection of the drilling axis

0: drilling axis is vertical to the active plane

1: drilling axis is always "Z", independently of the active plane

55802	ISO_M_DRILLING_TYPE			-	-	
-	Tapping type			BYTE	Immediately	
-						
-	-	0	0	3	7/6	U

Description: Tapping type

0: tapping without compensating chuck

1: tapping with compensating chuck

2: deep hole tapping with chip breakage

3: deep hole tapping with stock removal

55804	ISO_M_RETRACTION_FACTOR			-	-	
%	Factor for retraction speed (0...200%)			DWORD	Immediately	
-						
-	-	100	0	200	7/6	U

Description: Factor for retraction speed (0...200%)

55806	ISO_M_RETRACTION_DIR			-	-	
-	Retraction direction at G76/87			BYTE	Immediately	
-						
-	-	0	0	4	7/6	U

Description: Retraction direction for precision drilling and reverse countersinking G76/G87

0: G17(-X) G18(-Z) G19(-Y)

1: G17(+X) G18(+Z) G19(+Y)

2: G17(-X) G18(-Z) G19(-Y)

3: G17(+Y) G18(+X) G19(+Z)

4: G17(-Y) G18(-X) G19(-Z)

2.5 Machine and setting data cycles

55807	ISO_M_TAPPING_SET_MC	-	-
-	Setting tapping G84: Spindle mode/position control	DOUBLE	Immediately
-			
-	-	0	0
-	-	1	7/4
-	-	0	M

Description: Setting when rigid tapping (G84)
 0= with G84, reactivate spindle mode
 1= with G84, remain in position-controlled spindle mode

55808	ISO_T_RETRACTION_FACTOR	-	-
%	Factor for retraction speed	DWORD	Immediately
-			
-	-	100	0
-	-	200	7/6
-	-	U	

Description: Factor (1-200%) for retraction speed at tapping G84/G88

55810	ISO_T_DWELL_TIME_UNIT	-	-
-	Dwell time evaluation	BYTE	Immediately
-			
-	-	0	0
-	-	1	7/6
-	-	U	

Description: Dwell time evaluation for deep hole drilling G83/G87
 0: seconds
 1: revolutions

55818	ISO_M_FUNCTION_MASK	-	-
-	Function mask for ISO milling mode	DWORD	Immediately
-			
-	-	0	-
-	-	-	7/4
-	-	M	

Description: Function mask for ISO milling mode

55819	ISO_T_FUNCTION_MASK	-	-
-	Function mask for ISO turning mode	DWORD	Immediately
-			
-	-	0	-
-	-	-	7/4
-	-	M	

Description: Function mask for ISO turning mode
 Bit 0: Execution of residual corner cut
 0: Complete residual corner cut is executed (compatibility)
 1: Without complete residual corner cut
 Bit 1: Stock removal roughing (G71/G72) without tool nose radius compensation
 0: Roughing with active tool nose radius compensation (with G41/G42, compatibility)
 1: Roughing without tool nose radius compensation (with G40)

55820	FRICT_OPT_RADIUS	-	-
mm	Circle radius for optimizing friction compensation	DOUBLE	Immediately
-			
-	-	5	0
-	-	5000	7/4
-	-	M	

Description: MEA_FEED_CIRCLE
 Circle radius for optimizing friction compensation

55821	FRICT_OPT_RADIUS_ROT			-	-	
degrees	Circle radius for optimizing friction compensation			DOUBLE	Immediately	
-						
-	-	5	0	5000	7/4	M

Description: MEA_FEED_CIRCLE
Circle radius for optimizing friction compensation

55822	FRICT_OPT_FEED				-	-	
mm/min	Feedrates for optimizing friction compensation				DOUBLE	Immediately	
-							
-	9	70,140,350,560,700,1060,1410,1770,2120	0	100000	7/4	M	

Description: Setting data contains feedrate values for optimizing friction compensation.

55823	FRICT_OPT_FEED_ROT			-	-	
rev/min	Feedrates for optimizing friction compensation for rotary axes			DOUBLE	Immediately	
-						
-	9	0.2,0.4,1.0,1.5,2.0,3.0, 3.9,5.0,5.9	0	100	7/4	M

Description: Setting data contains the feedrate values for optimizing friction compensation for rotary axes.

55824	FRICT_OPT_STEP			-	-	
-	Step number for optimizing friction compensation			DWORD	Immediately	
-						
-	-	0	0	1000	7/4	M

Description: Step number for optimizing friction compensation

55826	FRICT_OPT_ACT_STEP			-	-	
-	Current step number for optimizing friction compensation			DWORD	Immediately	
-						
-	-	0	0	1000	7/4	M

Description: Displays current step number for optimizing friction compensation

55828	FRICT_OPT_DIR_MINUS			-	-	
-	Direction of rotation for optimizing friction compensation			DWORD	Immediately	
-						
-	-	0	0	1	7/4	M

Description: Direction of rotation for optimizing friction compensation
0= Travel in positive direction (G03)
1= Travel in negative direction (G02)

55844	GRIND_MEA_KIN_TOL			-	-	
mm	Kinematik measurement: Tolerance of kinematic vectors			DOUBLE	Immediately	
-						
-	-	1	0	5	7/4	U

Description: Measure kinematics: Tolerance of kinematic vectors
When the kinematics are measured (CYCLE496), it is checked whether the measured vectors

2.5 Machine and setting data cycles

lie within the tolerance value of setting data \$SCS_GRIND_MEA_KIN_TOL.

55880	GRIND_CONT_RELEASE_ANGLE			-	-	
degrees	Grinding - profiling: retraction angle			DOUBLE	Immediately	
-						
-	-	45	0	90	7/4	M

Description: This setting data specifies the angle of retraction from the contour during profiling.

55881	GRIND_CONT_RELEASE_DIST			-	-	
mm	Grinding - profiling: retraction value			DOUBLE	Immediately	
-						
-	-	1	0	10	7/4	M

Description: This setting data defines the value by which the tool is retracted in both axes during profiling.

55884	GRIND_CONT_BLANK_OFFSET			-	-	
mm	Grinding - profiling: blank allowance			DOUBLE	Immediately	
-						
-	-	1	0	100	7/4	M

Description: This setting data specifies the distance from the grinding wheel at which there is a switch from G0 to G1 during profiling.

2.6 Compile cycles

61516	CC_PROTECT_PAIRS			-	-	
-	Axis collision protection configuration			DWORD	Reset	
-						
-	20	0	-	-	7/2	M

Description: This MD defines the axis pairs that must be protected against mutual collision. The machine axis number of the first axis is entered in the decades of 1s and 10s. The number of the second machine axis must be entered in the decades of 100s and 1000s.

Example:

```
$MN_CC_PROTECT_PAIRS[0] = 1201 ; axis_1 = 1   axis_2 = 12
```

When zero is entered, collision protection is deactivated.

61517	CC_PROTECT_SAFE_DIR			-	-	
-	Axis collision protection. Definition of the retraction direction.			DWORD	Reset	
-						
-	20	0	-	-	7/2	M

Description: In this MD the direction of retraction for both axes of a collision-protected axis pair is entered. Entry in the decade of 1s and 10s defines the direction of retraction of the first axis. Entry in the decade of 100s and 1000s defines that of the second axis. A value > 0 means retraction in the plus direction. 0 means retraction in the minus direction.

The value can only be changed only if collision protection for the axis pair is inactive!

61518	CC_PROTECT_OFFSET			-	-	
mm, degrees	Axis collision protection. Position offset			DOUBLE	Reset	
-						
-	20	0.0	-	-	7/2	M

Description: Position offset for the collision detection of the two axes defined in MD_60972.

The following applies to calculation of distance d between axes AX1 and AX2:

```
d = abs( POS[AX1] + $MN_CC_PROTECT_OFFSET[ n ] - POS[AX2] )
```

The axis collision protection function guarantees that the following condition is always fulfilled:

```
d > $MN_CC_PROTECT_WINDOW+$MN_CC_PROTECT_WINDOW_EXTENSION[ n ]
```

This considers the current axis velocities and the acceleration/braking capacities of the axes in order to be able to brake the axes in time if required.

The value can be changed only if collision protection for the axis pair is inactive!

61519	CC_PROTECT_WINDOW			-	-	
mm, degrees	Axis collision protection. Minimum distance			DOUBLE	Reset	
-						
-	20	10.0	0.0	10000.0	7/2	M

Description: Minimum distance that must be kept by the axes.

The value can be changed even if the protection is active. In this case, however, the axes must have a safe distance between them.

2.6 Compile cycles

61532	CC_PROTECT_DIR_IS_REVERSE			-	-	
-	Axis collision protection. Detection of the reversed direction.			DWORD	Reset	
-						
-	20	0	-	-	7/2	M

Description: This machine data is used to detect the reversed direction of the axes of a collision-protected pair of axes.

61533	CC_PROTECT_WINDOW_EXTENSION			-	-	
mm, degrees	Axis collision protection. Increase in the minimum distance			DOUBLE	NEW CONF	
-						
-	20	0.0	0.0	10000.0	7/2	M

Description: Increasing the distance that must be kept from the axes.
The value can be changed even if the protection is active in the part program.

61534	CC_PROTECT_A_DBD_INDEX			-	-	
-	Axis collision protection. Defining the \$A_DBD index			DWORD	Reset	
-						
-	-	-1	-	-	7/2	M

Description: The global axis screenform of axes, where braking operations are initiated due to the violation of the protection window, is mapped to variable \$A_DBD. The index is defined using this machine data. For index -1, an axis screenform is not output.

61535	CC_PROTECT_OPTIONS			-	-	
-	Axis collision protection options			DWORD	Reset	
-						
-	20	0	0	1	7/2	M

Description: This MD specifies the additional options. The following options can be activated:
Bit 0: Activation of the protection pair by DB3#.DBB24.3 of an axis of the protection pair

62500	CLC_AXNO			-	-	
-	Axis assignment for clearance control			DWORD	PowerOn	
-						
-	-	0	-2	CC_MAXNUM_A XES_PER_CHA N	7/2	M

Description: n=0: Deactivates the clearance control
n > 0:
Activates the 1D clearance control for the channel axis with the axis number indicated under n. This axis must not be a modulo rotary axis.
n < 0: Activates the 3D clearance control.
Activation of the 3D clearance control requires configuration of at least one of the two possible 5-axis transformations in the channel.
-1: with n = -1 the first 5-axis transformation (16 <=transformer type <=149) configured with \$MC_TRAFO_TYPE_n in the 1st channel is selected for clearance control.
-2: with n = -2 the second 5-axis transformation configured in the 1st channel is selected.
The overlaid motion acts on the axes configured as linear axes in the first three elements of \$MC_TRAFO_AXES_IN_n of the selected transformation.
Configuration of 3- and 4-axis transformations is permissible (2D clearance control).

Restriction:

- Only one of the linear axes involved in clearance control must be configured as master axis of a gantry grouping.
- No axis of the clearance control must be configured as slave axis of a gantry grouping.
- Erroneous configurations are rejected after power ON with CLC alarm 75000.

62502	CLC_ANALOG_INPUT	-	-
-	Analog input for clearance control	DWORD	-
-			
-	-	1	1
		8	7/2
			M

Description: The machine data defines the number of the analog input that is used for the clearance sensor.

Differing from the functions realized in the interpolator (synchronized actions) the input of the clearance control cannot be influenced via PLC interface DB10 DBW148ff.

62504	CLC_SENSOR_TOUCHED_INPUT	-	-
-	Input bit assignment for "Sensor collision" signal	DWORD	PowerOn
-			
-	-	0	-40
		40	7/2
			M

Description: This machine data defines the digital input that is used for collision detection.

Requirements:

- The clearance sensor has a "sensor collision" signal.
- The numbering of the digital inputs corresponds to the numbering of the corresponding system variables: \$A_IN[n], with n = number of the digital input.
- Example: 3rd input on the 2nd input byte: \$MC_CLC_SENSOR_TOUCHED_INPUT = 11 ; 3 + 1 * 8

Negative values result in the corresponding input signal being used internally inverted (fail-safe).

See section 2.4, /TE1/ for sensor collision detection.

62505	CLC_SENSOR_LOWER_LIMIT	-	-
mm, degrees	Lower motion limit of the clearance control	DOUBLE	Reset
-			
-	2	-5.0, -10.0	-1.0e40
		0.0	7/2
			M

Description: This machine data consists of 2 field elements:

- CLC_SENSOR_LOWER_LIMIT[0]

With the first field element the lower limit for the deviation from the sensor-controlled machine position from the programmed position is entered.

As soon as the limit is reached, PLC signal DB21.DBX37.4 is set and CLC alarm 75020 is displayed:

- CLC_SENSOR_LOWER_LIMIT[1]

The second field element limits the value of the maximum lower motion limit that can be programmed.

62506	CLC_SENSOR_UPPER_LIMIT	-	-
mm, degrees	Upper motion limit of the clearance control	DOUBLE	Reset
-			
-	2	+10.0, +40.0	0.0
		+1.0e40	7/2
			M

Description: This machine data consists of 2 field elements:

- CLC_SENSOR_UPPER_LIMIT[0]

2.6 Compile cycles

With the first field element the upper limit for the deviation from the sensor-controlled machine position from the programmed position is set.

As soon as the limit is reached, PLC signal DB21.DBB37.5 is set and CLC alarm 75021 is displayed.

- CLC_SENSOR_UPPER_LIMIT[1]

The second field element limits the value of the maximum upper motion limit that can be programmed.

62508	CLC_SPECIAL_FEATURE_MASK			-	-	
-	Special functions and CLC modes			DWORD	PowerOn	
-						
-	-	0x3	-	-	7/2	M

Description:

Bit 0 and bit 1:

Alarm reaction on reaching the CLC motion limits: This machine data configures the alarm reaction on reaching the motion limits set with MD 62505 and MD 62506 or programmed with CLC_LIM .

Bit 0 = 0: Alarm 75020 does not stop program execution. The alarm can be acknowledged by pressing the Cancel key.

Bit 0 = 1: Alarm 75020 stops program execution at the lower limit. The alarm can only be acknowledged with reset.

Bit 1 = 0: Alarm 75021 does not stop program execution. The alarm can be acknowledged by pressing the Cancel key.

Bit 1 = 1: Alarm 75021 stops program execution at the upper limit. The alarm can only be acknowledged with reset.

Bit 4:

Operation as online tool length compensation in orientation direction

Bit 4 = 0: Clearance control works as usual.

Bit 4 = 1: Unlike the clearance control mode the analog input does not specify a velocity, but directly an offset position instead. In this case, the ordinate of the selected sensor characteristic \$MC_CLC_SENSOR_VELO_TABLE_x is interpreted in mm or inch instead of in mm/min (inch/min).

This operating mode can be used for testing purposes and for implementing a 3D tool length compensation. The analog value is thereby not read in in position controller cycle, but in IPO cycle. In this operating mode, a normal influence or definition of the analog values by the PLC is possible via DB10 DBW148ff. The input used must have been activated through the following machine data: MD 10300 \$MN_FASTIO_ANA_NUM_INPUTS

Bit 5:

Mode for rapid retraction in position controller cycle

Bit 5 = 0: Clearance control works as usual.

Bit 5 = 1: The analog input is inactive. If the digital input configured with MD 62504 is activated (inverted, if required), a retraction motion will start in the same position controller cycle that corresponds to an analog signal specification of +10V during operation as "Online tool length compensation" (see bit 4).

The digital input signal that starts the retraction movement cannot be influenced by the PLC. In addition to the reaction in the position controller, the input "sensor collision" and the subsequent stop of the path motion is handled in the interpolator. This signal branch can be influenced by the PLC through default signals DB10 DBB0ff.

Bit 8:

Mode for alarm output when the lower motion limit is reached.

Bit 8 = 0: Alarm 75020 is displayed.

Bit 8 = 1: Alarm 75020 will not be displayed, if the alarm reaction after reaching of the CLC movement limits (bit 0) was configured without program execution stop: bit 0 = 0

Bit 9:

Mode for alarm display when the upper motion limit is reached.

Bit 9 = 0: Alarm 75021 is displayed.

Bit 9 = 1: Alarm 75021 will not be displayed, if the alarm reaction on reaching the CLC motion limits (bit 0) was configured without program execution stop: bit 1 = 0

Bit 14:

Synchronization of the start position with single-axis clearance control.

Bit 14 = 0: If the clearance control has been configured for one axis only (MD62500), the current actual position of the next part program block on clearance control power OFF with CLC(0) is synchronized for this axis only.

Bit 14 = 1: If the clearance control has been configured for one axis only (MD62500), the actual current positions of the next part program block on clearance control power OFF with CLC(0) are synchronized for all axes.

This setting is required only for those applications for which a single-axis clearance control is used together with a 3/4/5-axis transformation (e.g. pipe cutting with rotating workpiece) and when an axis jump in the CLC axis or alarm: "Channel %1 Axis %2 System error 550010" occur at the first traversing block after CLC (0).

62510	CLC_SENSOR_VOLTAGE_TABLE_1				-	-	
V	Coordinate voltage sensor characteristic 1				DOUBLE	Reset	
-							
-	2	-10.0, 10.0, 0.0, 0.0, 0.0	-10.0	10.0	7/2	M	

Description:

This machine data defines the voltage values of sensor characteristic 1. The corresponding velocity value must be entered under the same index i of this machine data:

MD62511 \$MC_CLC_SENSOR_VELO_TABLE_1[i]

For the simplest case it will suffice to define the characteristic via two interpolation points as a symmetrical straight through the zero point:

Example:

- \$MC_CLC_SENSOR_VOLTAGE_TABLE_1[0] = -10.0 ; Volt
- \$MC_CLC_SENSOR_VOLTAGE_TABLE_1[1] = 10.0 ; Volt
- \$MC_CLC_SENSOR_VELO_TABLE_1[0] = 500.0 ; mm/min
- \$MC_CLC_SENSOR_VELO_TABLE_1[1] = -500.0 ; mm/min

For all field elements of the machine data not used in the example value 0.0 must be set.

If the defined sensor characteristic creates an incorrect control direction, i.e. after power ON of the clearance control the sensor "flees" from the workpiece, the control direction can be corrected either by reversing the polarity of the sensor signal at the I/O module, or by changing the sign in front of the voltage values in the machine data.

Notes on how to define the sensor characteristic:

- A point with velocity value 0 must not stand at the end of the table.
- The characteristic must be monotonic, i.e. the velocity values above the voltage must either only rise or only fall.
- The characteristic must not have any jumps in the velocity sequence, i.e. it is not permissible to define different velocities for the same voltage value.
- The characteristic must have at least two interpolation points.
- Do not enter more than 5 interpolation points (3 for 840D prior to SW 5.3) with positive or with negative velocity.
- Characteristics that do not go directly through the zero point may influence the clearance normalization set on the clearance sensor.

2.6 Compile cycles

62511	CLC_SENSOR_VELO_TABLE_1			-	-	
mm/min	Coordinate velocity sensor characteristic 1			DOUBLE	Reset	
-						
-	2	2000.0/60.0, -2000.0/60.0, 0.0, 0.0, 0.0	-	-	7/2	M

Description: This machine data defines the velocity values of sensor characteristic 1. The corresponding voltage value must be entered under the same index i of the machine data:
MD62510 \$MC_CLC_SENSOR_VOLTAGE_TABLE_1[i]
Additional information on how to define the characteristic is available in the description of machine data MD62510.

62512	CLC_SENSOR_VOLTAGE_TABLE_2				-	-	
V	Coordinate voltage sensor characteristic 2				DOUBLE	Reset	
-							
-	2	-10.0, 10.0, 0.0, 0.0, 0.0	-10.0	10.0	7/2	M	

Description: This machine data defines the voltage values of sensor characteristic 2.
Additional information on how to define the characteristic is available in the description of machine data MD62510.

62513	CLC_SENSOR_VELO_TABLE_2			-	-	
mm/min	Coordinate velocity sensor characteristic 2			DOUBLE	Reset	
-						
-	2	2000.0/60.0, -2000.0/60.0, 0.0, 0.0, 0.0	-	-	7/2	M

Description: This machine data defines the voltage values of sensor characteristic 2.
Additional information on how to define the characteristic is available in the description of machine data MD62510.

62516	CLC_SENSOR_VELO_LIMIT			-	-	
%	Velocity of the clearance control motion			DOUBLE	Reset	
-						
-	-	100.0	-200.0	200.0	7/2	M

Description: 1D clearance control:
This machine data defines the maximum traversing velocity of the overlaid control motion as a percentage value of the max. residual axis velocity from the maximum value (MD32000 \$MA_MAX_AX_VELO[AX#]) of the next clearance-controlled axis.
2D/3D clearance control
With 2D or 3D clearance control the maximum velocity of the slowest clearance-controlled axis multiplied with the root of 2 or with the root of 3 is used as reference value.

62517	CLC_SENSOR_ACCEL_LIMIT			-	-	
%	Acceleration of the clearance control movement			DOUBLE	Reset	
-						
-	-	100.0	0.0	200.0	7/2	M

Description: 1D clearance control:
This machine data defines the maximum acceleration of the overlaid control motion as a percentage value of the max. residual axis velocity from the maximum value (MD32300 \$MA_MAX_AX_ACCEL[AX#]) of the next clearance-controlled axis.

2D/3D clearance control:

With 2D or 3D clearance control the maximum velocity of the slowest clearance-controlled axis multiplied with the root of 2 or with the root of 3 is used as reference value.

62520	CLC_SENSOR_STOP_POS_TOL	-	-
mm, degrees	Pos. tolerance for status report "CLC standstill"	DOUBLE	Reset
-			
-	-	0.05	0.0
		1.0e40	7/2
			M

Description:

With the clearance control active and in order to achieve the exact stop condition (G601/G602), not only the axis involved in the programmed traversing motion, but also the clearance-controlled axes must have reached their exact stop conditions.

The exact stop condition of the clearance control is defined via a position window and a dwell time:

- MD62520 \$MC_CLC_SENSOR_STOP_POS_TOL
- MD62521 \$MC_CLC_SENSOR_STOP_DWELL_TIME

If the clearance control or the clearance-controlled axes are within the position tolerance during the parameterized dwell time, the exact stop condition of the clearance control is fulfilled.

Setting notes:

If the clearance control should not be able to keep the parameterized position window for the corresponding dwell time, the following alarm will be displayed in certain situations:

- Alarm "1011 Channel Channel number System error 140002"

In order to avoid the alarm or in case the alarm occurred, the following measures must be taken:

1. Switch on the clearance control with the typical machining clearance between the clearance sensor and a small metal sheet.
2. Tap on the metal sheet so that the laser head performs visible adjustment motions. After these adjustment movements are completed, do not touch the metal sheet again.
3. If the interface signal DB3x.DBX60.7 (position reached with fine exact stop) "flickers" after the tapping or after release of the process gas, the following machine data will have to be adjusted:

- MD36010 \$MA_STOP_LIMIT_FINE (increase)
- MD62520 \$MC_CLC_SENSOR_STOP_POS_TOL (increase)
- MD62521 \$MC_CLC_SENSOR_STOP_DWELL_TIME (shorten)

The changes to the machine data will become active only after NCK RESET. The clearance control therefore may have to be switched on again after NC start.

62521	CLC_SENSOR_STOP_DWELL_TIME	-	-
s	Wait time for "CLC standstill"	DOUBLE	Reset
-			
-	-	0.1	0.0
		1.0e40	7/2
			M

Description:

This machine data defines the dwell time for reaching the exact stop conditions of the clearance control.

The corresponding position tolerance must be entered in machine data:

- MD62520 \$MC_CLC_SENSOR_STOP_POS_TOL

Additional information on the exact stop condition of the clearance control is available in the description of machine data MD62520.

Related to:

The set dwell time must not be longer than the maximum delay for reaching the exact stop condition parameterized in the following machine data:

- MD36020 \$MA_POSITIONING_TIME

2.6 Compile cycles

62522	CLC_OFFSET_ASSIGN_ANAOUT			-	-	
-	Assignment of internal additional analog value to sensor signal			DWORD	PowerOn	
-						
-	-	0	-1020008 , -8	1020008 , 8	7/2	M

Description:

This machine data defines the analog output, the output value of which is subtracted from the input voltage of the clearance sensor.

The numbering of the analog output corresponds to the numbering of the relevant system variables: \$A_OUTA[n], with n = number of the analog output.

The analog output can be used through variable \$A_OUTA[n] both block-synchronous from a part program or asynchronous via a synchronized action.

62523	CLC_LOCK_DIR_ASSIGN_DIGOUT			-	-	
-	Assignment digital output interlocking CLC			DWORD	PowerOn	
-						
-	2	0, 0	-40	40	7/2	M

Description:

This machine data consists of 2 field elements:

- CLC_LOCK_DIR_ASSIGN_DIGOUT[0]

The first field element defines the digital output through which the negative motion direction of the clearance control can be locked.

- CLC_LOCK_DIR_ASSIGN_DIGOUT[1]

The second field element defines the digital output through which the positive motion direction of the clearance control can be locked.

Entering the negative output number will invert the evaluation of the switching signal.

Example:

Digital output 1 (\$A_OUT[1]) shall lock the negative motion direction; digital output 2 (\$A_OUT[2]) shall lock the positive motion direction:

- MD 62523 \$MC_CLC_LOCK_DIR_ASSIGN_DIGOUT[0] = 1
- MD 62523 \$MC_CLC_LOCK_DIR_ASSIGN_DIGOUT[1] = 2

With the corresponding system variables interlocking of the relevant motion direction can be switched on or off either block-synchronous in the part program or asynchronous via synchronized actions.

- Interlock of the negative motion direction ON/OFF: \$A_OUT[1] = 1 / 0
- Interlock of the positive motion direction ON/OFF: \$A_OUT[2] = 1 / 0

With switching signal inversion (MD 62523 \$MA_CLC_LOCK_DIR_ASSIGN_DIGOUT[0] = -1):

Interlock of the negative motion direction ON/OFF: \$A_OUT[1] = 0 / 1

62524	CLC_ACTIVE_AFTER_RESET			-	-	
-	Clearance control active after RESET			BOOLEAN	PowerOn	
-						
-	-	FALSE	-	-	7/2	M

Description:

1D clearance control:

This machine data parameterizes the RESET behavior (program end RESET or NC RESET) of the 1D clearance control.

- CLC_ACTIVE_AFTER_RESET = 0: after RESET the clearance control is switched off analog to the part program command CLC(0).
- CLC_ACTIVE_AFTER_RESET = 1: after RESET the clearance control maintains its current activation status.

3D clearance control:

This machine data does not effective with a 3D clearance control. The clearance control will in this case always be switched off after RESET.

62525	CLC_SENSOR_FILTER_TIME	-	-
s	Time constant of PT1 sensor filtering	DOUBLE	Immediately
-			
-	-	0.0	0.0
		10.0	7/2
			M

Description: This machine data parameterizes the time constant for the PT1 filter of the clearance control (corresponds to an RC element).

With the PT1 filter, the higher-frequency noise components in the input signal of the clearance control can be diminished.

The filter's effect can be observed through the function-specific display data (see section 2.7, /TEL/).

A value of zero switches the filter off completely.

Note:

Any additional time constant in the control loop reduces the max. achievable control loop dynamics.

62528	CLC_PROG_ORI_AX_MASK	-	-
-	Axis screen for CLC with free direction specification	DWORD	PowerOn
-			
-	-	0x0	-
		-	7/2
			M

Description: Each bit of the axis screen refers to the channel axis[n+1] depending on its bit index n. Only exactly 3 bits may be set according to the three direction axes of the compensation vector. The bits are evaluated in ascending order.

The first channel axis parameterized like that corresponds to the X coordinate of the compensation vector. The second channel axis to the Y coordinate, and so on.

62529	CLC_PROG_ORI_MAX_ANGLE	-	-
degrees	Limit angle for CLC with free direction specification	DOUBLE	Reset
-			
-	-	45.0	0.0
		180.0	7/2
			M

Description: Permissible limit angle between tool orientation and CLC direction defined freely through additional axes.

62530	CLC_PROG_ORI_ANGLE_AC_PARAM	-	-
-	Index of the display variables f. the current differential angle	DWORD	Reset
-			
-	-	-1	-1
		20000	7/2
			M

Description: Index n of system variable \$AC_PARAM[n] in which the current differential angle between tool orientation and CLC direction is output.

62560	FASTON_NUM_DIG_OUTPUT	-	-
-	Configuration of the switching output	BYTE	PowerOn
-			
-	-	0	0
		4	7/2
			M

Description: This machine data assigns the number of the digital onboard output (1...4) to the NCU, on which the fast switching signal is output.

Output of the switching signal is deactivated with 0.

2.6 Compile cycles

62561	FASTON_OUT_DELAY_MICRO_SEC			-	-	
-	Still missing			DWORD	NEW CONF	
-						
-	2	0, 0	-5000	5000	7/2	M

Description: This MD enables separate specification of time delay values for the switch-on and switch-off edge of the fast switching signal.

\$MC_FASTON_OUT_DELAY_MICRO_SEC[0] Time delay of the switch-on edge

\$MC_FASTON_OUT_DELAY_MICRO_SEC[1] Time delay of the switch-off edge

Negative values create a derivative action time for signal output. Positive values cause the output to be delayed. Derivative action time or delay are used to compensate external switching delays. The values must be determined empirically and should not exceed a few 100 microseconds. Values that are larger than approx. a half position control cycle clock will possibly not have a correct effect.

62571	RESU_RING_BUFFER_SIZE			-	-	
-	RESU ring buffer size (block buffer)			DWORD	PowerOn	
-						
-	-	1000	10	1000000	7/2	M

Description: The block buffer includes the geometrical information for the part program. The value entered in the machine data corresponds to the number of loggable part program blocks (with 32 byte / part program block). The block buffer size corresponds to the number of retrace-capable blocks.

62572	RESU_SHARE_OF_CC_HEAP_MEM			-	-	
%	RESU share of the parameterized heap memory			DOUBLE	PowerOn	
-						
-	-	100.0	1.0	100.0	7/2	M

Description: The total heap memory size available for all compile cycles is parameterized by channel-specific machine data MD 28105 \$MC_MM_NUM_CC_HEAP_MEM

The RESU machine data can limit the maximum heap memory share that RESU is to use.

62573	RESU_INFO_SA_VAR_INDEX			-	-	
-	RESU indices of the synchronized action variables used			DWORD	PowerOn	
-						
-	2	-1	-1	10000	7/2	M

Description: Reserved. This machine data must not be used.

62574	RESU_SPECIAL_FEATURE_MASK			-	-	
-	RESU parameterizable behavior			DWORD	PowerOn	
-						
-	-	0x0	0x0	0x0f	7/2	M

Description: With bit settings parameterizable behavior of the RESU function:

Bit 0: reserved. Do not use!

Bit 1:

Bit 1 = 0: (default) RESU main program CC_RESU.MPF is created in the dynamic memory area of the NC (DRAM) (recommended setting)

Bit 1 = 1: RESU main program CC_RESU.MPF is created in the buffered part program memory of the NC (SRAM).

Bit 2:

Bit 2 = 0: (default)

The following RESU-specific subroutines are created as user cycles:

- CC_RESU_INI.SPF
- CC_RESU_END.SPF
- CC_RESU_BS_ASUP.SPF
- CC_RESU_ASUP.SPF

Bit 2 = 1: (recommended setting)

The RESU-specific subroutines (see above) are created as OEM cycles.

Bit 3:

Bit 3 = 0: (default)

No effect (see under bit 3 = 1).

Bit 3 = 1: (recommended setting, if bit 2 = 1)

If the RESU-specific subroutines (see above) are created as OEM cycles and if during NC start RESU-specific subroutines are nevertheless available as user cycles, these will be canceled without prior checkback.

62575	RESU_SPECIAL_FEATURE_MASK_2	-	-
-	RESU additional parameterizable behavior	DWORD	Reset
-			
-	-	0x0	0x0
		0x01	7/2
			M

Description: With bit settings parameterizable behavior of the RESU function:

Bit 0:

Bit 0 = 0: (default)

For continued machining at the contour, a block search with contour calculation beginning at

the part program start is used (recommended setting).

Bit 0 = 1: In order to accelerate that machining is continued, 2 different block search types are used:

- From part program start to the last main block: block search without calculation
- From the last main block to the current part program block: block search with contour calculation

62580	RESU_WORKING_PLANE	-	-
-	RESU determination of the working plane	DWORD	NEW CONF
-			
-	-	1	1
		3	7/2
			M

Description: These machine data determine the working plane for the 2-dim. function RESU. The following settings are possible:

- 1 : for working plane G17 (first and second geometry axis)
- 2 : for working plane G18 (first and third geometry axis)
- 3 : for working plane G19 (second and third geometry axis)

62600	TRAFO6_KINCLASS	-	-
-	Kinematics class	DWORD	NEW CONF
-			
-	-	1	1
		2	7/2
			M

Description: The following kinematics classes can be indicated:

- Standard transformation: 1
- Special transformation: 2

2.6 Compile cycles

62601	TRAFO6_AXES_TYPE			-	-	
-	Axis type for transformation [axis no.]: 0...5			DWORD	NEW CONF	
-						
-	6	1, 1, 1, 3, 3, 3	1	4	7/2	M

Description: This machine data identifies the axis type used in the transformation.
The following axis types can be indicated:

- Linear axis: 1
- Delta/acme spindle drive: 2
- Rotary axis: 3 (4)

62602	TRAFO6_SPECIAL_KIN			-	-	
-	Special kinematics type			DWORD	NEW CONF	
-						
-	-	1	-	-	7/2	M

Description: This machine data identifies the type of special kinematics.
The following special kinematics are available:

- No special kinematics: 1
- 5-axis articulated arm with coupling of axis 2 to axis 3: 2
- 2-axis SCARA with forced coupling to tool: 3
- 3-axis SCARA with degrees of freedom X, Y, A: 4
- 2-articulated arm with coupling of axis 1 to axis 2: 5
- 2-axis articulated arm without coupling of axis 1 to axis 2: 8
- 4-axis SCARA with coupling of axis 1 to axis 2: 7

62603	TRAFO6_MAIN_AXES			-	-	
-	Basic axis identification			DWORD	NEW CONF	
-						
-	-	1	1	7	7/2	M

Description: This machine data identifies the type of basic axis assignment. Normally, the first 3 axes are the basic axes.
The following basic axis assignments are included:

- SS (gantry): 1
- CC (SCARA): 2
- NR (articulated arm): 3
- SC (SCARA): 4
- RR (articulated arm): 5
- CS (SCARA): 6
- NN (articulated arm): 7

62604	TRAFO6_WRIST_AXES			-	-	
-	Identification of the hand axes			DWORD	NEW CONF	
-						
-	-	1	1	6	7/2	M

Description: This machine data identifies the robot hand type. Normally, axes 4 to 6 are the robot hand.
The following hand types are included:

- No hand: 1
- Central hand: 2
- Beveled hand: 3
- Hand with elbow: 5
- Beveled hand with elbow: 6

62605	TRAFO6_NUM_AXES	-	-
-	Number of transformed axes	DWORD	NEW CONF
-			
-	-	3	2
-	-	6	7/2
-	-		M

Description: This machine data identifies the number of axes involved in the transformation.
Package 2.3 (810D) or 4.3 (840D) support kinematics with a max. of 5 axes.

62606	TRAFO6_A4PAR	-	-
-	Axis 4 parallel / antiparallel to the last basic axis	DWORD	NEW CONF
-			
-	-	0	0
-	-	1	7/2
-	-		M

Description: This machine data identifies whether the 4th axis is parallel / antiparallel to the last rotary basic axis.

This machine data only applies for kinematics with more than 3 axes.

- Axis 4 is parallel / antiparallel: 1
- Axis 4 is not parallel: 0

62607	TRAFO6_MAIN_LENGTH_AB	-	-
mm	Basic axis length A and B, n = 0...1	DOUBLE	NEW CONF
-			
-	2	0.0, 500.0	-
-	-		7/2
-	-		M

Description: This machine data identifies the basic axis lengths A and B. These lengths are particularly defined for each basic axis type.

- n = 0: basic axis length A
- n = 1: basic axis length B

62608	TRAFO6_TX3P3_POS	-	-
mm	Attachment of the hand (position share), n = 0...2	DOUBLE	NEW CONF
-			
-	3	0.0, 0.0, 0.0	-
-	-		7/2
-	-		M

Description: This machine data identifies the position share of frame TX3P3 connecting the basic axes with the hand.

- Index 0: X component
- Index 1: Y component
- Index 2: Z component

62609	TRAFO6_TX3P3_RPY	-	-
degrees	Attachment of the hand (rotation share), n = 0...2	DOUBLE	NEW CONF
-			
-	3	0.0, 0.0, 0.0	-
-	-		7/2
-	-		M

Description: This machine data identifies the orientation share of frame TX3P3 connecting the basic axes with the hand.

2.6 Compile cycles

- Index 0: rotation with RPY angle A
- Index 1: rotation with RPY angle B
- Index 2: rotation with RPY angle C

62610	TRAFO6_TFLWP_POS	-	-
mm	Frame between hand pt. and flange coordinate system, n = 0...2	DOUBLE	NEW CONF
-			
-	3	0.0, 0.0, 0.0	-

Description: This machine data identifies the position share of frame TFLWP that connects the hand point with the flange.

- Index 0: X component
- Index 1: Y component
- Index 2: Z component

62611	TRAFO6_TFLWP_RPY	-	-
degrees	Frame between hand point and flange coordinate system, n = 0...2	DOUBLE	NEW CONF
-			
-	3	0.0, 0.0, 0.0	-

Description: This machine data identifies the orientation share of frame TFLWP that connects the hand point with the flange.

- Index 0: rotation with RPY angle A
- Index 1: rotation with RPY angle B
- Index 2: rotation with RPY angle C

62612	TRAFO6_TIRORO_POS	-	-
mm	Frame between foot pt. and int. coordinate system, n = 0...2	DOUBLE	NEW CONF
-			
-	3	0.0, 0.0, 0.0	-

Description: This machine data identifies the position share of frame TIRORO that connects the basic coordinate system with the internal transformation coordinate system.

- Index 0: X component
- Index 1: Y component
- Index 2: Z component

62613	TRAFO6_TIRORO_RPY	-	-
degrees	Frame between foot pt. and int. coordinate system, n = 0...2	DOUBLE	NEW CONF
-			
-	3	0.0, 0.0, 0.0	-

Description: This machine data identifies the orientation share of frame TIRORO that connects the basic coordinate system with the internal transformation coordinate system.

- Index 0: rotation with RPY angle A
- Index 1: rotation with RPY angle B
- Index 2: rotation with RPY angle C

62614	TRAFO6_DHPAR4_5A	-	-
mm	Parameter A for configuration of the hand, n = 0...1	DOUBLE	NEW CONF
-			
-	2	0.0, 0.0	-

Description: This machine data identifies length a.

- n = 0: transition axis 4 to 5
- n = 1: transition axis 5 to 6

62615	TRAFO6_DHPAR4_5D			-	-	
mm	Parameter D for configuration of the hand, n = 0...1			DOUBLE	NEW CONF	
-						
-	2	0.0, 0.0	-	-	7/2	M

Description: This machine data identifies length d.

- n = 0: transition axis 4 to 5
- n = 1: transition axis 5 to 6

62616	TRAFO6_DHPAR4_5ALPHA			-	-	
degrees	Parameter ALPHA for configuration of the hand, n = 0...1			DOUBLE	NEW CONF	
-						
-	2	-90.0, 90.0	-	-	7/2	M

Description: This machine data identifies angle alpha

- n = 0: transition axis 4 to 5
- n = 1: transition axis 5 to 6

62617	TRAFO6_MAMES			-	-	
-	Offset of math. to mech. zero point [axis no.]: 0...5			DOUBLE	NEW CONF	
-						
-	6	0.0, 0.0, 0.0, 0.0, 0.0, 0.0	-	-	7/2	M

Description: This machine data can specify an adjustment of the zero point for a rotary axis to the mathematical zero point specified by the transformation.

Based on the mechanical zero point the offset is hereby related to the mathematically positive direction of axis rotation.

62618	TRAFO6_AXES_DIR			-	-	
-	Adjustm. of the phys. and math. dir. of rot. [axis no.]: 0...5			DWORD	NEW CONF	
-						
-	6	1, 1, 1, 1, 1, 1	-1	1	7/2	M

Description: This machine data can adjust the mathematical and physical direction of rotation of the axes.

- +1: same direction of rotation
- -1: different direction of rotation

62619	TRAFO6_DIS_WRP			-	-	
mm	Medium distance between hand point and singularity			DOUBLE	NEW CONF	
-						
-	-	10.0	0.00001	999999.9999	7/2	M

Description: Through this machine data a limit value for the distance between the hand point and the singularity can be entered.

Inactive!

62620	TRAFO6_AXIS_SEQ			-	-	
-	Axis reorganization			DWORD	NEW CONF	
-						
-	6	1, 2, 3, 4, 5, 6	1	6	7/2	M

2.6 Compile cycles

Description: This machine data can reverse the order of the axes in order to internally transfer a kinematic system into a standard kinematic system.

62621	TRAFO6_SPIN_ON	-	-
-	Triangular or acme-screw spindles available	DWORD	NEW CONF
-			
-	-	0	0
-		1	7/2
-			M

Description: This machine data identifies whether triangular spindles or acme connections are available.

- 0: not available
- 1: available

This function is currently not supported.

MD62621 must be set to 0. Machine data MD62622 through MD62628 are thus inactive!

62622	TRAFO6_SPIND_AXIS	-	-
-	Axis on which the triangular spindle has an effect, n = 0...2	DWORD	NEW CONF
-			
-	3	0, 0, 0	-
-		-	7/2
-			M

Description: This machine data identifies for which axis a triangular spindle is active. A maximum of 3 triangular spindles may be available.

- n = 0: 1st triangular axis
- n = 1: 2nd triangular axis
- n = 2: 3rd triangular axis

62623	TRAFO6_SPINDLE_RAD_G	-	-
mm	Length G for triangular spindle, n = 0...2	DOUBLE	NEW CONF
-			
-	3	0.0, 0.0, 0.0	-
-		-	7/2
-			M

Description: This machine data identifies length G for the n-th triangular spindle.

62624	TRAFO6_SPINDLE_RAD_H	-	-
mm	Length H for triangular spindle, n = 0...2	DOUBLE	NEW CONF
-			
-	3	0.0, 0.0, 0.0	-
-		-	7/2
-			M

Description: This machine data identifies length H for the n-th triangular spindle.

62625	TRAFO6_SPINDLE_SIGN	-	-
-	Sign for triangular spindle, n = 0...2	DWORD	NEW CONF
-			
-	3	1, 1, 1	-1
-		1	7/2
-			M

Description: This machine data identifies the sign for the adjustment of the direction of rotation for the n-th triangular spindle.

62626	TRAFO6_SPINDLE_BETA	-	-
degrees	Angular offset for triangular spindles, n = 0...2	DOUBLE	NEW CONF
-			
-	3	0.0, 0.0, 0.0	-
-		-	7/2
-			M

Description: This machine data identifies offset angle b for adjustment of the zero point for the n-th triangular spindle.

62627	TRAFO6_TRP_SPIND_AXIS			-	-	
-	Axes driven by acme spindle, n = 0...1			DWORD	NEW CONF	
-						
-	2	0, 0	-	-	7/2	M

Description: This machine data identifies which axes are driven by an acme connection.

- n = 0: axis driven by an acme
- n = 1: coupling axis

62628	TRAFO6_TRP_SPIND_LEN			-	-	
mm	Acme length, n = 0...3			DOUBLE	NEW CONF	
-						
-	4	0.0, 0.0, 0.0, 0.0	-	-	7/2	M

Description: This machine data specifies the lengths of the acme connection.

62629	TRAFO6_VELCP			-	-	
mm/min	Cartesian velocity [no.]: 0...2			DOUBLE	Immediately	
-						
-	3	600000.0, 600000.0, 600000.0	-	-	7/2	M

Description: This machine data can specify a velocity for the Cartesian directions of traversing blocks with G0.

- n = 0: velocity in X direction
- n = 1: velocity in Y direction
- n = 2: velocity in Z direction

62630	TRAFO6_ACCCP			-	-	
m/s²	Cartesian accelerations [no.]: 0...2			DOUBLE	Immediately	
-						
-	3	0.5, 0.5, 0.5	0.001	100000	7/2	M

Description: This machine data can specify an acceleration for the Cartesian directions of traversing blocks with G0.

- n = 0: velocity in X direction
- n = 1: velocity in Y direction
- n = 2: velocity in Z direction

62631	TRAFO6_VELORI			-	-	
rev/min	Orientation angle velocities [no.]: 0...2			DOUBLE	Immediately	
-						
-	3	1.6666, 1.6666, 1.6666	-	-	7/2	M

Description: This machine data can specify a velocity for the orientation angles of traversing blocks with G0.

- n = 0: velocity angle A
- n = 1: velocity angle B
- n = 2: velocity angle C

2.6 Compile cycles

62632	TRAFO6_ACCORI			-	-	
rev/s²	Orientation angle accelerations [no.]: 0...2			DOUBLE	Immediately	
-						
-	3	0.00277, 0.00277, 0.00277	0.001	100000	7/2	M

Description: This machine data can specify an acceleration for the orientation angles of traversing blocks with G0.

- n = 0: velocity angle A
- n = 1: velocity angle B
- n = 2: velocity angle C

62634	TRAFO6_DYN_LIM_REDUCE			-	-	
-	Reduction factor for velocity controller			DOUBLE	NEW CONF	
-						
-	-	1.0	0.001	1.0	7/2	M

Description: This MD can be used to specify a reserve for the maximum velocity, so that an excessive increase in the velocity by the velocity controller will not cause the maximum velocity to be exceeded.

The value must be regarded as a factor that has an effect on the maximum velocity.

62635	TRAFO6_VEL_FILTER_TIME			-	-	
s	Time constant for velocity controller			DOUBLE	NEW CONF	
-						
-	-	0.024	0.0	100.0	7/2	M

Description: This MD can be used to set the time constant for the velocity controller in the interpolator. This can avoid controller vibration.

62636	TRAFO6_TFL_EXT_RPY			-	-	
degrees	Frame for rotating the flange coordinate system, n = 0...2			DOUBLE	NEW CONF	
-						
-	3	0.0, 0.0, 0.0	-	-	7/2	M

Description: For machines with 5 axes it was specified that the flange coordinate system must be aligned such that the tool is oriented in the X direction (robotics convention).
With the machine data TRAFO6_TFL_EXT_RPY, the flange coordinate system can be aligned such that for a machine with 5 axes a tool direction in accordance with the NC convention is achieved (tool orientation in the Z direction).

- Index 0: Rotation by the RPY angle A
- Index 1: Rotation by the RPY angle B
- Index 2: Rotation by the RPY angle C

62637	TRAFO6_TOOL_DIR			-	-	
-	Definition of tool direction			DWORD	NEW CONF	
-						
-	-	0	0	1	7/2	M

Description: This machine data identifies the tool direction for a machine with 5/6 axes

- 0: Tool orientation in the X direction (robotics convention)
- 1: Tool orientation in the Z direction (NC convention)

This machine data also affects how the rotation sequence of the virtual orientation axes is interpreted and calculated in the Handling Transformation.

- 0: Rotation sequence: 1st rotation around Z, 2nd rotation around Y', 3rd rotation around X" (does not apply for 5-axis machines)
- 1: Rotation sequence: 1st rotation around X, 2nd rotation around Y', 3rd rotation around Z" (does not apply for 5-axis machines)

62642	TRAFO6_C_ANGLE_AOFFSET	-	-
degrees	Offset angle for C-angle calculation in the BCS	DOUBLE	NEW CONF
-			
-	-	0.0	-
			7/2
			M

Description: This machine data can be used to specify an offset angle for calculating the C-angle in the BCS for 4-axis SCARA kinematics.

62643	TRAFO6_SPECIAL_FEATURE_MASK	-	-
-	Activating special features	DWORD	Reset
-			
-	-	0	-
			7/2
			M

Description: This machine data enables special features to be activated.
 Bit 0 = 0: For 4-axis SCARA kinematics, the C-angle is controlled in the BCS in the range between -180 degrees and +180 degrees.
 Bit 0 = 1: For 4-axis SCARA kinematics, the C-angle is controlled absolutely in the BCS.

63514	CC_PROTECT_ACCEL	-	-
m/s ² , rev/s ²	PROT braking acceleration in the case of collision	DOUBLE	Reset
-			
-	-	1000.0	1.0
			10000.0
			7/2
			M

Description: If the axis collision protection function PROT has detected a collision, the involved axes are braked using the acceleration set in this machine data.
 Recommended setting: a few per cent higher than 32300__\$MA_MAX_AX_ACCEL, provided that the dimensioning of the drive and the mechanical system allow it.
 Notice: the braking acceleration set here always has a BRISK effect independently of other parameterizations (e.g. parameter set, active dyn. G code)

63540	CC_MASTER_AXIS	-	-
-	Indicates the corresponding CC_Master axis for a CC_Slave axis	DWORD	Reset
-			
-	-	0	0
			CC_MAXNUM_A XES_IN_SYSTE M
			7/2
			M

Description: By assigning a valid CC_Master axis in this machine data, the relevant axis is defined as the CC-Slave axis of an MCS coupling. The assignment is made by entering the machine axis number of the CC_Master axis.
 The machine axis number and the axis name must be taken from the channel-specific machine data:

- 20070 \$MC_AXCONF_MACHAX_USED
- 20080 \$MC_AXCONF_CHANAX_NAME_TAB

Notice:
 CC_Master and CC_Slave must have the same axis type (linear or rotary axis).
 CC_Master and CC_Slave must not be a spindle.
 CC_Master and CC_Slave must not be replacement axes.
 If the axes show different dynamic response, it is recommended you make the axis with the lower dynamics the CC_Master axis.
 The machine data may be changed only when the coupling has been switched off.

2.6 Compile cycles

63541	CC_POSITION_TOL			-	-	
mm, degrees	Monitoring window (only relevant to a CC_Slave axis)			DOUBLE	Reset	
-						
-	-	0.0	-	-	7/2	M

Description: Monitoring window of the MCS coupling. Only the entry in the machine data of the CC_Slave axis is evaluated. The difference of the actual values between the CC_Master and CC_Slave must always range within this window. Otherwise an alarm will be output. The following condition is monitored:

$$\text{abs}(\text{ActualPos}[\text{CC_Master}] - (\text{ActualPos}[\text{CC_Slave}] + \text{CC_Offset})) \leq \text{MD63541}$$

with:

CC_Offset = position difference between CC_Master and CC_Slave when switching on the coupling.

Monitoring is switched off by entering value 0.0

63542	CC_PROTECT_MASTER			-	-	
-	Indicates the corresponding PMaster axis for a PSlave axis			DWORD	Reset	
-						
-	-	0	0	CC_MAXNUM_AXES_IN_SYSTEM	7/2	M

Description: By assigning a valid Protect-Master axis in this machine data the relevant axis is defined as the Protect-Slave axis. Assignment is made by entering the machine axis number of the Protect-Master axis.

The machine axis and the axis name must be taken from the channel-specific machine data:

- MD20070 \$MC_AXCONF_MACHAX_USED[n-1]
- MD20080 \$MC_AXCONF_CHANAX_NAME_TAB

Notice:

Protect-Master and Protect-Slave axis must have the same axis type (linear or rotary axis).

63543	CC_PROTECT_OPTIONS			-	-	
-	Configuration of the collision protection function			DWORD	Reset	
-						
-	-	0	0	0xFF	7/2	M

Description: The collision protection function can be adapted to the special situation by setting the following:

Bit 0 - bit 3 for Protect-Master and Protect-Slave

Bit 0 = 1:

Retraction in PLUS

Bit 1 = 1:

Braking to avoid collision is made by increasing the max. braking acceleration by factor 1.2

Bit 2 = 1:

Monitoring can be activated even without a referenced axis

Bit 3 = 1

Reverse the direction of retraction, if the axis is the master axis

Bit 4 - bit 7 only relevant to Protect-Slave

Bit 4 = 1:

Monitoring always active (otherwise ON/OFF via PLC)

Bit 5
 Reserve
 Bit6
 Reserve
 Bit 7=1:
 Display active protection in DB3x, DBX66.0

63544	CC_COLLISION_WIN	-	-
mm, degrees	Collision protection window	DOUBLE	Reset
-			
-	-	-1.0	-

Description: Minimum distance between the Protect-Slave axis and the Protect-Master axis. Only the value entered in the Slave axis is used. With a value smaller than 0, the monitoring function cannot be activated.

63545	CC_OFFSET_MASTER	-	-
mm, degrees	Work offset for collision protection	DOUBLE	PowerOn
-			
-	-	0.0	-

Description: Work offset for collision detection between Protect-Slave and Protect-Master axis. The value entered for the Protect-Slave axis is used only.

SINAMICS parameters

3.1 Explanation of the parameters

3.1.1 Structure of the data tables

Basic structure of the parameter description

The tables of SINAMICS parameters all have the following standard structure:

Parameter number	BICO: Full parameter name / short parameter name		
Drive object (function module)	Can be changed:	Calculated:	Access level:
	Data type:	Dynamic index:	Function diagram:
	P group:	Unit group:	Unit selection:
	Not for motor type:	Normalizing	Expert list:
	Min.	Max.	Factory setting

Example

r0025[0...3]	CO: Input voltage, smoothed		
A_INF, S_INF	Can be changed: -	Calculated: -	Access level: 2
	Data type: FloatingPoint32	Dynamic index:	Function diagram: 8850, 8950
	P group: Display, signals	Unit group: -	Unit selection: -
	Not for motor type: -	Normalization p2001	Expert list: 1
	Min - [Vrms]	Max - [Vrms]	Factory setting - [Vrms]

References

You can find a detailed description of SINAMICS parameters in the following document:
SINAMICS S120/S150 List Manual

3.1.2 Meaning of table fields

Parameter number pxxxx[0...n]

The "parameter number" field contains the number of the parameter.

3.1 Explanation of the parameters

The number is made up of a "p" or "r", followed by the parameter number and optionally the index or bit array.

Below are some examples of how the number is represented in the parameter list:

p...	Adjustable parameter (read and write parameter)
r...	Display parameter (read-only)
p0918	Adjustable parameter 918
p0608[0...3]	Adjustable parameter 608, indices 0 to 3
p0610[0...n]	Adjustable parameter 6010, indices 0 to n (n = configurable)
r0944	Display parameter 944
r2129.0...15	Display parameter 2129 with bit array from bit 0 (lowest bit) to bit 15 (highest bit)

BICO: Full parameter name / short parameter name

The following abbreviations can appear in front of the parameter name:

BI:	Binector Input This parameter selects the source of a digital signal.
BO:	Binector Output This parameter is available as an digital signal for interconnection with other parameters.
CI:	Connector Input This parameter selects the source of an "analog" signal.
CO:	Connector Output This parameter is available as an "analog" signal for interconnection with other parameters.
CO/BO:	Connector/Binector Output Connector/Binector Output This parameter is available as both an "analog" and also as digital signals for interconnection with other parameters.

Drive object (function module)

A drive object (DO) is an independent, "self-contained" functional unit with its own parameters, faults messages, and alarms.

The parameter list specifies the associated drive object and function module for each individual parameter.

Additional information is available in the following documentation: /FM1/ Function Manual
SINAMICS S120 Drive Functions

Can be changed

The "-" sign indicates that the parameter can be changed in any object state and that the change will be activated immediately.

The information C1(x), C2(x), T, U ((x): optional) means that the parameter can be changed only in the specified drive object state and that the change will not be activated until the object switches to another state. This can be one or more states.

The following states are available:

C1(x)	Device commissioning	C1: Commissioning 1
	Device is in the process of being commissioned (p0009 > 0).	
	The pulses cannot be enabled.	
	The parameter can only be changed when the device commissioning settings (p0009 > 0) are as follows:	
	• C1: can be changed for all settings p0009 > 0. • C1(x): can only be changed for the settings p0009 = x.	
	A modified parameter value will not be activated until the device commissioning mode is exited with p0009 = 0.	
C2(x)	Drive object commissioning	C2: Commissioning 2
	The drive is in the process of being commissioned (p0009 = 0 and p0010 > 0).	
	The pulses cannot be enabled.	
	The parameter can only be changed in the following device commissioning settings (p0010 > 0):	
	• C2: can be changed for all settings p0010 > 0. • C2(x): can be changed for the settings p0010 = x.	
	A modified parameter value will not be activated until drive commissioning mode is exited with p0010 = 0	
U	Operation	U: Run
	The pulses are enabled	
T	Ready	T: Ready to run
	The pulses are not enabled Status "C1(x)" or "C2(x)" is not active.	

Calculated

Specifies whether the parameter is influenced by automatic calculations.

The calculation attribute defines which activities influence the parameter.

Access level

Specifies the access level required to be able to display and change this parameter. The required access level can be set using p0003.

The system uses the following access levels:

1. Standard
2. Extended
3. Expert
4. Service

Data type

The information on the data type can consist of the following two items (separated by a slash).

- First information
Data type of the parameter.
- Second information (for binector or connector input only)
Data type of the signal source to be interconnected (binector/connector output).

Parameters can have the following data types:

I8	Integer8	8-bit integer number
I16	Integer16	16-bit integer number
I32	Integer32	32-bit integer number
U8	Unsigned8	8 bits without sign
U16	Unsigned16	16 bits without sign
U32	Unsigned32	32 bits without sign
Float	FloatingPoint32	32-bit floating point number

Dynamic index

For parameters with a dynamic index [0 to n], the following information is specified:

- Data set (if available).
- Parameter for the number of indices ($n = \text{number} - 1$).

Function diagram

The parameter is included in this function diagram. The structure of the parameter function and its relationship with other parameters are shown in the function diagram.

The function diagrams are available in the following documentation:

/LH1/ SINAMICS S120/S150 List Manual

P group

Specifies the functional group to which this parameter belongs. The required parameter group can be set via p0004.

Unit, unit group, unit selection

The standard unit of a parameter is specified in square brackets after the values for "Min", "Max", and "Factory setting".

For parameters where the unit can be changed, "Unit Group" and "Unit Selection" specify which group this parameter belongs and which parameter can be used to change the unit.

Not for motor type

Specifies for which motor type this parameter has no significance

ASM	Induction motor
PMSM	Permanent-magnet synchronous motor
REL	Reluctance motor/SIEMOSYN motor
RESM	Synchronous reluctance motor
SESM	Separately excited synchronous motor

Normalizing

Specification of the reference variable with which a signal value is automatically converted for a BICO interconnection.

The following reference variables are possible:

p2000 ... p2007:	Reference speed, reference voltage, etc.
TEMP:	100°C = 100%
PERCENT:	1.0 = 100%
4000H:	4000 hex = 100 %
p0514:	Specific normalization
	See description for p0514[0...9] to p0524[0...19]

Expert list

Specifies whether this parameter is available in the expert list of the specified drive objects in the commissioning software.

- 1: Parameter does exist in the expert list.
0: Parameter does not exist in the expert list

3.1.3 Number ranges of the parameters**Number ranges**

Parameters are grouped into the following number ranges:

Range		Description
From	to	
0000	0099	Display and operation
0100	0199	Commissioning
0200	0299	Power unit
0300	0399	Motor
0400	0499	Encoder

3.1 Explanation of the parameters

Range		Description
From	to	
0500	0599	Technology and units, motor-specific data, probes
0600	0699	Thermal monitoring, maximum current, operating hours, motor data, central probe
0700	0799	Control Unit terminals, measuring sockets
0800	0839	CDS, DDS data sets, motor changeover
0840	0879	Sequence control (e.g. signal source for ON/OFF1)
0880	0899	ESR, parking, control and status words
0900	0999	PROFIBUS/PROFIdrive
1000	1199	Setpoint channel (e.g. ramp-function generator)
1200	1299	Functions (e.g. motor holding brake)
1300	1399	U/f control
1400	1799	Closed-loop control
1800	1899	Gating unit
1900	1999	Power unit and motor identification
2000	2009	Reference values
2010	2099	Communication (fieldbus)
2100	2139	Faults and alarms
2140	2199	Signals and monitoring
2200	2359	Technology controller
2360	2399	Staging, hibernation
2500	2699	Position control (LR) and basic positioning (EPOS)
2700	2719	Reference values, display
2720	2729	Load gearbox
2800	2819	Logic operations
2900	2930	Fixed values (e.g. percent, torque)
3000	3099	Motor identification results
3100	3109	Real-time clock (RTC)
3110	3199	Faults and alarms
3200	3299	Signals and monitoring
3400	3659	Infeed closed-loop control
3660	3699	Voltage Sensing Module (VSM), Braking Module internal
3700	3779	Advanced Positioning Control (APC)
3780	3819	Synchronization
3820	3849	Friction characteristic
3850	3899	Functions (e.g. long stator)
3900	3999	Management
4000	4599	Terminal Board, Terminal Module (e.g. TB30, TM31)
4600	4699	Sensor Module
4700	4799	Trace
4800	4849	Function Generator
4950	4999	Technology Extension
5000	5169	Spindle diagnostics

Range		Description
From	to	
5200	5230	Current setpoint filter 5 ... 10 (r0108.21)
5400	5499	Line droop control (e.g. shaft generator)
5500	5599	Dynamic grid support (solar)
5600	5913	PROFenergy
5900	6999	SINAMICS GM/SM/GL/SL
7000	7499	Parallel connection of power units
7500	7599	SINAMICS SM120
7700	7729	External messages
7770	7789	NVRAM, system parameters
7800	7839	EEPROM read/write parameters
7840	8399	Internal system parameters
8400	8449	Real-time clock (RTC)
8500	8599	Data and macro management
8600	8799	CAN bus
8800	8899	Communication Board Ethernet (CBE), PROFIdrive
8900	8999	Industrial Ethernet, PROFINET, CBE20
9000	9299	Topology
9300	9399	Safety Integrated
9400	9499	Parameter consistency and storage
9500	9899	Safety Integrated
9900	9949	Topology
9950	9999	Diagnostics, internal
10000	10199	Safety Integrated
11000	11299	Free technology controller 0, 1, 2
20000	20999	Free function blocks (FBLOCKS)
21000	25999	Drive Control Chart (DCC)
50000	53999	SINAMICS DC MASTER (DC closed-loop control)
61000	61001	PROFINET

3.2 SINAMICS parameters

All objects: A_INF, A_INF_840, B_INF, B_INF_840, CU_I_840, CU_LINK, CU_NX_840, CU_S_AC_DP, CU_S_AC_PN, CU_S120_DP, CU_S120_PN, ENC, ENC_840, HLA, HLA_840, HLA_DBSI, HUB, R_INF, S_INF, S_INF_840, SERVO, SERVO_840, SERVO_AC, SERVO_DBSI, TB30, TM120, TM15, TM150, TM15DI_DO, TM17, TM31, TM41, TM54F_MA, TM54F_SL, VECTOR, VECTOR_AC

r0002 CU_I_840, CU_NX_840, CU_S_AC_DP, CU_S_AC_PN, CU_S120_DP, CU_S120_PN	Control Unit operating display / CU op_display Can be changed: - Data type: Integer16 P-Group: - Not for motor type: - Min: 0	Calculated: - Dynamic index: - Unit group: - Scaling: - Max: 117	Access level: 1 Function diagram: - Unit selection: - Expert list: 1 Factory setting: -
